

Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

- + *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.
- + *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.
- + *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.
- + *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página <http://books.google.com>

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

ELECTRICITY,

A Popular Electrical and Financial Journal.

PUBLISHED WEEKLY BY

Electricity Newspaper Co.,

136 LIBERTY STREET,

NEW YORK.

VOLUME XIV.

Nos. 1 to 26 inclusive.

JANUARY 12, 1898, TO JULY 6, 1898.

INDEX TO ELECTRICITY.

VOLUME XIV—NOS. 1 TO 26 INCLUSIVE.

JANUARY 12, 1898—JULY 6, 1898.

A

Alternate Current Motors, 152.
Alternating Currents and Direct Currents in Lighting, etc. (Discussion), 407.
Amateur Model Making Competition at the Electrical and Kindred Industries Exhibition, 152.
American Association of Inventors and Manufacturers, 10.
An Important Deal Closed, 265.
An Improved Sand Box, 139.
Annual Meeting of the Joseph Dixon Crucible Co., 265.
Annual Meeting of G. E. Co., 281.
Attendants at the N. E. L. A. Convention, 359.

AUTHORS:—

Adams, W. P. (A. I. E. E.), A Survey of the Possibilities of Electrical Heating and Cooking, 117, 133.
Andrews, Leonard, The Prevention of Interruptions to Electricity Supply, 341.
Appleyard, Rollo, Electrical Alloys, 325.
Badt, Lieut. Francois A., Topics of Interest to Central Station Men, 86.
Barbarat, A., Electric Cables With Dry-Air Circulation, 328.
Birkeland, M., On the Cathode Ray Spectrum, 329.
Bleyer, J. Mount, The X-Rays and their Safe Application, 361.
Bouty, E., New Method of Measuring the Intensity of Magnetic Fields, 245.
Byng, G. Binswanger, On the Manufacture of Lamps and Other Apparatus for 200-Volt Circuits, 150.
Clarke, W. G., Wireless Telegraphy, 227, 247, 278.
Cowper-Coles, Sherard, An Electrolytic Process for the Manufacturing of Parabolic Reflectors, 119, 134; Electrolytic Refining of Lead, 294.
Cutler, Harry H., The Regulation and Protection of the Electric Motor, 215.
Diendonne, Emile, System for Protection of Railway Trains, 280.
Dow, Alex., Electric Lighting for Profit, 100.
Edgar, W. H., Physical and Chemical Properties of Volatile Oils in Boilers, 70.
Ewing, Prof. J. A., A Magnetic Balance for Workshop Tests of Permeability, 309.
Fessenden, Reginald A., Insulation and Conduction, 182, 197, 213.
Ferguson, Louis A., General Distribution from Central Stations by Direct Currents, 357, 403.
Gage, Channing T., Biography of a Piece of Copper Wire, 199.
Greene, S. Dana, The Relations Between the Customer, Consulting Engineer and the Electrical Manufacturer, 20.
Hallberg, J. H., A Novel High Tension Series Enclosed Arc System, 184.
Hamelin, G., Electrically Operated Movable Platforms for the Universal Exposition at Paris, 165.
Harrington, Walter E., Railway Bonding, 22.
Hedenberg, W. L., What Electrolyzed Sea Water has Accomplished, 296.
Hedley, W. S. M.D., Death by Electricity, 149.
Jorignot, C., New System of Electric Traction by Alternating Currents, 200.
Kershaw, J. B. C., The Electro-Chemical and Electro-Metallurgical Industries of Europe, 5, 55, 85, 116, 196, 244, 280, 293, 311, 344.
Laffargue, J., The Distribution of Electrical Energy in Paris, 300, 327, 377, 392.

Liebenlow, C., The Calculations of the Electrical Resistances of Alloys and their Application to the Finding of Alloys of Definite Electrical Properties, 69, 83, 100.

Niblett, J. T., Some Recent Improvements in Accumulators and their Application to Traction on Common Roads, 230.
Owens, Prof. R. B., Electricity in Municipal Engineering, 52.
Powell, Leigh S., Carbonization of Filaments by Electricity, 323.
Preece, W. H., On the Abuse of Power Houses, 393.
Price, W. A., Shielded Conductors, 71.
Randall, John E., The Present Efficiency of Incandescent Lamps, 52.
Ridley, A. E. Brooke, Garbage Destructors, 277.
Rice, Calvin W., Analysis of the Cost of the Generation and Distribution of a Unit of Electricity, 371.
Routin, J. L., Unipolar Self-Exciting Alternator, 38.
Von Kodolitsch, Riveting by Electricity, 265.
Wagner, Herbert A., General Distribution from Central Stations by Alternating Currents, 389, 405.
Wright, J., The Insulation of Electrical Testing Instruments, 22.

B

Beautiful St. John's River, The, 139.
Bids Wanted, 105.
Bids Wanted for Telegraph Material, 265.
BOOK REVIEWS:—
Arithmetic of the Steam Engine, by E. Sherman Gould, 9.
Mechanical Draft, by B. F. Sturtevant, 9.
Motor Engineer's and Electrical Worker's Handbook, by Wm. Lintern, 57.
Anderson's Physical Education, by W. Gilbert Anderson, 57.
A Pocket Dictionary of Electrical Words, Terms and Phrases, by Edwin J. Houston, 152.
Algebra Made Easy, by Edwin J. Houston and Arthur Kennelly, 152.
The Universal Electrical Directory, by J. A. Berly, 152.
Modern Switchboards, by Albert B. Herrick, 232.
Brake in Railway Service, The, 123.
Brush Electric Light Stock Suit, 24.
Business Changes, 107.

C

CANADIAN NOTES:—
Pages 9, 25, 73, 153, 169, 233, 266, 296, 313, 330, 362, 394.
Cathode and Roentgen Rays, 105.
Changing Alternating to Direct Current, 68.
Cheap Telephone Lines, 3.
Chicago Convention, 355.
Chicago Electrical Association, 73.
Clontarf Electric Tramway, 6.
COMMUNICATIONS:—
The Warren Electric Co., receivership, 153.
The Firman Patent, 195.
Congressional Notes, 24, 201.
Cork Electric Tramway, 295.
Costly Litigation, 212.
Creating an Electrical Town, 54.

COMMERCIAL PARAGRAPHS:—

Pages 11, 27, 43, 59, 75, 91, 107, 123, 139, 155, 171, 187, 203, 219, 235, 251, 267, 283, 299, 315, 331, 347, 364, 380, 395, 411.

D

Desirable Books, 74.
Drawbacks—The Kind to Get, 89.
Draw Your Dividends, 55.
Dublin Three-Phase System, 152.

E

EDITORIAL NOTES:—

Amendment to Patent Laws, 193.
An Electrically Propelled Cruiser, 241.
An Electric Fire Engine, 290.
An Electric Ice Boat, 66.
Another Vacuum Tube Light, 162.
Another Patent Decision Against the G. E. Co., 294.
Another Important Patent Decision, 337.
Another Startling Invention, 385.
Automobile Exposition in Paris, The, 385.
Cast Iron as an Insulator, 65.
Changes in the Patent Office, 354.
Como International Exhibition of Electricity, The, 401.
Conference of the Union for the Protection of Industrial Property, 242.
Courts End the Trust Monopoly, 209.
Diesel Motor, The, 114.
Early Application of Electricity to Submarine Mines, 241.
Effect of War on the Electrical Industry, 258.
Electric Headlights, 93.
Electric Fish Torpedoes, 146.
Electric Light in Italy, 338.
Electric Semaphore Signals, 66.
Electrical Equipment of the Alabama, 386.
Electrical Exhibition, 210, 290.
Electrical Resistance of Alloys, The, 65.
Electrical War Inventions Pouring into the Patent Office, 26.
Electricity and Trunk Line Railroads, 33.
Electricity for Consumption, 50.
Electricity for the Elevated Roads, 17.
Electricity from the Earth, 33.
Future Fields for Electricity, 178.
Garbage Destructors, 274.
General Electric, 257.
General Electric Stock Problem, 369.
General Opinion Regarding Sixth Annual Report, 273.
Greene's, S. Dana, Paper, 18.
Holland Submarine Boat, The, 178.
Incandescent Lamps, 237.
Kite Telephoning, 370.
Locating Submarine Mines by Means of the Teleautograph, 210.
Long Distance Submarine Telephoning, 162.
Low Cost of Steam Power in Buffalo, 129.
Milwaukee Convention, 34.
Movable Electric Bridge, A, 32.
Municipal vs. Private Ownership, 97.
National Electric Light Convention, 305, 338, 354.
New Electric Conduit System, 193.
New England Gas & Coke Co., 145.
New Method of Insulating an Electric Current, 50.
New Trolley Systems and Snow, The, 82.
New York Electrical Society, 18.
Northwestern Electrical Convention, 274, 369.
Novel Electric Railways, 1.

Opening of the Electrical Exhibition, 257.
 Paris Exposition of 1900, The, 162.
 Philadelphia Exhibition, 386.
 Power Rates of the Cataract & Conduit Co., 226.
 Prize Offer, A, 1.
 Proposed Pan-American Exposition, The, 289.
 Roentgen Rays in Warfare, 402.
 Searchlights, 194.
 Several New Illuminants, 34.
 Startling Theory as to Electricity, 81.
 Steel Foundations of Buildings and Electrolysis, 225.
 Street Railways and Municipalities, 146.
 Submarine Cable Cutting, 354.
 Submarine Mines and Electricity, 113.
 Summer Convention of the Northwestern Electrical Association, 321.
 Technical Education, 129.
 Telephone Bill at Albany, 130.
 Telectroscope, The, 177.
 Telephone Charges, 2.
 Trans-Mississippi and International Exposition, The, 209.
 Trolley for Chicago River, Proposed, 2.
 United States Export Trade, The, 401.
 Uses to which the Telephone is Put, 322.
 Valuable Papers Stolen, 98.
 War Revenue Bill, A, 306.
 War of Science, A, 305.
 Wave and Tide Motors, 194.
 Wind as a Motive Power, 81.
 Wonderful Electric Gun, 18.
 Would-be Blow at Trusts, 306.
 Effect of the War on General Industry, 297.
 Electric Engineering at Columbia University, 131.
 Electric Equipment of the Maine, 135.
 Electric Light Dimmers, 35.
 Electric Lighting of Powder Magazines, 68.
 Electric Lighting of the Thames Embankment, 73.
 Electric Lighting in London, 73.
 Electric Lighting of Trains in India, 246.
 Electric Lighting of Mail Cars in Germany, 198.
 Electric Lighting in Berlin and Paris, 389.
 Electric Mail Cars, 73.
 Electric Opportunities in Peru, 405.
 Electric Plant at West Point Academy, The, 297.
 Electric Power Schemes, 56.
 Electric Progress in Corea, 195.
 Electric Projects in France, 149.
 Electric Railways of Canada, The, 19.
 Electric Railway Projects Abroad, 250.
 Electric Tramways in Cork, 4.
 Electric Tramways in Europe, 105.
 Electric Tramway Schemes, 56.
 Electricity in Coal Pits, 195.
 Electricity in the Hotel and Home, 295.
 Electricity in Municipal Engineering, 53.
 Electricity Supply in Eng'nd, 231, 243.
 Electrical Appliances in South Africa, 329.
 Electrical Applications Awaiting Action in the Patent Office, 105.
 Electrical Apparatus for Great Gull Island, 105.
 Electrical Exhibition, 73, 163, 212, 227, 249, 307.
 Electrical Exhibition, The; a Personal Exhibit by Prof. S. H. Short, 73.
 Electrical Engineering in Spain, 151.
 Electrical Engineering Schools, United, 212.
 Electrical Exports, 9.
 Electrical Show, 8, 73, 168, 195, 212, 227, 249, 259, 275, 291, 307, 323, 340.
 Electrically-Driven Machinery, 294.
 Electrically Driven Tea Factory, The, 4.
 E. M. F. of the Arc With Aluminum Electrodes, 410.
 ELECTRICAL PATENT RECORD:—
 Pages 27, 44, 60, 76, 92, 108, 124, 139, 156, 172, 188, 204, 220, 236, 252, 268, 284, 300, 316, 332, 348, 364, 380, 396.
 ELECTRICAL SECURITIES:—
 Pages 13, 29, 45, 61, 77, 93, 109, 125, 141, 157, 173, 189, 205, 221, 237, 253, 269, 285, 301, 317, 333, 349, 365, 381, 397, 413.

F

First French Electric Railway, The, 4.

G

General Electric's Sixth Annual Report, 261.
 Good Books for Electrical Students and Others, 169.

H

Harrisburg Foundry and Machine Works, The, 105.
 Herz's, Dr., Claim for Indemnity, 24.

I

Illinois Street Railway Association, 339.
 Important Electrical Exhibition Arrangements, 56.
 International Competition for the Phebe Hearst Arc Plant, 25.

International Exhibition in Glasgow, 324.
 International Ohm, The, 183.

INCORPORATIONS:—

Pages 12, 27, 43, 60, 75, 91, 107, 123, 139, 155, 171, 188, 204, 220, 235, 251, 268, 284, 299, 316, 332, 348, 364, 380, 396, 411.

J

Joint International Meeting at Laredo, Texas, 121, 169.

K

Kingsland System of Electric Traction, The, 248.

L

Lamp Company in Trouble, 35.
 Lecture on Electric Engineering, 73.

LEGAL NOTES:—

American Range Finder Co., assignment, 186.
 Bates, Charles Austin, vs. General Electric Co., receiver asked for, 89.
 Barden-Sheets Electrical Construction Co., mortgage, 154.
 Bernstein Electric Co., assignment, 57.
 Blackman, A. W. R., embezzlement, 250.
 Blauvelt vs. Interior Conduit & Insulation Co., infringement, 137.
 Bloomington City Railway Co., property sold, 218.
 Breakenridge, George T., assignment, 121.
 Buffalo, Kenmore & Tonawanda Electric Railway Co. vs. John B. Damont, money, 330.
 California Electric Co. vs. California Safe Deposit Co., damage, 202.
 Calumet Electric Railway Co., receiver appointed, 10.
 Campbell Electric Supply Co., receiver, 106.
 Campbell, Frank, damage, 89.
 Cataract General Electric Co., receivership vacated, 121.
 Central Trust Co. vs. J. C. Hubinger, conversion of property, 234.
 Christy, Miss Regina, vs. Northern Electric Light & Power Co., damage, 121.
 City Electric Railway Co. vs. Guarantors' Liability Indemnity Co., damage, 89.
 City of Indianapolis vs. Citizens' Railroad Co., franchise, 234.
 Cole, Wm. R., vs. Detroit Telephone Co., damage, 201.
 Consolidated Car Heating Co. vs. Gold Car Heating Co., infringement, 362.
 Consolidated Car Heating Co. vs. West End Street Railroad, infringement, 137.
 Consolidated Electric Storage Co. vs. Atlantic Trust Co., judgment reversed, 10.
 Davis, Hattie C., vs. Electric Self-Playing Piano Co., damage, 234.
 Detroit Citizens' Street Railway Co., franchise controversy, 330.
 Diehl Mfg. Co. vs. Royce & Marean, infringement, 74.
 Dolgeville Electric Co., receiver appointed, 410.
 Edison Electric Light Co. vs. Minneapolis International Electric Co., infringement, 106, 394.
 Edison Electric Light Co. vs. Doubleday Electric Co., injunction asked for, 154.
 Edison General Electric Co. vs. Western Electric Co., infringement, 105.
 Electrical Railway & Equipment Co. vs. Metropolitan Railway Co. and Capital Traction Co., injunction asked for, 394.
 Farmers' Loan & Trust Co. vs. Salt Lake and Ogden Gas & Electric Light Co. and the Union Light & Power Co., foreclosure suit, 202.
 Fay, James P., vs. Galveston City Railway Co., damage, 169.
 Fisher Electric Mfg. Co., mortgage foreclosure, 121.
 Fort Wayne Electric Co. vs. Franklin Electric Co., money, 10.
 Foulds, Albert, vs. Pennsylvania Insulated Wire Co., receiver asked for, 394.
 General Electric Co. vs. La Grande Edison Electric Co., suit to recover notes, 106.
 General Electric Co., assumption damage, 74.
 Greeley, E. S., & Co., receiver appointed, 105; money, 154.
 Hart & Hegeman Mfg. Co. vs. Anchor Electric Co. et al., injunction asked for, 298.
 Hill, Thomas, and holders of Hudson Telephone Co. stock, receiver asked for, 90.
 Hix, W. Preston, vs. Edison Electric Light Co., damage, 201.
 Holt Electric Storage Co., receiver appointed, 298.
 Hyer vs. Richmond Traction Co., franchise, 25.
 Imperial Electric Co., sold out by sheriff, 234.
 Indiana Traction Co., claims paid, 201.
 Judge, Nellie E., vs. Narragansett Electric Lighting Co., damage, 154.
 Kimball, Willis, vs. West End Street Railway, damage 25

Lake Cities Electric Railroad Co., receiver appointed, 57.
 Lancaster & Susquehanna Turnpike Road Co., Lancaster & Columbia Railway Co., Given, W. B., vs. Columbia Telephone Co., appeal for injunction, 201.
 Leary, J. F., vs. Atlanta Electric Railway Co., mortgage foreclosure, 169.
 Le Roy Gas Light Co., taxes reduced, 201.
 Little, George H., writ of mandamus applied for, 169; writ of mandamus denied, 410.
 Macon Gas Light & Water Co., auction sale of electric light plant, 313.
 Malochee vs. Great Southern Telephone & Telegraph Co., damage, 25.
 Massachusetts Loan & Trust Co. vs. Citizens' Electric Light & Power Co., receiver appointed, 25.
 Melanson, Charles, vs. Thomson-Houston Electric Co., damage, 298.
 McCarthy, Maurice, vs. New York & New Jersey Telephone Co., damage, 282.
 Municipal Electric Light Co., mandatory injunction denied, 282.
 Mutual Electric Light Co., mandate of court asked for, 313.
 National Conduit Co. vs. Talcott H. Russell, patent infringement, 154.
 National Electric Mfg. Co., receiver discharged, 10; receiver ordered to turn over all books and vouchers to court, 151.
 New Jersey Electric Railroad, receiver appointed, 74.
 New York, New Haven & Hartford Railroad Co., appeal for extension not allowed, 57; vs. Fair Haven & Westville Railway Co., damage, 394.
 New York City vs. Metropolitan Street Railway Co., decision of rights as to property, 298.
 New York Security & Trust Co. vs. Saratoga Gas & Electric Co., mortgage foreclosed, 201.
 N. Y. & G. L. R. Co. vs. N. J. E. R. Co., rights as to speed, 313.
 Ohio Storage Battery Co., suit for dissolution and appointment of receiver, 330.
 Old Colony Trust Co. vs. City of Atlanta, ordinance to regulate rates of fares, 316.
 Ongley Electric Co., receiver appointed, 362.
 Ottumwa Electric Railway Co., mortgage foreclosure, 15.
 Ottawa Street Car Co., receiver appointed, 57.
 Owner of Vehicle vs. Street Car Co., damages, 410.
 Packer, Louis M., vs. Thomson-Houston Electric Co., damage, motion for new trial, 10.
 Pelzer, William, vs. Horn & Brannen Mfg. Co., Acme Gas Fixture & Art Metal Co., R. W. Giese & Co., and W. J. Buck's Sons & Co., patent infringement, 370.
 Perkins Electric Switch Mfg. Co. vs. Gibbs Electric Mfg. Co., bill for alleged infringement dismissed, 394.
 Peterson, Senator S. D., vs. Western Union Telegraph Co., suit for libel, 265.
 Pitman Grove, Glassboro & Clayton Electric Light Co., receiver appointed, 105.
 Port Huron Electric Railway Co. vs. Guarantors' Liability & Indemnity Co., damage, 186.
 Praeger, Dr. Louis F., vs. Brooklyn Heights Railroad Co., damage, 298.
 Puritan Electric Co., stock seized, 121.
 Reed, Warren B., and Brainerd R. Rison vs. Edison Electric Light Co., infringement, 279.
 Richmond Railway & Electric Co. vs. Virginia Electric Co., Baltimore, suit for alleged violation of contract, 394.
 Ridall, John E., vs. Brush Electric Co., suit to recover money and goods, 57.
 Roanoke Street Railway and Roanoke Electric Light & Power Co., receiver appointed, 121.
 Rothermel, John H., writ of certiorari granted, 313; contract awarded for lighting Atlantic City, 362.
 Ryan, Leslie W., charge of perjury, 19.
 Sherwood, Robert H., and Ralph C. Swan vs. Maitland F. Graves, money, 89.
 Sprague Electric Railway & Motor Co. vs. Steel Motor Co., Union Railway Co., and Nassau Electric Railroad Co., infringement, 218, 313, 394.
 Staten Island Traction Co., foreclosure sale, 282.
 Supreme Court of Wisconsin, decision entitling property holders to damages against railway companies, 186.
 Tacoma Gas & Electric Light Co. vs. Tacoma City, fraudulent sale, 202, 362.
 Telephone suit, Minneapolis, a novel ruling, 330.
 Teela Electric Co. vs. Davison Fau & Motor Co., injunction asked for, 379.
 Thomson-Houston Electric Co., vs. Astor Orange Railroad Co., Walker Co. and Union Railway Co., Hartford & West Hartford Railroad Co., Minneapolis International Electric Co., infringement, 25, 89, 362, 394.

Thompson, William, vs. Lowell, Lawrence & Haverhill Street Railway Co., damage, 218.
 Todd, Alexander R., vs. Second Avenue Traction Co., damage, 346.
 Virginia Electric Co. vs. Richmond Railway & Electric Co., franchise, 362.
 Warren Electric Co., receiver asked for, 154.
 Western Electric Co. vs. Kellogg Switchboard & Supply Co., appeal for injunction, 362.
 Whitehouse Department Store vs. Edison Electric Co., damage, 121.
 Wilson, Carlos, vs. Thos. W. Bioknell, money, 74.
 Windsor vs. McCaskey-Holcomb Co. et al., injunction asked for, 57.

Vol. XIV.

NEW YORK, JANUARY 12, 1898.

No. 1

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES,	\$2.50
IN CLUBS OF FIVE OR MORE,	2.00
FOREIGN COUNTRIES,	4.50
SINGLE COPIES,	10 cents

ADVERTISING RATES:

As **ELECTRICITY** reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application. Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

EDITORIAL NOTES.

A Prize Offer.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to **ELECTRICITY**.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For Electricity's Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of **ELECTRICITY**, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and wherever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of **ELECTRICITY** duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all theses submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of **ELECTRICITY**, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we should like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not thoroughly clear, we will be pleased to answer any inquiries relating to this matter.

Novel Electric Railways.

If all the reports we hear are true, the coming summer should see the Klondike well equipped with transportation facilities. Several companies have already been organized and others are about to be formed for the purpose of constructing electric railways into that country.

In an editorial which appeared in **ELECTRICITY** some time ago, we suggested as the most suitable form of railway a single rail electric road with the rail some distance above the surface of the ground. A company is now being formed in Seattle, so we understand, and plans have been prepared for an electric road which it proposes to build over the Skaguay trail and which is to be erected after the manner we suggested. The track is to consist of 12 by 12 inch posts six feet high and fourteen feet apart, on top of which will be strung two timbers 6 by 12 inches, and twenty-eight feet long, on which a 30 lb. steel rail is to be placed. The cars it is proposed to use are to be fifteen feet long and four feet wide, having but two heavy wheels, each of the latter being equipped with a 15 H.P. motor. When in operation two cars will be joined together by heavy overhead beams and run one on either side of the rail, making practically one car. The bottom of the cars will be two feet above the surface of the ground, which will enable them, so it is thought, to successfully plough their way through any ordinary snow drift. It is estimated that 1,000 feet of track a day can be built in Alaska at a cost not exceeding \$5,000. Although this would make a road cost \$26,400 per mile, considerably more than the ordinary trolley, when the rugged nature of the country is taken into consideration this amount does not seem excessive. A trolley of the above description would appear to be admirably adapted to the needs of such a country, but it would seem as though it might be further improved upon by placing the rail at a greater elevation. This might increase the first cost slightly, but it would effect a great saving in wear and tear, and would allow of greater speed being made.

Another company composed of American capitalists propose overcoming the difficulties of the Dyea trail in a rather novel manner, by means of an aerial railway. Steel columns thirteen feet in height will be erected one hundred feet apart, from the top of which wire ropes will be suspended which will constitute the track.

Specially designed cars will be hung from this track by means of steel bars, each carrying two grooved wheels running on the cable. A lower cable attached to the vertical bar of the car will be used for propulsion, which will be accomplished by means of a stationary motor. The promoters' idea in building this railway, which will be but seven and one-half miles long, is to afford a speedy and easy method of transportation over an exceedingly rough portion of the route.

The unusual difficulties attending the construction and maintenance of an electric road in that part of Alaska require the adoption of extraordinary methods, and the next few months will therefore probably bring forth a number of unique systems of electrical propulsion.

* * *

Telephone Charges.

The New York *Herald* has recently devoted considerable of its space to discussing the existing telephone rates in this city and comparing them with similar charges made abroad and in other cities in this country. As is well known, in New York a subscriber has his choice between what is known as the flat rate system, which costs \$240 a year and which means unlimited service, and the toll system, which limits him to six hundred conversations a year for which he is supposed to pay \$90. Chicago has telephone rates that vary from \$175 a year for unlimited service to \$58.40 a year for a limited service. In Philadelphia the charges for unlimited service are even lower than in Chicago, and a business house can have an instrument installed and use it as often as required for \$160 a year. This same service in Boston costs \$180.

New York City has all along had the reputation of being the stronghold of the Bell Company, and judging from the charges that subscribers are obliged to pay, this would certainly seem to be the case. Now the question naturally arises, why are the telephone rates in this city so much higher than in other large communities of the United States? The daily previously referred to endeavors to solve this problem, and publishes an interview with Mr. U. N. Bethell, general manager of the New York Telephone Company. To the question as to whether it would not be possible to radically reduce the present rates and still leave a profit, Mr. Bethell is quoted as follows:

"You must take into consideration our very heavy expenses, such as the subway charges. It costs us about \$800 a mile. Then, our rents are much higher than in other cities. Why, we pay \$10,000 for one little office. You don't find such rents even in London or Paris. Again, we have to pay much higher wages than in European cities. In short, nearly all of our expenses are heavier than abroad. The same thing holds with the larger cities of this country."

In the above answer the whole point of the inquiry seems carefully evaded.

It is unquestionably true that foreign rates would naturally be lower than the average rates in this country, principally on account of the labor item, but this argument no longer holds good as regards Boston, Philadelphia and Chicago. The rents in New York are undoubtedly higher than in the latter cities, but assuming similar rates in all these cities, this difference in rent should be more than made up by the difference in the number of subscribers. There is no gainsaying the fact, however, that the expenses of a company such as the New York Telephone Company are heavier in a city like New York than in the other municipalities mentioned, but there can be scarcely any doubt that the present telephone rates could be materially reduced and still leave the company a fair profit. So long as the general public are willing to pay high rates and make no effort to have them reduced, so long will they remain high. The Bell monopoly has always been run by a set of enterprising business men who are not in the habit of allowing chances to make money slip by them.

Regarding the question of high rates the *Herald* says:

"Other directors of the New York Telephone Company refused to discuss the matter. According to the reports of State investigating committees the company is making very large profits, the amount of which, however, is not published."

There is scarcely any doubt but what their profits are large. With 21,000 subscribers in New York,

which this company acknowledge they have—5,000 paying \$240 a year and the other 16,000 who have limited service paying \$90 a year—the total gross revenue would amount to \$2,640,000. This, of course, does not include the amounts taken in each month from the subscribers who have limited service and who frequently call up more times than their rate allows. If the operating expenses of the local company are two-thirds of the total gross receipts, and it is rather difficult to see how they can be much more, there would still be a balance of almost \$1,000,000 left. That certainly looks as if the existing rates could be further reduced and still leave a fair profit.

The Paris edition of the *Herald* recently mentioned a circumstance which is often lost sight of and which is sometimes a source of expense to a corporation. It refers to this matter as follows:

"All the companies in New York are more or less liable to have to pay out money to keep 'square' with the 'powers that be,' and most business men, used to large enterprises of the kind, would consider that it would be disastrous to a company to have the telephone system taken over by the Government so long as the 'spoils' system is so much in vogue. Hence, for an efficient telephone service, private companies are considered in America as more satisfactory."

In Paris the telephone system is controlled by the Government, and although such an arrangement works fairly well there and in Europe generally, and usually ensures low rates, it can scarcely be recommended for this country. The rate in Paris for unlimited service is but \$40 a year, this low charge probably being accounted for by three circumstances which do not exist in New York. First, the cost of labor, as is well known, is much lower in France than in this country; secondly, no expense is incurred for subways, as the cables are placed in the sewers; and thirdly, there is no great desire on the part of the Government to make money, as would be the case were the system operated by an independent company. As we have already stated, however, it is hardly fair to compare the rates in New York with those abroad, but what we can base our comparisons on are the existing rates in other large cities of the United States. In comparing these charges we find that the public in New York are paying 25 per cent. more for telephone service than the people of Boston, who apparently have the next highest rates. This is scarcely just, for although the cost of operation may be slightly higher in this city, there is no such discrepancy as the difference in charges would lead people to believe. When the general public awake to the fact that they are paying exorbitant charges and demand a reduction it will be forthcoming, and no one need be afraid that this would result in a receivership for the telephone company.

* * *

Proposed Trolley for Chicago River.

Mr. A. S. Hibbard, general manager of the Chicago Telephone Company, recently suggested that the Chicago river be navigated by electric lighters. His idea would seem to be to have an outside harbor with almost limitless dockage and use the river exclusively for the trolley boats, the purpose of which would be the lightering of big freighters in the outer harbor and the distribution of cargoes almost at the merchant's door. Mr. Hibbard thinks there is ample room for operating four parallel trolley lines, and that power could be obtained very economically from either the drainage canal at Lockport or from the large electric plants of the city. In the *Milwaukee Sentinel* Mr. Hibbard is quoted as having made the following statement regarding these river trolleys:

"This is no dream, no idle fancy of a visionary, but a plan that will appeal to the practical, common sense of any competent electrical engineer. Chicago has reached a point in her growth where no small

half-way measures should be considered. We must plan in keeping with our present standing and great possibilities. I would summons electricity—that wizard of the century—to help us banish many of our greatest evils. No one will question that our present harbor facilities are wholly inadequate; that swing bridges are an hourly torture to our nerves and patience; that the tunnels are a back number, and that our unsightly river is the butt for a nation's ridicule. The drainage trustees promise to make the river quick running, clear and wholesome. I would cover its surface with busy commerce and by means that would add no taint to the air or discolor the limpid water."

This plan, as suggested, necessitates the use of steam tugs to take these electric lighters from the mouth of the river where the trolley wires terminate to the loaded vessels in the harbor as well as to bring them back. Moreover, with four lines of wire running up the river, the boats using the inside wires might find difficulty in making their docks, as doing so would necessitate their letting go of the overhead trolley. This could be remedied, and it would probably be found necessary to do so by placing storage batteries on each of the lighters which could be charged from the overhead conductor. The adding of storage batteries, although it would increase the cost, would also enable a lighter on reaching the mouth of the river to dispense with the services of a tug.

Undoubtedly the advantages of such a scheme would be its cleanliness, due to the absence of smoke and soot. As regards the financial aspect, it is questionable whether this arrangement would be any more economical than either gasoline or naphtha. Were electricity used, three separate units would be required, whereas but one would be necessary were either of the other two motive powers adopted.

Whenever the water of the Chicago river flows toward the Mississippi, as it presumably will when the drainage canal is completed, it would be far preferable to use the river as Mr. Hibbard suggests rather than to cover it with iron planking and asphalt with a view to making a huge culvert of it as Mr. Yerkes has suggested.

Under the Searchlight.

Notes and Comments on Various Topics.

A Westinghouse Kick.

(From the Boston Herald.)

The following account of the rumored difference between the General Electric and Westinghouse companies is given in New York: According to the terms of the agreement, the General Electric Company was to receive 65 per cent. and the Westinghouse 35 per cent. of the business. Should either company do a greater percentage than the amount stipulated, it agreed to pay over to the other a certain percentage of the revenue derived therefrom. The General Electric Company ran ahead of its proportion. Westinghouse brought the matter to the attention of the directors of the two companies, a number of conferences were held, and an agreement was reached satisfactory to both parties and relations are harmonious.

It must have been astounding as well as irritating to Mr. Westinghouse to be obliged to hold several conferences in order to decide a matter that was plainly set forth in the bond between the companies, and he will hardly be able to promptly rid his mind of the fact that the attempt was made to overreach him. But he should have known that he is unable to cope with Charles A. Coffin in such affairs. He will find that future conferences for the settlement of questions between the two companies will be more and more prolonged and less and less satisfactory until the end is reached. What the end will be we will not venture to predict, but there is a fable about the wolf and the lamb that suggests the probability.

* * *

ACCORDING to the public press the temperance circles of Chicago have been of late terribly stirred up, not to say overwhelmed, by the discovery that

the electric light plant of the building they occupy actually furnishes light to a saloon. We fail to see why the temperance society should object to "letting their light so shine before men."

* * *

The Manhattan Elevated Contract Will Be But a Drop in the Bucket for the General Electric Company.

Regarding the recent decision to equip the elevated system with electricity, Manager W. J. Fransioli made the statement that a fair estimate of the total average power needed to operate the elevated railroad system was about 75,000 horse-power. With a view to showing how absurd it is for the General Electric Company to rely on this contract to help them to a dividend-earning basis (provided of course that that organization gets the whole contract, without the Westinghouse Company coming in for its share), we have made the following calculation. Assuming that the 75,000 HP. costs \$10 per HP. for electrical generators and appliances and \$10 per HP. for motors, etc., the total contract for this electrical apparatus would amount to \$1,500,000.

The amount of business required by the General Electric Company to pay dividends on its present capitalization is about \$45,000,000 per annum. Its present business amounts to about \$12,000,000 per annum. There is therefore a deficit in business at present to earn dividends of \$33,000,000 per annum. As the Manhattan contract amounts only to \$1,500,000, it would be necessary for the General Electric Company to get nearly two such contracts a month to earn dividends on its present capitalization. And yet it is trying to cheer up its drooping stockholders with vague intimations of millions of profit.

* * *

CHICAGO is said to have started what is known as the trolley church collection boxes. A wire is stretched from pew to pew upon which little carriages are strung. This contrivance is operated by electricity, and the minister by merely touching a button located in front of him on the top of the pulpit releases these little cars simultaneously all over the church. The great advantage claimed for the trolley collection boxes is that it keeps the amount of each contribution a secret from those sitting in the vicinity. We hardly think this will prove an advantage in fashionable churches, for without the possibility of one's neighbor seeing the amount of a donation, the total collection would probably be considerably smaller than usual.

* * *

It now seems that Emperor William of Germany, not content with having tried his hand at painting, poetry, oratory and numerous other things, is about to enter the field of electrical science. The *London Electrical Review* says: "He will lay aside for the time being his brush and palette, will hold the Muses in abeyance, will stifle his Rozinante, forget the sound of martial music, and in a serious manner sit down to devise an electric tramway system such as no man ever invented before him. We learn that it has been left to him to decide what system of electric traction shall be adopted for Berlin; but it is highly probable, we are told, that he will not select either of the systems already propounded, but will, if he has time, invent a new one. The principal difficulty seems to be the want of time; but if we may, without being guilty of treason, suggest anything, we should think that a whole army of poets, artists, prophets and admirals might be found ready to bow the knee and relieve him of his other duties for the time being, so that his entire genius could be concentrated upon a matter which has to a certain extent baffled electrical engineers of life-long experience of all nations and tongues up to the present time. A capital idea would be for the Emperor to purchase for a few marks some patent or other from one of his starving subjects, and whether he understands it or not, to give it his approval. Then, whether it is good or bad, who in Germany will dare to criticize

it? It must be favorably received by the press and the public or the results—! We are tempted to wonder whether the Emperor's system will be a trolley or conduit; or it may be, he will bring out a new accumulator—or, perhaps, even a primary battery!"

* * *

CHAS. G. ARMSTRONG refers to electrical journalism in the *Chicago Record* as follows: "I think all engaged in electrical work will agree with me that the most potent factor in the development of this limitless agent has been the high character, the untiring energy, exhibited by our various electrical journals. One who has watched their struggles, ever endeavoring to eliminate the chicanery, to expose any attempt of unscrupulous inventors to rob the over-confident public, holding up the hands of the faithful and honest worker however humble he might be, ever ready to enlighten the public of the to them marvelous and unreal force, avoiding the spectacular and theatrical, cautioning the too ready investor, ever encouraging the legitimate enterprise—thus have the electrical journals done as much as the inventors themselves to perfect, to ripen, as it were, into usefulness this vast industry. I have often wondered what the electrical fraternity would have done had it not been for the untiring enterprise of the electrical journals. Text books have often been valueless. The science has grown so rapidly that before a text book could be written and placed on the market the subject would be trite and the theories outgrown. The machines described therein would no longer have been used, new ones having been devised and placed in their stead. But meantime our faithful journals, week by week and month by month, have kept pace with the rapid trend of affairs." Mr. Charles G. Armstrong must certainly have had ELECTRICITY specifically in mind when he wrote the above; for we are unquestionably the only electrical journal that can conscientiously assert that it has always endeavored to guard the interest of the investor and protect the trade by showing up unscrupulous undertakings. We have always fought to place the electrical industry on a good, honest basis, and we will continue doing so until our efforts are crowned with success.

A New Postage Stamp Commemorative of the Holding of the Trans-Mississippi Exposition.

For the third time in the history of the nation, in recognition of the importance of a brilliant enterprise, Postmaster General Gary has decided to order a series of special postage stamps commemorative of the holding of the Trans-Mississippi and International Exposition at Omaha in 1898. The stamps will be issued in denominations of 1-cent, 2-cent, 5-cent, 10-cent and \$1, making it possible for the public to use these stamps on all outgoing foreign as well as domestic mail matter and packets of merchandise. In the United States there are 70,000 post-offices, so that the widespread circulation of these special stamps, suggestive of the Trans-Mississippi and International Exposition, will be readily attained. The issue lends the Exposition the prestige of Government recognition and support.

In issuing these special stamps it is not designed by the Postmaster General to withdraw from sale the current series as was the case during the World's Fair. The series of special stamps for the Trans-Mississippi and International Exposition will be supplied to any office in the United States, and every postmaster will find an active demand for them from the start, not only by stamp collectors, but by hundreds of thousands of people who will prefer them during the Exposition period in place of the regular series.

Third Assistant Postmaster General Merritt invites suggestions of scenes for use on the stamps, it being the desire of the Post-Office authorities to give the Trans-Mississippi and International Exposition the handsomest set of stamps ever issued to commemorate an Exposition.

CHEAP TELEPHONE LINES.

The following article, which appears in the *New South Wales Railway Budget*, is interesting as showing how poor the insulation of a telephone line must be before the instruments are useless. It must be remembered, however, that the climate is the ruling factor in such lines as described below, and that what may be possible in Australia may be wholly impracticable here.

The Railway Commissioners have a great penchant for adopting inventions where there is economy to be gained, and an interesting instance of the adoption of modern ideas in a minor way has recently taken place in connection with telephone communication.

At the present time, the common idea of the telephone is that of the ordinary telegraph poles, with wires stretching overhead; but the commissioners have recently experimented with telephones, with wires in the first place between the rails, and in the other along the railway fences.

The first of the two instances referred to is the practically poleless line which has been laid from Nyngan Junction to Hermidale, on the Cobar branch, a distance of 28 miles.

Starting from Nyngan, there is about a mile of telephone line to Nyngan Junction, whence the circuit is continued by means of a No. 6 iron fencing wire in the center of the track. This wire rests at intervals in a groove across the top of a hardwood block measuring 4 in. long by 2 in. high by 1½ in. wide; a cap of the same wood holds the wire down, and two 4 in. iron wire nails through cap and block into the sleeper secure the whole so firmly that it needs the deliberate use of very heavy tools to loosen it. The blocks, which were designed with a view to cheap production, were made in the interlocking workshops, and were dipped in a preparation of Stockholm tar, resin, etc., to increase their durability and insulating properties. The maximum distance between any two blocks is about 100 ft., but the spacing was often regulated by the curvature of the line and the weight of the ballast. In fact, contact with the ballast was in some instances unavoidable; and although the clean broken porphyry will constitute an excellent insulator in all but the worst of wet weather, it has been considered advisable to arrange for the ballast to be lowered in these places as opportunity offers. The wire was erected as high as was deemed wise in consideration of the line being unfenced and the presence of cattle on the route. At crossings of roads or beaten tracks the wire is brought up to a pole on each side and connected by an overhead hard-drawn copper wire at the regulation height.

The telephone at Hermidale makes earth by means of two copper plates placed vertically in the ground, and presenting a total of 48 square feet of contact surface, while that of Nyngan utilizes the water-supply pipes. Having made every provision to secure a low circuit resistance, the comparatively poor insulation resistance is further taken into account by specially winding the coils of the generators for a heavier current than usual, so that considerable current may be lost along the line and yet sufficient remain to ring the distant bell. Up to the present the line has given entire satisfaction. Observations will be taken of its behavior under all variations of temperature and weather, and if the results warrant the expectation of sufficient reliability under local conditions for railway purposes, it is the intention of the commissioners to extend the line on to Cobar in a similar manner.

Of equal interest is the recent use by the commissioners of the wire of the fence for telephonic purposes between Walla Walla and Corowa. This is a means of communication that may, however, be largely taken advantage of in the future for railway and other purposes. One naturally begins to wonder whether the rails themselves might not under certain circumstances be utilized by means of a suitable telephone, and whether indeed, what with return currents on the rails of the fast-increasing electric

railways and tramways, the use of gas and water mains for telegraphic and telephonic requirements, we are not rapidly approaching the time when it will be impossible to lay down a hundred yards of metal for any object whatever that will not be com- placently appropriated by electrical engineers for the purpose of conveying current. In fact, they are already treading on one another's toes, and it has taken some very weighty legal proceedings to decide which had the better right to the use of that for which neither had paid.—*Electrical Engineer, London.*

Electric Tramways in Cork.

The electric tramways of the city of Cork consist of about 11 miles of track. The gauge is 3 ft., which is the same as that of other lines running out of the city. The rails weigh about 83 lbs. per yard. The power station buildings about to be equipped for electrically working the line will comprise an engine room, boiler room, battery room, car-shed and repair shop, covering an area of about 12,000 sq. ft. In the boiler room there will be three Babcock & Wilcox boilers, each of 2,531 sq. ft. heating surface, and capable of evaporating 8,000 lbs. of water per hour. There will also be an auxiliary heater, combined hot-well and filter tank, and a duplicate set of filters. The chimney stack will be of steel, 7 ft. internal diameter, and 130 ft. high. The engine room will contain three McIntosh and Seymour side-crank tandem compound engines directly connected to 200 kilowatt generators, running at 150 revolutions. The engines will be run condensing, two Wheeler, Admiralty type, standard surface condensers, each having a capacity of 12,000 lbs. steam per hour, being erected on the engine room floor. Condensing water will be taken from the river, about 500 ft. distant. The battery room will contain 256 Tudor cells capable of discharging at 110 amperes for seven hours. A booster of suitable capacity will also be supplied for regulating charge of cell, the booster being in the engine room. The switchboard will consist of a combination of lighting and railway panels, the same machine being interchangeable for railway and lighting service. The lighting distribution using 220-volt lamps will be on the three-wire system, at 440 volts across the outers. The battery and regulators will be connected in the neutral, so as to control the balancing current. The dayload will be taken from the railway generators by a motor generator consisting of a motor and two 220-volt generators on the same bed-plate. The generators also act as regulators when a single 440-volt generator is supplying the lighting current direct. There will be 18 double-decked cars, seating 44 passengers, mounted upon single Peckham trucks with double motor equipments and series-parallel controllers. The line construction will consist of iron poles with brackets, side brackets being used for single track, and double brackets with center poles for double track. There will be 94 arc lamps mounted on the top of the poles, constant potential arc lamps being used, connected to the underground network of lighting mains.

An Electrically-Driven Tea Factory.

The *Indian and Eastern Engineer* states that the British Darjeeling Tea Company is the first tea factory to introduce electric power for driving their plant. The Thurbo tea estate, which is owned by the company, covers over 3,000 acres, extending from the Mechi river (one of the Nepal boundaries) to the Rungbong river. The factory is situated at one mile from the latter river, at an elevation of 4,000 ft. The water, taken from the Rungbong river, is led by a substantial waterway of masonry to a point where a fall of 56 ft. is obtained; from this point 16 in. steel pipes convey the water to a 40 H.P. Jonval turbine. To this turbine is connected, by belt and pulley, a Mather and Platt "Manchester" dynamo capable of generating 70 amperes at 320 volts. The current is transmitted by overhead copper wires to the factory, where it drives a Manchester motor

capable of developing 24 B.H.P. The machinery driven comprises two tea driers, two tea-leaf rollers, one tea packer, two tea sifters, and one tea cutter. The electric lighting is effected from the same mains. Our Indian contemporary points out that owing to the stringency of the Forest Department, firewood is difficult to obtain in the Darjeeling district, and coal has to be brought from afar and is dear.

A Novel Electric Boat Propeller.

We had an opportunity lately, says a London journal, of seeing a new development in the design of electrically-propelled pleasure craft, which has been given the name of the "Nymph." Briefly, the "Nymph" is an attachment to an ordinary pleasure boat sailing ahead of it but rigidly connected to it, the boat containing the accumulator cells and the switch-gear by which is controlled the motor in the body of the swan-shaped tug. The craft is guided or steered by two reins attached to the head of the "swan," and these reins actuate by gear the ordinary rudder. A regulator situated close to the right hand of the driver enables him to control the speed of the motor and propeller in the "swan," and to go at full or half speed, ahead or astern. There are 16 chloride cells of 17 plates each, and these, for starting and low speeds, are connected to the motor in two parallels of 8 cells each, all the cells being used in series for full speed. The total electrical capacity of the battery is about 300 ampere hours, and this is equal to propelling the boat at a speed of eight miles an hour for six hours, or a total distance of about 50 miles, with six people on board. No resistances are used, and neither the field nor the armature is divided up in any way to regulate the speed. The vibration of the boat is perceptibly less than in one containing the motor. Although the arrangement lends itself to graceful design, there is probably considerable loss of efficiency as compared with the usual stern propeller. The inventor of the "Nymph" is Mr. Bowick.

The Transformation of X-Rays by Metals.

An article by M. G. Sagnac, with the above title, appears in the *Comptes Rendus* of December 6. When Roentgen rays strike a metal plate, even when this is formed by a mercury bath and the angles of incidence is 75 degrees, they are diffused without experiencing any appreciable regular reflection. M. Sagnac has been investigating the characteristic of these secondary rays, and has arrived at the following conclusions: The secondary rays are propagated in a straight line, and do not experience any sensible diffraction or refraction. They are not reflected either, and if they themselves impinge on another mirror they are diffused in the same way as X-rays; in discharging electrified bodies they also act similarly to X-rays. The secondary rays from different metals can be distinguished by their different transmission through the same substance.

Thus, for instance, the rays from copper are transmitted by black paper to a greater extent than the rays from zinc and tin. Rays from lead are absorbed more by the atmosphere than rays from zinc and copper. It is also noteworthy that various bodies are more opaque to the secondary rays than to the incident rays which generate them. Thus if a sheet of aluminum 0.2 mm. thick be placed between the Crookes tube and the radiating metal sheet, the photographic or discharging action of the secondary rays is reduced but slightly—say, by one-third. If, on the other hand, the aluminum sheet be placed between the secondary rays and the photographic plate or electroscope, their action is considerably diminished.

Finally, M. Sagnac is of opinion that the secondary rays which metals emit under the influence of X-rays are new rays neighboring on X-rays, and that they must doubtless be placed in a similar position to the rays issuing from a Crookes tube as that taken by the radiation of a luminescent body with regard to the rays of shorter wave-length which have produced it.

A Telephone Transformer.

The researches recently made by Dr. Reding with regard to the efficiency of transformers included tests of a telephone translator, or transformer, designed and used by the Warburg Government Telegraph Department. This instrument has lately been considerably altered. It consists of a number of sheet iron stampings 1.2 mm. thick. These are held together by insulated bolts having nuts at each end for clamping the plates together. The upper and open side of the magnetic circuit is closed by a strong iron plate held on by bolts passing into the base of the instrument. The two coils now used are each wound with 1,600 turns of .25 cm. diameter copper wire, having about 200 ohms resistance. In the first apparatus only about 1,200 turns of a heavier wire having a total resistance of 100 ohms were employed.

The present type is said to have the advantage over the old circular type that the coils are easily replaceable in case of damage by lightning, as the iron plate at the top only has to be removed to give access to the windings. There are about 40 of these transformers now in use, and three years' experience has proved that they are reliable and most useful. In the former instruments the iron plates were insulated from each other by paper, but now the oxidized surface of the plates on a coating of shellac varnish is found to be sufficient. The above description is taken from the *Elektrotechnische Zeitschrift*. The most noticeable feature in the transformer seems to us to be that an unlaminated iron plate is used to close the magnetic circuit. From the nature of the vibration in a telephonic circuit we believe that this plate is absolutely useless and perhaps harmful. It would be better to leave the magnetic circuit open, and to hold the coils in place by a wood top.—*Electrical Engineer, London.*

The First French Electric Railway.

The *Revue de l'Electricite* states that the construction of the first electric railway in France is to be commenced immediately by the Paris, Lyons & Mediterranean Company. The line will connect Fayet and Chamounix. The carriages will be automotor, and the current will be taken from a lateral rail by means of metallic brushes. The same system has been adopted on the Saleve railway. The motive force will be derived from two stations which elevate the waters of the Arve to a height of 240 feet. The line will have a length of over 11 miles, and will cross the River Arve five times.

Necessity is the Mother of Invention.

The *Electrical Engineer* of London says: We have heard of electrical engineers taking upon themselves the responsibilities of volunteer soldiers, and now we hear of soldiers taking upon themselves, although only in a minor degree, some of the responsibilities of electrical engineers. A corps of 300 men under the British South Africa Company has, we are informed, during the past few months introduced and erected over 200 miles of telephone wires in Matabeleland, in addition to their regular police duties of garrisoning and patrolling the country.

Waking Up.

In Hang-Chow-Foo, the capital of Che-Kiang, and in Han-Kow, on the Upper Yangtse, Chinese syndicates have been formed to erect electric lighting works. Even in Chang Sha, the capital of the Province Hunan, which is noted for its bitter feeling against foreigners, electricity works have already been put in operation for the lighting of private houses.

The Gas Commission of New York City went out of existence on the first day of the present month. Under the provisions of the new charter its work devolves upon the Commissioner of the Department of Public Buildings, Lighting and Supplies, as do the duties of the Board of Electrical Control.

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES OF EUROPE.

BY JOHN B. C. KERSHAW, F. I. C. (LONDON).

Chapter XII.—Electro-Galvanizing and the Electrolytic Extraction of Zinc from its Ores.

Introduction.—Electrolysis has been applied to the separation of zinc from solutions of its soluble salts for two distinct purposes. In the one case the aim of the inventor has been to extract the zinc from its ore, and the physical characteristics of the deposit of zinc have been of secondary importance. In the other case, the protective coating of surfaces of iron or other metal with a thin, smooth and unbroken layer of metallic zinc has been the object in view, and the character of the deposit has thus been of chief importance in the process. There are several electrolytic processes now being worked upon an industrial scale of operations with considerable success in England and Germany for coating articles of iron with a protective layer of zinc, and this industry may be regarded as an established one. With regard to the electrolytic extraction of zinc from its ores, the position is less satisfactory, and although several processes are now working upon a large scale in England, in Germany and in New South Wales, it is still doubtful whether the zinc obtained in this way can compete with the zinc obtained from other ores by the older and simpler distillation process.

Electro-Galvanizing.—Three electro-galvanizing processes, patented by Cowper-Coles, Alexander, and Richter, are being worked in Europe to-day. These resemble one another in general principles, and only differ in subordinate details of the process of the plant. A solution of a soluble salt of zinc is electrolyzed, using the article which requires the protective coating of zinc as cathode. This of course receives the deposit of metal, and if all the necessary conditions have been observed, a smooth, bright, continuous coating of metallic zinc will be obtained. One of the chief difficulties in obtaining a satisfactory deposit of zinc has been caused by the tendency of the metal to separate in spongy form at the cathode. Many investigators have worked at this problem and have recommended various procedures for preventing the formation of the zinc sponge. Although Siemens & Halske have attributed this form of zinc to the production of a zinc hydride at the cathode, and have therefore recommended the use of oxidizing agents, the greater weight of opinion is on the side of those who consider it is due to the presence of zinc oxide, and who advise the use of reducing agents at the cathode, or of moderately acid solutions.* Cowper-Coles has shown however that if the acidity of the solution exceeds a certain degree spongy zinc is also formed,† and it is thus necessary to pay careful attention to the acidity of the bath in order to obtain satisfactory results. The Cowper-Coles process, according to the patent specification, consists in the use of an electrolyte containing 40 oz. zinc sulphate and 5 oz. ferrous sulphate per gallon of water with anodes of lead. An EMF. of between 3 and 5 volts at the terminals of the electrodes is used, and a current density of about 15 amperes per square foot of cathode surface area. The electrolyte is renewed by use of zinc dust in a vessel outside the depositing cell. Further details of this process will be found in the article already alluded to. Messrs. Mawdsley Sons & Field, London, Messrs. Watson, Laidlaw & Co., Glasgow, Messrs. Tate & Sons of London, and Messrs. Laird Bros. of Birkenhead are using this process for galvanizing various parts of machinery, ships' hulls and sugar-boiling apparatus.

The Alexander process is used by the firm of Seelhorst & Weiner at Rothenfelde in Germany. It differs somewhat from the others in the nature of the coating, which is not one of pure zinc, but consists of an alloy of zinc with aluminum or magnesium. A

few details concerning this process and many facts concerning the subject of electro-galvanizing generally will be found in a paper read by O. Vogel in 1895 before one of the German industrial societies.* Richter's process is worked at Witkowitz in Bohemia and differs little from that of Cowper-Coles. A detailed description of it is contained in a pamphlet published by Richter in Leipzig in 1895 and entitled "Die Galvanische Verzinkung des Eisens." A summarized version of the facts contained in this pamphlet is given in an article in "Stahl u. Eisen," to which readers desiring to know more of this process are referred.†

In all these processes great attention and care is required in preparing the articles for the electrolytic bath. A preliminary boiling in a caustic alkali solution, followed by a lengthy pickling treatment in a weak vitriol solution, is in every case requisite, and Seelhorst in the discussion which followed the reading of Vogel's paper on electro-galvanizing (l.c.) recommended the use of the sand-blast. After the object has been thoroughly cleansed from grease and rust, it should be placed in water freed from air by boiling or in water containing a little ammonia as advised by Richter, until the bath is ready to receive it; and it should on no account be touched with the hands after it has arrived at this stage of its preparation. The adaptation of the form of the anode to that of the object to be coated is another point requiring attention, since it is only when the distances between all parts of the anode and cathode are approximately equal that an even coating will be obtained. As regards the costs of this process the statements are conflicting, and it would appear to be probable that for large objects the electrolytic galvanizing process is more expensive than the older dipping method. But for small articles the difference in cost is much less, and the electrolytic process has the advantage in the command obtained over the thickness of the coating, which can be made either slight or great at will. When the necessary conditions for the production of a good coating of metallic zinc have been complied with, the adherence between the zinc and iron or other metal is all that could be desired. Some details of tests made with electro-galvanized tubes will be found in the article by Cowper-Coles already named.

Electrolytic Extraction of Zinc from its Ores.—There are four processes now at work on a fairly large scale of operations, having for their object the extraction of zinc from its ores. The general principles of these are the same in every case. The ore is roasted, crushed, and leached with acid or salt solutions which dissolve out the zinc and leave the other metals behind. This solution is then electrolyzed, the zinc is deposited at the cathode, and the exhausted effluent is returned to the leaching vats in order to be renewed by passing through a fresh charge of the prepared ore.

The Ashcroft Process is the process which has received trial upon the largest scale. This process is protected by British patents No. 13,850 of 1894, and Nos. 13,534, 14,783 of 1895, and was designed for treatment of the refractory lead zinc ores of the famous Broken Hill Mine, New South Wales. This ore contains 30 per cent. each of lead and zinc as sulphides, with 25 to 30 oz. silver per ton; the sulphides are so intimately mixed that their separation by concentrating machinery is impossible.

The ore is ground and roasted, and is then leached in suitable vats with a solution containing per. salts of iron and salts of zinc. The iron is precipitated as ferrous hydrate by the action of the zinc oxide of the ore, while the latter passes into solution as sulphate or chloride. The iron remains partly in the leaching vats with the lead and silver and partly separates on heating the effluent. The residue is smelted for the two latter metals in the usual manner. The solution from the leaching vats, which must be quite free from iron, is then passed through two sets of cathode

chambers, and one-third of its contents of zinc is obtained as metal deposit on the cathodes. It is now passed through the two sets of anode chambers of the same depositing vats, in the first of which iron anodes and in the second of which carbon anodes are employed. Solution of the anode with formation of ferrous sulphate occurs in the former series, and oxidation of this to the ferric state in the latter. The effluent from the double series of vats is then ready for use again in the leaching vats. This process was operated upon a fairly large scale of operations at Grays in Essex in 1895, and it then passed into the hands of the "The Sulphide Corporation" which, with a nominal capital of \$5,280,000, has purchased mining rights on the Broken Hill estate in New South Wales, and has erected concentrating machinery at the Mines, and an extraction plant based upon the Ashcroft procedure at Newcastle in the same country.

The erection of the large electrolytic plant at the latter place was commenced in March, 1896, and in March, 1897, a portion of it was put into operation. In a run of 4 months' duration 150 tons electrolytic zinc were produced, but unfortunately the economical results have been less favorable than was anticipated, and the directors have decided that if a second run now in progress does not yield more favorable results the electrolytic works must be shut down. The weak features of the process are the necessity for the removal of the whole of the iron from the solution before the zinc can be successfully deposited from it in the cathode chambers of the electrolytic vats, and the necessity for the use of diaphragms between the anode and cathode compartments. The former will give occasion for troublesome filtering operations, the latter, made of close texture canvas, are certain to require frequent renewal. No details of the costs of operating this process have appeared in print.

The Siemens & Halske Process.—This is an improvement of a process patented in the names of Maroh & Storer. The apparatus for working it is described in patent No. 13,434 of 1895. The process was experimentally worked out in Berlin, where the writer believes the production of zinc is still carried on in a small electrolytic and leaching plant erected for trial of the process. A solution of zinc sulphate is used as electrolyte. This is deprived of its zinc in vats divided into anode and cathode compartments by imperfect wooden partitions which serve in place of diaphragms. Lead is used as anode material. Circulation is maintained by means of an injector air jet as described in Chap. IX, on "Copper."** When the amount of free acid present in the electrolyte exceeds 10 grms. per liter, the solution is withdrawn and is used for leaching the crushed and roasted ore contained in specially designed leaching vats. This process is said to work well, and it has passed into the hands of a large company, "The Smelting Company of Australia," which, with a nominal capital of \$2,400,000 has bought mining property and erected works at Illawarra, New South Wales. No details of the costs of operating this process have been published by the inventors, but as Messrs. Siemens & Halske offered to extract the zinc from zinc sulphate solutions for the "Broken Hill Company" at a cost of \$22.08 per ton of zinc recovered, \$4.80 of which represented royalty on the process, it would appear that the actual working costs of the electrolytic part of the process are below \$17 per ton zinc. No particulars of the operations at Illawarra have yet come under the writer's notice; but, as in the case of the Ashcroft process, the final judgment concerning the commercial success of the process when operated on a large scale cannot be much longer delayed.

The Diiffenbach Process.—This process after many experimental trials has now entered upon its industrial stage of development at Duisburg in Germany, where 600 HP. is now utilized in producing zinc by electrolysis of a zinc chloride solution. The

* "Electro-Metallurgie," Borchers, p. 282.

† Stahl u. Eisen, 1895, p. 906.

* Electricity, Nov. 17, 1897.

ore used is a zinciferous iron pyrites from the Siegen mines in Westphalia, and contains 8 per cent zinc before roasting and 15 per cent. after. The presence of this large amount of zinc prevents use of the ore for either sulphuric acid making or for iron smelting. The ore is crushed and is subjected to a roasting with common salt whereby the zinc sulphate is converted into a chloride. The ore is then leached, and the solution containing the soluble salts of zinc and soda is submitted to electrolysis. The residue in the leaching vats when the operations have been successfully conducted contains only .5 per cent. zinc, and is fitted for use by the iron works. The information at one's disposal concerning this process is not very definite, and it is not clear whether the methods of work and the vat arrangement, described in the British patent No. 25,804 of 1896, are being used at Duisburg. The production of zinc by this process is however apparently commercially successful, for after turning out 90 tons zinc per month over a considerable period, extensions of the plant are now being undertaken.

The Cowper-Coles Process.—A small syndicate, "The Cowper-Coles Zinc Extraction Syndicate," was formed in 1896 with a capital of £3,000 in order to give this process an experimental industrial trial at Hayle in Cornwall. No details of the process, the costs of operating it, or of the results obtained at Hayle have yet appeared in print, and one is therefore unable to express any opinion upon it.

In addition to the above four processes, experimental plants for the extraction of zinc from its ores are stated by Borchers to be working at Fuhrfurt a. d. Lahn, at Wiedenau, and at Nornberg, in Germany, and still another process is said to have been started in Duisburg at the works of Matthes & Weber. No details of these processes or of the results obtained are yet forthcoming.

Conclusion.—The theoretical amount of energy necessary to separate one ton of zinc from solutions of the sulphate can easily be calculated by aid of the electro-chemical equivalent of zinc.

736 ampere hours separate .897 kg. zinc.

The decomposition value of zinc sulphate as determined by Le Blanc is 2.35 volts. Basing the calculations upon these figures we find that to separate

one ton of zinc (1,000 kgs.) $\frac{1,000 \times 2.35}{.897}$ EHP. hours

are required. Taking the actual energy efficiency of any zinc depositing process at 33 per cent. * and the cost of the EHP. hour at \$.002, the cost of the electrical energy practically necessary to separate one ton zinc from a solution of the sulphate works out to

$$\frac{1,000 \times 2.35 \times 100 \times .002}{.897 \times 33} = \$15.88.$$

When the costs of operating the process and the depreciation and interest charges upon the capital outlay of the installation are added, it is apparent that Messrs. Siemens & Halske's estimate of \$22.08 per ton leaves little margin for profit.

In bringing this brief review of the electrolytic zinc extraction processes to a close, it must be noted that there is no great demand for pure zinc (the zinc obtained at Duisburg contains .02 to .05 per cent. impurities), and that consequently electrolytic zinc cannot depend upon a market similar to that which exists in the copper industry. The present difference in price between pure zinc and ordinary spelter will, therefore, not be maintained when the former is produced in large quantity; and electrolytic zinc producers cannot count upon obtaining a price much higher than that asked for spelter. With the latter at \$87.60 per ton, it is evident that the outlook for the electrolytic zinc extraction industry is not very promising, and it is only when working upon ores which cannot be successfully dealt with in any other way that these processes have the slightest chance of commercial success.

* This is the average energy efficiency obtained in the electrolytic copper refining industry.

CLONTARF ELECTRIC TRAMWAY.*

The Clontarf section of the Dublin United Tramways Co.'s lines has recently been electrically equipped over a length extending from the city boundary, at Annesley bridge, to Dollymount. The track throughout takes the line of the sea coast at the opposite side of Dublin Bay to that on which runs the electric line of the same company from Dublin to Dalkey. At the Dollymount end of the line are situated the famous golf links of the Royal Dublin Golf Club, which are largely patronized all the year round. The total length of the newly equipped line is slightly under three miles of double track, the gauge being 5 ft. 3 in. (which is the Irish standard gauge), the system of equipment being that of the overhead span-wire trolley.

The power house, which is situated at the Dollymount end of the line, is erected on a site previously used by the Tramways Company for stables and car houses, the buildings then existing being altered to suit the present requirements. It has been erected on the plans of the British Thomson-Houston Company, the building works being carried out by Mr. R. O'Connor, of Dublin, under the direction of the Dublin Tramways Company's engineer. The power house, including the car and repair shops, covers a space of 166 ft. by 140 ft. It is divided up into boiler house, engine house, repair shop, offices and car house, the latter being capable of accommodating 26 motor cars. In the boiler house are installed three boilers of the Babcock & Wilcox type built in one and a-half batteries. The main flue, which runs along the front of the boilers, is lined throughout with firebrick, and the gases can either pass directly through to the chimney or through a bypass via the economizer to the chimney. The chimney is built octagonally, the inside diameter being 7 ft. and the height to the top from the ground line 112 ft. There is a firebrick lining from the floor level of the main flue to a height of about 50 ft. Each boiler has a total heating surface of 2,197 sq. ft. and a grate area of 41 sq. ft. There are two drums to each boiler, which are cross connected. An economizer consisting of 160 tubes has also been erected in the boiler house. Water is supplied to the boilers by two direct acting horizontal Worthington steam pumps, each being capable of delivering to the boilers 22,000 gallons of water per hour against 150 lb. pressure, which is the working pressure of the boilers. A cast iron water tank with a capacity of 10,000 gallons has been erected in the boiler house, but in view of the possibility of the supply of town water not being sufficiently constant, a storage tank with a capacity of 38,000 gallons has been excavated on land immediately adjoining the engine house.

The feed-water piping is in duplicate throughout; it is of cast iron and so arranged that the supply can be taken from either of the water tanks direct to the boilers, or through the economizer. The steam main, also in duplicate, is of lap welded steel pipes with cast steel flanges; branches are taken to the boilers and engines. Either steam range may be worked independently of the other.

The engines, three in number, were built by Messrs. McIntosh & Seymour, and are of the horizontal tandem compound type directly coupled to six-pole 150 kilowatt 500 volt British Thomson-Houston Company's generators running at 200 revolutions per minute. The length of stroke of the engine is 17 in., the diameter of the high-pressure cylinder being 11½ in. and that of the low-pressure 23 in. Both cylinders are provided with valves of the piston type, these valves being provided with an adjustable seat for preventing leakage. The seat consists of two rings made in one piece and connected by several bridges across the port openings which the space between them forms. All the bearings on the engines are lined with Babbitt metal,

* From *The Electrician*, London.

hammered in and bored out. On each engine is fitted a steam separator, this being placed immediately over the main stop valve.

The generator armatures, which are drum wound, have special ventilating ducts and highly laminated cores. The laminæ are dovetailed into the spider supported from the shaft, and are insulated from each other by means of jappanning. The armature windings consist of interchangeable copper bars set into slots in the periphery of the core, insulated all over with layers of paper and mica. The end connections of the armature windings are in one piece with the body of the winding and lie upon the circumference of the same cylinder. The inner surfaces of the end connections are protected by a metal flange from the spider extending laterally to support these end connections. The commutator is of hard-drawn copper insulated with mica. The field frame and magnet cores are of steel, the latter being removable without disturbing the field frame or armature. The coils are wound on separate bobbins so that they can be readily slipped on and off. The brushholders are supported radially, and are constructed with end play to admit of uniform wear of the commutator.

These generators are designed so as to deliver an overload of 25 per cent. above their rating for two hours without overheating. They are also capable of sustaining sudden brief fluctuations up to 50 per cent. above their rating and down to zero without injurious sparking at the commutator, and without requiring the brushes to be shifted.

The switchboard is of the standard form and construction, there being one complete panel for each generator, containing the necessary switches and instruments, including an automatic circuit breaker of the magnetic blow-out type, quick break switches, etc. Each feeder panel is designed for two circuits, and contains circuit breakers and an ammeter for each circuit. There is also a total output panel, with Thomson recording wattmeter, and a leakage panel according to the Board of Trade requirements.

The lights for the power house are supplied from one of the British Thomson-Houston Company's marine type of generating set, consisting of a high-speed vertical engine, coupled direct to a four-pole 10 kilowatt generator, running at 656 revolutions per minute. The lighting is both by arc and incandescent lamps.

An overhead traveling crane, built by Messrs. Jessop and Appleby, of six tons capacity, runs the whole length of the engine house. The lifting and traversing gears are arranged so as to be worked by hand from the floor.

There are two main feeder cables for the tramway supply, each feeder being looped at intervals into a switch pillar. Each of these switch pillars contains six quick-break switches, so arranged that any section of the line or feeder may be cut out without interfering with any of the other sections. The switch pillar also contains a magnetic blow-out lightning arrester, connected to the trolley line.

The overhead trolley line construction, which is on the span-wire system throughout, is erected in the following manner: The poles, which are 29 ft. 6 in. in length, are built up in three sections of 5 in., 6 in. and 7 in. tubular steel, made with overlapping joints, shrunk together while hot. This type of pole, while containing a minimum amount of metal, has been specially designed to sustain the strains incidental to the operation of an overhead trolley system. The poles are spaced at an average distance of 120 ft. apart. There are two trolley wires throughout composed of No. O. B. and S. gauge hard-drawn copper wire, divided up into half-mile sections, as required by the Board of Trade. The track, which has been relaid by the Dublin United Tramways Company with a 7-in. girder rail, has been efficiently bonded with Chicago 4/0 by 30 in. bonds. It is also cross-bonded at short intervals. There are no grades or curves of any note throughout the entire length of line, and there is only one point where there is any variation in the height of the overhead

line over the track, this being where the track passes under a railway bridge. Here the line is dropped from an elevation of 21 ft. to 17 ft.

Both the original and the new tracks in the car shed and the repair shops have all been wired, so that the cars may be moved electrically to any desired place.

Fifteen motor cars have been equipped for this tramway service, 12 of the bodies having been built by Messrs. Milnes & Co., Birkenhead, and the remaining three by the Dublin United Tramways Company. The cars are double-decked and are exceedingly roomy. They are built to accommodate 54 passengers each, of whom 25 are carried inside. These cars are similar in most respects to those in operation on the company's Dublin and Dalkey section. The cars are electrically lighted. The car bodies are mounted on "Peckham" cantilever trucks, with 33 in. wheels. The springs supporting the car body comprise four elliptical and twelve coil springs, so combined and graduated that the weight of the car comes first upon the elliptic springs and as the load increases the spiral springs come into play. The brake beams are of wrought steel bars, the brake leverage being ten to one advantage. The brake-shoes are so constructed as to be interchangeable and easily removed without loosening a bolt. Each truck is also fitted at either end with an adjustable life and wheel guard which can be adjusted to any desired height from the track.

The electrical equipment of each car comprises a trolley-pole and base of the swiveling arm type, with the wheel mounted on a pivot fitted so as to prevent it from catching in the span wire. There is also a special arrangement for bringing the wheel back into line should it jump the wire. This wheel is so constructed that should it wear through the rims will not drop off. The trolley pole is of light steel insulated by means of braiding, the pole being insulated from the socket, which is on a pivoted base supplied with ball bearings. The electrical connections between the fixed and rotating parts is of such construction that the cables cannot be twisted off. There are two main motor switches, one at either end of the car, one of these being so designed as to act as an automatic magnetic blow-out circuit breaker. The controllers are of the British Thomson-Houston "K2" series parallel type, and embody the magnetic blow-out principle. They are fitted with an interlocking arrangement by which the power handle cannot be moved except when the reversing handle is set to run either forward or backward. The reversing handle is so designed that it can only be moved at the "off" position. These controllers also contain an emergency stop switch whereby the car can be very quickly stopped, owing to the breaking action effected by so connecting the motors that they become, for the time being, generators. This emergency stop is entirely independent of any extraneous source of electric supply.

The motors are of the well-known "GE 800" type, there being, as usual, two motors on each truck.

It is proposed to extend the line from Dollymount to the sea-side resort of Howth, a distance of about six miles, and ample room exists in the power-house for the plant rendered necessary when this extension is carried out.

A Third Rail Line in Germany.

The Wann See Railway, for which there was lately issued a prize competition for proposals to enable the increased traffic to be coped with, is to be worked by electricity if the trials now to be made are successful. The line, which is about $7\frac{1}{2}$ miles long, is between Berlin and Zehlendorf. The trial train is expected to make 15 double journeys per day with a load of 210 tons each. The current is to be conducted to the train by a special conductor rail 1 ft. above the edge of the running rails. The conductor rails will be carried upon insulators placed four or five yards apart. The latter will be fixed upon wooden saddles, which will be firmly attached to the ends of

the sleepers. The return current will pass through the running rails. The compressed-air brake now in use is to be retained; the air will be pumped by electromotors, but trials will also be made with an electrical brake. The line current will be used to light the carriages. Accumulators on the cars will be employed to prevent extreme fluctuations in the light.—*Electrical Engineer, London.*

THE RAND CENTRAL ELECTRIC POWER PLANT.

Stretching east and west of Johannesburg for a distance of about 25 miles is the gold-mining district of the Rand. There is an enormous amount of power demanded for the various operations connected with the industry on the reef; in fact, it is estimated that a capacity in steam engines amounting to a total of 20,000 HP. is installed amongst the various mines in the district. The inefficiency with which this power is developed, generated as it is by units of small capacity, coupled with the high price of coal at the mines, in consequence of the oppressive railway rates, render the cost of power to the mines under this regime prohibitive. This combination of conditions was the cause, some time ago, of a proposal to establish a central power generating station in or close to the Rand. The first idea was to develop the power from the falls of the Vaal River, but lack of water in the dry season was the cause of this plan being abandoned. It was finally decided to erect a power station near the shaft of the Brakpan coal mine of the Transvaal Coal Trust Company. A franchise was obtained from the Transvaal Republic for the lighting of Johannesburg and for transmitting power by an overhead transmission line to the Rand. A contract was also entered into with the coal company binding it to furnish all the coal required by the Central Electric Works for a period of 55 years. Work was started on the station in September, 1895, and, owing to an agreement with the railway company, the material was transmitted to the site without transshipment.

The station is situated about a mile and a-half from the colliery, but a down grade exists the whole length of the line from the latter to the station, so that the only need for a locomotive under the present arrangements is to haul back the empties to the colliery. The coal or "slack" is tipped from side-discharge trucks on to a corrugated iron tunnel, whence it falls into a spiral conveyor, which in turn discharges on to a belt elevator at the western end of the boiler-house. From the elevator the coal is distributed at intervals into the bunkers by two spiral conveyers which run the whole length of the boiler-room.

This room is 250 ft. long by 48 ft. wide. It has two wings, each capable of housing five boilers. The two iron chimneys are 16 ft. in diameter at the base, and 10 ft. at top. Automatic stokers of the Leach pattern are used. The fuel conveyers and stokers are worked by electric motors. Eight boilers are at present installed, and two more are to be erected. They are of the Steinmuller multitubular type each of 600 IHP., with 3,300 sq. ft. of heating surface, and supply about 2.2 lbs. steam per hour per square foot of surface. The steam pressure is about 200 lbs. The limited supply of water available has rendered necessary careful arrangements for supplying and purifying the feed water. Surface condensers are used, and no fresh water is allowed to enter the boilers without being filtered. A reservoir of a capacity of 22,000,000 gallons is adjacent. The engine and dynamo room measures 230 ft. by 76 ft. wide. The framework is of iron, and the roof as well as the walls are of wood covered with corrugated iron. A 25-ton overhead traveling crane spans the width of the room. There are four units at present installed, and there is room for a fifth. The engines are triple-expansion, and of the vertical marine type manufactured by the Sächsische Maschinen Fabrik of Chem-

nitz. The high-pressure cylinders have a diameter of 22½ in., the intermediate cylinders are 36 in., and the low pressure 57 in. in diameter, the stroke being 35½ in. These engines have a normal brake horsepower of 1,000, and are capable of developing a maximum of 1,500 IHP. Coupled direct to each engine is a 1,145-kilowatt three-phase generator and its exciter. The armatures are stationary and in the form of a ring, having an internal diameter of 15 ft. The field magnet revolves within the armature, being keyed to the shaft driven from the engine. The speed is 100 revolutions per minute. Each of the generators weighs 80 tons and with their engines are mounted on a continuous bed of concrete resting on hard rock about 16 ft. below the level of the floor. Three only of the units are in constant use, the fourth being held in reserve. The generators supply current at 700 volts pressure.

In a gallery at the eastern end of the building are located the step-up transformers which raise the pressure from 700 to 10,000 volts for the transmission of the current on the line. The latter consists of six copper conductors carried on steel poles 20 ft. high, made by the Mannesmann Tube Company of South Wales; the cables are fitted with a wire net-like arrangement underlying them for the purpose of catching and keeping them from the ground in case of breakage. The lines are set spirally throughout their course, and the cables are topped by a line of ordinary barbed wire to act as a lightning conductor. Further to guard against the effects of lightning the Siemens & Halske lightning arrester is employed. The latter consists of two heavy copper wires bent into a certain shape. These wires are held in cast-iron clips attached to porcelain insulators, while the lower ends of the wires are adjustable, so that their distance apart at the place where they are closest together may be altered. One wire is put to earth and the other connected to the circuit to be protected. When the circuit is struck by lightning the arc which follows travels upwards between the two horns (as high-pressure arcs are known to do) and fails when its length becomes too great to sustain. About 2,000 volts is the lowest limit of pressure for the line which this arrester will protect. No rain guard is required if the distance apart of the horns is not too small.

Close to each mine taking current a transformer house is erected, containing besides transformers the measuring instruments and safety devices. The transformers in these little sub-stations step the pressure down from 10,000 to 120 volts for lighting or to 240 or 500 volts for motors. There are two methods of charging for power supplied. By one rating £45 per annum is charged per horse-power measured at the motor shaft, the power company putting up and maintaining all the electric plant; on the other system 1.85d. is charged per kilowatt hour as measured by meter. This latter payment is, however, subject to a sliding scale, by which the rate is varied according to the time of running and the amount of current used.

The longest stretch of line is to Krugersdorp, some 28 miles from the station. It is intended to light various suburbs of Johannesburg by this power, and already some railway stations are being lighted. The demand for current is good and eight or nine mining companies are already customers and using the power for various purposes, including air compressing, pumping, ore reduction, hauling and the working of slimes plant. There are now about 38 motors on the circuit, varying in capacity from 3 HP. to 250 HP. It should be added that the whole of the work has been carried out by Messrs. Siemens & Halske.

Species of Cathode Rays.

According to E. Wiedemann and G. C. Schmidt, cathode rays emerge from a point of the cathode in two essentially different manners. The first kind consists of a solid cone, which produces a patch on the glass wall. The second is a hollow cone, which produces a green ring on the tube wall. Both forms

† From *The Electrician*, London.

occur simultaneously. To study the second kind in their utmost simplicity the authors first of all experimented with electrodeless tubes between the terminals of a Lecher wire system with one bridge. The vessels used were glass spheres, which were placed against a ball electrode. A small bright point appeared against the electrode, and a hollow cone of rays proceeded from that point. Measurements of the angle of this cone showed that it slightly decreases as the sphere decreases in size, but that it rapidly increases with the curvature of the electrode and with the exhaustion of the vessel. If the electrode is not a sphere but a circular ring of thick wire with its plane at right angles to the surface, the figure produced on the wall is of an oval shape, with its major axis normal to the plane of the ring. Ring figures may also be obtained in electrodeless cylinders terminating in plane glass plates. If a ball electrode or a ring is placed against the center of one of the plates, rings and ovals are obtained just as in the case of the sphere. In one experiment of considerable theoretical interest, the two plates were covered with tinfoil on the outside. A chalked screen, *b*, was introduced into the cylinder, and a smaller paper screen, *c*, was placed parallel to the former a short distance below it. A bright red ring then appeared on the chalk, separated from the cylindrical walls by a black ring. Inside the red ring there was some light, especially towards the center. As exhaustion proceeded the dark ring steadily crowded the bright ring towards the center. The screen *c* threw a shadow on *b* corresponding to cathode rays perpendicular to the plane ends. The authors conclude that the cathode rays proceed from the separating surface between a solid and a gas in the direction in which the currents producing the oscillations traverse that surface.—*London Electrician*.

A correspondent writes: "Whenever I think I have found anything new about Roentgen light I have only to turn to the work 'Roentgen Rays and Phenomena of the Anode and Cathode' to find that some one else discovered it first."

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

Motion of the Ether.

It will be remembered that Michelson some time ago, says the *Electrician*, London, endeavored to detect a difference in the motion of the ether at different heights above the earth's surface, by sending a beam round a rectangular path 200 ft. long in a horizontal direction and 50 ft. long vertically. No trace of relative motion was detected, and the conclusion was that either the ether is quite unaffected by the earth's motion, or that it is dragged along with it to a distance of many thousand miles above the surface. H. A. Lorentz (Verslag Akad., Amsterdam, November 10, 1897,) criticises these conclusions in detail. It is not inconceivable that the glass covers of Michelson's iron tubes do not allow the ether to penetrate, although they probably do so. On the other hand, an extension of the earth's influence to a distance comparable with the earth's diameter is not unthinkable. If the dragging is analogous to that exerted by a gas upon a solid sphere traversing it, the velocity imparted to the ether by the earth could well be $\frac{1}{2}$ of that at the surface at a height equal to the radius, and $\frac{1}{4}$ at a height equal to the diameter of the earth. But in that case some displacement of the fringes should have been observed.

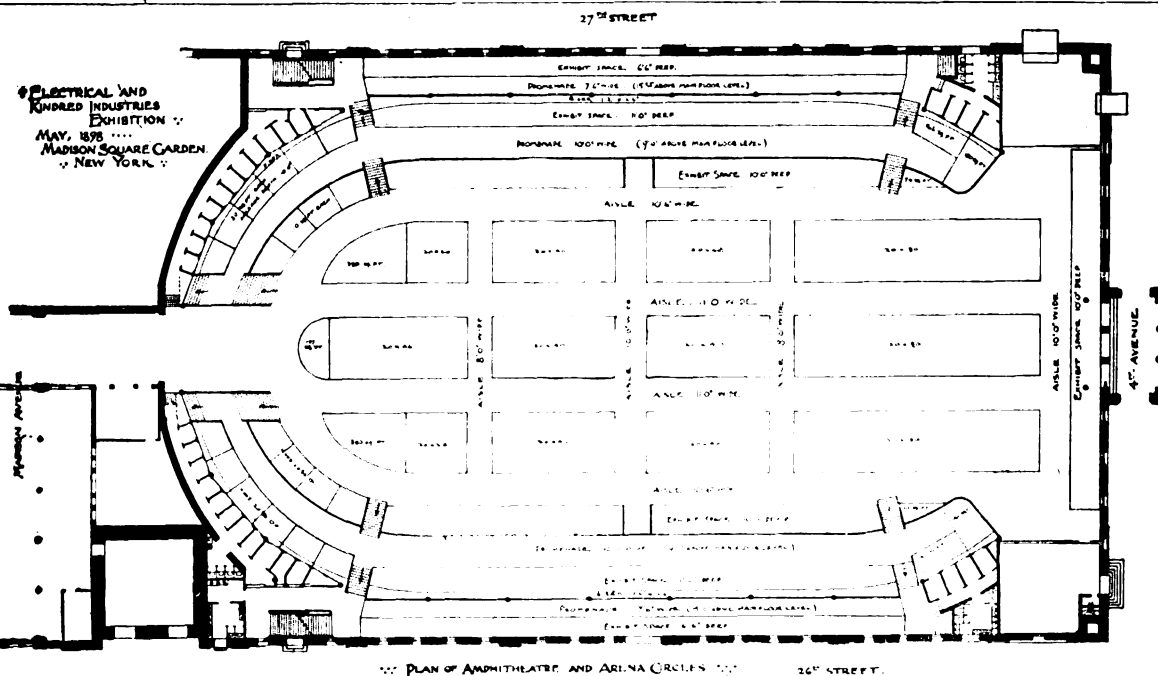

For at midday or midnight, when the earth's surface moves in the direction of the earth's path or against it, and the dragging is likely to reach a maximum, a displacement of $\frac{1}{4}$ th of the distance between two of Michelson's fringes should have been produced. This would have been well within the limits of observation.

THE ELECTRICAL SHOW.

Interest in the next Electrical Show, to be held in Madison Square Garden in May, has already gone beyond the electrical into the kindred trades and is surprisingly strong in all branches. Everybody remembers the splendid success of the show in 1896.

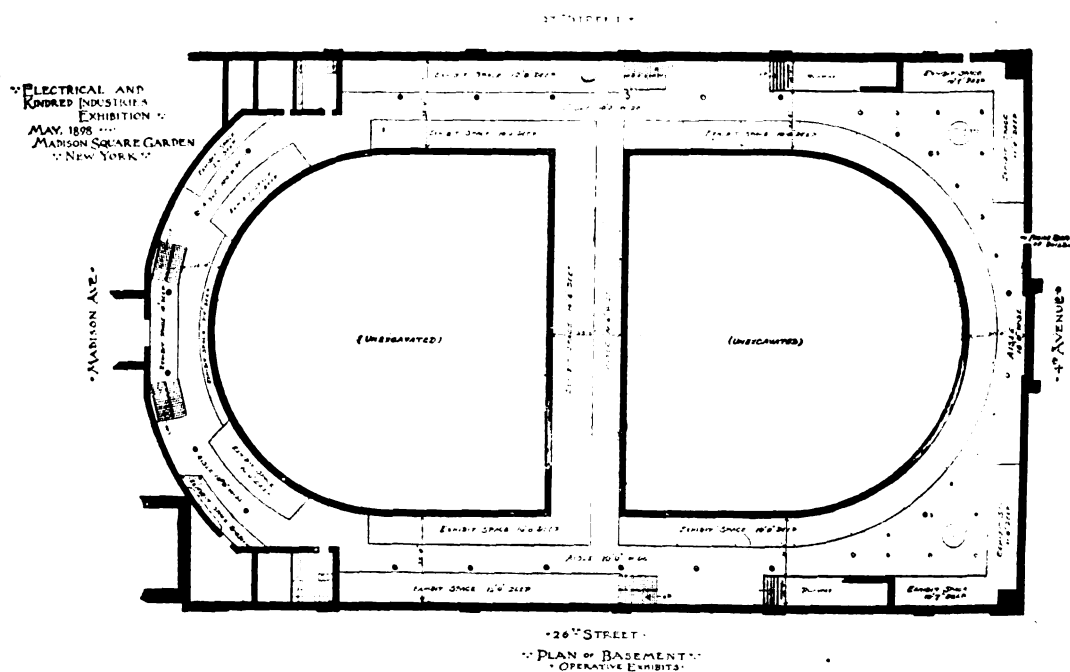

the several months before, it will be readily seen that late comers may be losers.

When the management took a lease of Madison Square Garden it was thought to be a rather bold step. As the plans are now developing, it is evident that so big a building is absolutely necessary. The exhibitors cannot but profit by the larger, finer, better known and more centrally located building. The advantage of location and building, the increase both in variety and number of exhibits will certainly draw a much larger crowd. There were over 300,000 admissions in 1896, and it seems reasonable to expect that the number will run up pretty close to the million mark in 1898. Other comparisons with the

Then it was held in a building comparatively unknown for such exhibiting purposes, yet it attracted not only the trade but great throngs of people from the territory within 100 miles of New York. The exhibitors themselves were paid many times over in business for the cost of their respective exhibits, and the best evidence of this fact is in the early demand

last show run in just as large proportions. For instance, there was only one battery of boilers in operation in the 1896 Exhibition. From the arrangements already made, there will be at least three in the Madison Square Garden show. The engine and dynamo exhibits will exceed those of the last show by about three to one. All these things suggest to

from former exhibitors for increased allotments of space.

Contracts are already in for more than one-half of the total space sold in 1896. When it is remembered that the Exhibition is five months away and that at the last one, as usual in such exhibitions, more space was sold just before the opening of the show than in

intending exhibitors the importance of speed in securing space. While the Garden is very much bigger than the last Exhibition building, the demand for space is even greater in proportion than the increase of space, and of course the walls of the Garden put up an unyielding limit to the supply. The accompanying diagrams show a proposed arrangement

of exhibits in the amphitheater of the Garden where apparatus, supplies, etc., will be located, and the basement in which will be the generating exhibit and steam specialties.

From interest already taken in it by boiler, engine, pump and steam specialties companies, it is evident that the illustration of the various apparatus and supplies will be complete, varied and interesting, and public interest in these things will no doubt lead the newspapers to give the show a great deal of notice.

It seems proper to say a word about this generating exhibit. In the old building with a smaller and less interesting plant and only one entrance by an obscure stairway from the main hall, it proved to be a feature of public as well as trade interest. Enough interested people found their way to it to make it profitable to the exhibitors. In Madison Square Garden, not only will the exhibit be larger, more varied, more interesting, but it will be more accessible. There will be at least four entrances from the three sides of the building, and the skill and care in placing the exhibits, pointing out the features and properly advertising them, which made the last operative exhibit successful, ought to make this one at least four or five times as successful.

The Manufacture and Storage of Acetylene Gas.

We are very glad to see that the Board of Fire Commissioners of Jersey City have at last adopted strict regulations regarding the manufacture and storage of acetylene gas. The regulations provide as follows:

"That the manufacture of carbide of calcium or the liquefaction of calcium of carbide be prohibited except under certain prescribed limitations to be designated by the board. That it declines to permit the use of any acetylene gas regenerator in this city except those devices first submitted to the board for careful test, examination, and approval of the board. That after the careful examination made into the methods of operation of the Bournonville gas regenerator, and finding the same to be operated on safe scientific principles, and in view of the small quantity of carbide treated by said device and the careful storage and distribution of the same, that the embargo laid by the board against the use of this machine be withdrawn and its operation sanctioned, provided that the methods now employed be not altered or made more dangerous.

"It is further provided that the use or storage of calcium of carbide be confined to quantities of five pounds each, which must be stored in heavy block tin vessels, and until ready for use hermetically sealed, and that no dwelling, factory, or other building be permitted to keep on storage a total quantity in excess of twenty-five pounds in cans or vessels of five pounds each.

"All parties desirous of storing in this city a quantity of calcium carbide or liquefied acetylene gas in excess of the limitations above defined to be allowed to do so only upon formal request to the board and special permission obtained therefrom."

Help to fight the Electrical Trust by subscribing for ELECTRICITY.

ELECTRICAL EXPORTS.

The United States Treasury Department has completed the compilation of the statistics covering the exports and imports during the last fiscal year. Hon. Worthington C. Ford, the head of the division which is entrusted with the preparation of these statistics, states that the exports of our manufactures have never been so large as they now are, and the rapid increase during the last few years is indicative of a growing appreciation of American products abroad.

The statistics which relate to electrical apparatus constitute a highly interesting exhibit to the manufacturers and dealers in these lines. While the imports of electrical apparatus are nil, the exports, as

will be seen by the following list, amount to a good round sum:

BOOK REVIEWS.

ARITHMETIC OF THE STEAM ENGINE. By E. SHERMAN GOULD. M. Am. Soc. C. E. 8vo, p. 104. New York: D. Van Nostrand Company. Price, \$1.00.

This attractive little volume, although it contains nothing strikingly new regarding steam, will be found exceedingly useful to anyone interested in steam and its applications to the steam-engine. The work contains a large number of problems that arise in everyday practice, and in each case gives a simple method of arriving at an accurate solution. Several carefully compiled tables are to be found at the end of the volume, on the properties of saturated steam and on hyperbolic logarithms. Altogether this little volume would seem to fill a long felt want for a simple and practical method of determining questions that are constantly arising in the application of steam.

MECHANICAL DRAFT. By B. F. STURTEVANT. Pp. 377. Boston, Mass.: Sturtevant Engineering Co.

This valuable work discusses at great length the subject of mechanical draft. No efforts have apparently been spared to make the work complete, accurate and thoroughly up to date. There seems scarcely any doubt but what the subject of mechanical draft and its advantages has been heretofore more or less overlooked or at most discussed in a cursory manner. This volume, therefore, which is fully illustrated and which shows by actual comparisons taken from practice the great advantages to be derived by the use of mechanical draft, will be welcomed by engineers generally. It not only treats of mechanical draft, but of the efficiency of fuels, efficiency of boilers, steam, combustion and various other topics in this line. Besides being handsomely illustrated, valuable tables, diagrams and charts are scattered throughout the volume, showing the results of tests of steam plants in various parts of the country.

Everyone engaged in the design of works of this nature would do well to procure this work, if only to read Chapter XI, which very forcibly brings out the advantages of mechanical draft.

CANADIAN NOTES.

A comparative statement of earnings of the Montreal Electric Street Railway shows the earnings of the month of December last were \$113,128.91, as against \$103,116.02 for the same month last year. The total earnings for the last three months of 1897 were \$340,351.60, giving an increase over the like period in the year previous of \$27,306.63.

The Niagara Power Company, if forced to develop power on the Canadian side of the line, must look to Toronto, it is said, for an immediate market, to which city the question of power transmission is already being considered by the company. The rival concern, which proposes to utilize the Welland River power, also looks to the city of Toronto for its most important market. The Electric Light Company of Toronto, which has a large amount invested in plant for the production of electricity from steam, will not eagerly welcome the advent of water-produced power and is making a strong fight against its introduction.

The Dominion Government purposes putting in an electrical installation in all the departmental buildings at Ottawa. At present the Parliament block is electrically lighted. The intention is to erect a power house to supply all the Government buildings with electric lights, and also with energy to work electric pumps for fire purposes in every building.

A motion has been introduced into the Ontario Legislature to the effect that, in the opinion of the House, the water-power of Niagara Falls and rapids being one of the great natural resources of the province, should be developed and utilized for the benefit of the Canadian people, and that to this end the Government should favor all bona fide enterprises proposing the development of this power.

LEGAL NOTES.

The judgment secured by the Atlantic Trust Company for \$95,426 on its counterclaim in a suit brought against it by the Consolidated Electric Storage Company has been reversed by the Appellate Division, New York. A new trial is granted and the opinion is expressed that plaintiff was entitled to recover the balance remaining undisposed of of the sum of \$215,000 deposited with the defendant in pursuance of an agreement between the plaintiff and defendant and other parties made in June, 1890. Under this agreement the United Electric Traction Company gave its note for \$215,000, with collateral security, for the purpose of securing that amount to the Brush Electric Company. The defendant agreed to pay to plaintiff any part of this sum not needed to secure the Brush Company. The Traction Company failed to pay this sum, and the collateral security, consisting mainly of stock of the company, turned out to be valueless. Then it was that defendant claimed a reformation of the contract and a judgment in its favor. The opinion of the court was by Justice Ingraham, Justice O'Brien dissenting.

Judge Showalter has appointed General John McNulta receiver for the Calumet Electric Railway Company, Chicago, to succeed John C. McKeon. The appointment was made in view of the fact that General McNulta was recently appointed receiver for the National Bank of Illinois, and that the Calumet Electric Railway is an asset of that bank. The bank financed the Calumet company for \$2,700,000.

Motions for a new trial have been filed in the case of Louis M. Packer of Lynn vs. the Thomson-Houston Electric Company, in which the plaintiff sued for \$100,000 for the loss of both hands in an under-cut machine at the defendant's works and was recently awarded \$20,000 by a jury in the Superior Court at Salem, Mass. Both sides ask for a new trial. The plaintiff wants the verdict set aside upon the ground that the damages found by the jury are inadequate.

R. E. Rust, receiver of the National Electric Manufacturing Company of Eau Claire, Wis., has been discharged by the court.

Leslie W. Ryan, a well known lawyer of Boston, and one of the counsel for the Reorganization Committee of the Thomson-Houston Electric Company, was arraigned before Judge Cowing in the Court of General Sessions, New York, on the 3d inst. upon a charge of perjury. An indictment was found more than a month ago on the complaint of Henry Winthrop Gray, the receiver for the Thomson-Houston Company. It was alleged by Mr. Gray that in winding up the affairs of the company Mr. Ryan made an affidavit that he had turned over to the receiver \$70,000 to be used for the benefit of the creditors. Mr. Gray says he never received this money, and that he has been placed in a false light, inasmuch as he has made no accounting for this sum. Mr. Ryan when taken into custody declared his arrest an outrage, and asserted through his counsel that he had paid the \$70,000 to the creditors of the company through another channel than Mr. Gray, who was incensed against him on that account and preferred the charge. The court held Ryan in \$2,500 bail.

The jury in the suit of the Fort Wayne Electric Corporation against the Franklin Electric Light Company, at Cape May, N. J., returned a verdict for the Fort Wayne company, giving it \$12,423.05. The amount sued for was \$16,700 and interest, which was the cost of the plant when built about a year ago. The case will probably be appealed by the Fort Wayne company.

American Association of Inventors and Manufacturers.

The eighth annual meeting of the American Association of Inventors and Manufacturers will be held in Washington, D. C., on the 18th inst. This association has for its object the maintenance, fostering and protection of the patent system of the United States, with the desire to increase the efficiency of operation and to promote the stability of patent property.

The association has also in view steps to procure

from Congress legislation authorizing the Patent Office, a department of the Government which pays all of its expenses out of its income, to spend so much of that income as may be necessary for the scientific, thorough and efficient examination of applications for patents, to the end that patents may be granted only for inventions which are undoubtedly new.

New York Electrical Society.

The 184th meeting of the New York Electrical Society will be held at the College of the City of New York, Twenty-third street and Lexington avenue, on the evening of January 12 at 8 o'clock.

Mr. S. Dana Greene will read a paper on "The Relations Between the Customer, the Consulting Engineer and the Electric Manufacturer."

It will be the aim of Mr. Greene in this paper to assist in bringing about that better understanding between these departments of the industry on which much of its welfare and prosperity depends.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

GENERAL NEWS.

What is Going On in the Electrical World.

Albany, N. Y.—The construction committee of the water board, or at least two of the three members—Messrs. Hazen and Bailey—recommend the use of electricity as the motive power for the pumps at the filtration plant, bids for which will be received between January 15 and February 15. In their reports Mr. Hazen estimates cost of steam plant complete at \$27,900, and Mr. Bailey at \$21,800. Mr. Hazen estimates cost of construction of electric plant at from \$30,000 to \$35,000, and Mr. Bailey at \$37,830. The use of electricity was recommended in both reports.—The "Times-Union" says: "The work of constructing the roadbed for the proposed electric railway from Greenbush or Rensselaer to Nassau will not be resumed until spring. The reason is the contractors, J. M. Sullivan & Co., of New York, are loth to put any more money into construction until the finances of the company assume a brighter outlook. The contractors say that they have expended eighty thousand dollars thus far and want some money from the railroad company. The latter hold an agreement with a banking firm in New York to take the entire issue of bonds, \$325,000, as soon as the road is completed."

Atchison, Kan.—The Atchison Gas, Electric Light & Power Company for a consideration of \$100,000 has conveyed all its property to the Atchison Railway, Light & Power Company, and B. P. Waggener conveys Forest Park to the same company for \$25,000. The officers of the company are: J. P. Pomeroy, president; W. P. Waggener, vice-president; C. S. Hetherington, treasurer; J. M. Chisham, secretary, and J. A. Bendure, superintendent.

Aurora, Ill.—A company is being formed among the business men of Aurora for the manufacture of an electric railway signal. E. S. Hobbs is president of the company and E. D. Warner of Jackson, Mich., who holds the patent, will act as manager. A factory is to be started here and the stability of the men whose names appear in the list of stockholders assures the success of the concern.

Berlin, Ger.—The German Transoceanic Electric Company, with headquarters in Berlin, has been formed, with a capital of 10,000,000 marks, for the purpose of erecting electrical stations in America. A central station will first be established at Buenos Ayres for lighting and general supplies.

Brookfield, Mass.—Capitalists interested in the Southbridge & Sturbridge Street Railway Company and the Warren, Brookfield & Spencer Street Railway Company have matured plans to connect these two lines by building an electric railway from Central Square in Brookfield, to a point near the Worcester south agricultural grounds in Sturbridge. It is expected that the new road will be built this year. It will be about seven and a half miles long.

Chicago.—Mayor Harrison at the request of Chief Swenick of the Fire Department will ask the city council for authority to separate the electrical bureau from the fire department at the city hall and make each independent of the other with its own head. The bureau as it now is sprang up as a result of the use of the fire alarm system and always has been connected with the fire department. Since its establishment, however, it has been extended until the superintendent of city telegraph now has charge of all the wires in the city, the enforcement of the laws pertaining to them and the superintendency of the various municipal lighting stations.

Cincinnati, O.—The Standard Electric Works has changed its title and has taken out incorporation papers as the Standard Electric Company and with a capital stock of \$50,000. Captain E. Y. Cherry will continue as president of the concern and the other officers remain the same.

Cleveland, O.—The Cleveland, Kent & Ravenna Electric Railway is to be the name of a new line which a number of capitalists have in contemplation. As the title indicates, the road is intended to connect Ravenna with Cleveland. Among those said to be interested are Richard L. Palmer and Col. Vincent A. Taylor of the Chagrin Falls Electric Railway.

Colorado Springs, Col.—A system of electric signal and messenger service similar to that of the American District Telegraph is to be established here by M. A. Liddy, J. E. Voorhees and others. A twenty-year franchise has been granted to Mr. Liddy by the city council.

Detroit, Mich.—The "News" states that the Jenney Electrical Company, which Mayor Maybury expected to locate in Detroit, has gone to Madison, Wis. The mayor says it forsook Detroit because the owners received no encouragement here.

Dubois, Pa.—The Dubois Street Railway and Electric Light Company's plant has been purchased by a syndicate headed by John E. Dubois.

Great Barrington, Mass.—A company to be known as the Stanley Instrument Company was launched here on the 28th ult., the object being to establish works in this neighborhood for the manufacture of electrical instruments devised by Messrs. Stanley and Darlington, two of the directors and both of wide reputation as electricians. The officers of the company are: President, Frank H. Wright; vice-president, William Stanley; manager, Frederick Darlington; treasurer, John H. C. Church, all of Great Barrington; clerk, John S. Fuller. The directors are: Frank H. Wright, lawyer, of Great Barrington; Charles E. Yerkes of Chicago, president of the Siemens & Halske Company; John L. Dodge, president of the Mahawee National Bank, Great Barrington; Parley A. Russell, Great Barrington; John B. Beebe, physician, Great Barrington; Frederick Darlington, Great Barrington; W. H. Browne, manager of the Royal Electric Company, Montreal, Can.; Charles R. Huntley, general manager of the Buffalo General Electric Company, and William Stanley of Pittsfield. The capital stock of the company is \$75,000. In its announcement of the formation of the company the Great Barrington "Courier" says: "It is a well-known fact that Pittsfield has profited to an almost incalculable extent by the benefits flowing from the location of the Stanley Electric Manufacturing Company in that place, and it is believed that with the growth and development of the business of the company just organized, Great Barrington will receive a very substantial benefit in a manner which will be felt by all the people of the town."

Hagerstown, Md.—It is reported that a company of local capitalists is anxious to build an electric light plant in this city if the street commissioners decide that the electric light company now operating here has forfeited its franchise by violating its contract.

Hoboken, N. J.—The electric locomotive which is to draw freight trains on the Hoboken Shore Road made its initial trip over the road on the 4th inst. and worked satisfactorily, moving with apparent ease eight loaded freight cars, weighing about 260 tons. The locomotive is similar to those in use in the Baltimore tunnel. The Shore Road is only two miles long, and was built to facilitate the transportation of freight to and from the steamship docks.

Holland, Mich.—It is understood here that the financial difficulties which stopped work on the Holland & Lake Michigan Electric Railway are now being settled and work will be resumed on the road as soon as the weather will permit. The extension of the line to Saugatuck is now assured.

Hudson, Wis.—Christian Burkhardt has leased his electric light plant to Christian Wangsgard, who will operate it from the big dam, four miles from the city. A power house will be built. The improvements will cost several thousand dollars.

Indianapolis, Ind.—The "Sun" states that the Jenney electric plant, destroyed by fire several months ago, will be rebuilt in this city. The company has been capitalized at \$100,000 and \$70,000 has been taken.—At a meeting of the shareholders of the Citizens' Street Railway Company of this city, held in Philadelphia on the 30th ult., the resignation of President Kennedy Crossan was received and accepted. Vice-president W. W. Kurtz also presented his resignation, but at the request of the shareholders it was withdrawn. Mr. Kurtz will act as president for the present.

Jamaica, L. I., N. Y.—The Queen's County supervisors have granted a franchise to the New York & North Shore Railroad Company to lay its rails over several of the county roads in the towns of Newtown and Flushing and over the Little Neck bridge. All the necessary permits have now been obtained and the company, which is an allied organization of the New York & Queens County line, will at once extend its line from College Point to Whitestone, Willets Point and Manhasset, and from Flushing to Jamaica Village through Hillside avenue to Richmond Hill, thence to Middle Village, and there it will connect with the Calvary Cemetery line to Long Island City. A continuous line will thus connect Long Island City, Newtown, Flushing and Jamaica.

Jamestown, N. Y.—Much interest is manifested again in the project to build a railway from Mayville in this county to Warren, Pa., to pass through the villages of

Panama, Grant, Sugar Grove and other smaller settlements. Representatives of Eastern capitalists who were present at a meeting held a few evenings ago at Panama stated that if the right of way could be secured on reasonable terms there would be no doubt as to the building of the road during the coming summer.

Kansas City, Mo.—Jacques Morgan, city electrician, has submitted a report to the aldermen placing the cost of a 225 lamp plant, exclusive of the site, at \$99,640. The plant would be a 375 lampstation of three dynamos, as it is necessary to have one dynamo in reserve in case of accidents to the others. The most expensive item is the 225 miles of wire necessary for 225 lamps. The cost of this is estimated at \$70,125. There are now 211 arc lights in use by the city at \$110 a year for each lamp, or a cost of \$23,210 each year for Kansas City's street lights. Mr. Morgan thinks the cost of a city plant too great to make it practicable.

Lake Charles, La.—The Lake Charles Street Railway Company have decided to equip their lines with electricity, and will probably use the storage battery system.

Lancaster, Pa.—William B. Given of Columbia, receiver of the Pennsylvania Traction Company, has just assumed the duties of general manager of all the lines controlled by him. The office of superintendent of the lines centering at Lancaster and Columbia having been abolished, Frank S. Given has been appointed assistant general manager with headquarters at Lancaster, and he will fulfil the duties of superintendent of all the lines.

Lincoln, Neb.—The Lincoln Traction Company, the successor of the old street car company, is now in full possession of the street railway system of this city. The officers of the company are: Manager, Brad D. Slaughter; superintendent, J. H. Humpe; superintendent of motive power and construction, H. C. Hartley; cashier, E. B. Ransom; assistant cashier, Norman Belcher.

Marinette, Wis.—The Marinette & Menominee Electric Company, which has been organized here with a capital stock of \$200,000, proposes to improve the power at Chippie Rapids, on the Menominee River, and furnish power to street railways and a paper mill. The improvement will cost \$150,000. The incorporators of the company are Isaac Stephenson and John Spalding, of Chicago; Fred Carney, Sr., A. C. Merriman, F. M. Brown, H. C. Higgins and G. W. Hanley, of Marinette, and Edward, Daniel and August Spies and S. M. Stephenson, of Menominee, Mich.

Milwaukee, Wis.—The "Wisconsin" says: "On the additional new lines and extensions to the present system under control of the Milwaukee Electric Railway & Light Company, that company will expend in the neighborhood of \$300,000. This will include the line from North Greenfield to Waukesha, and one from the northern city limits to Whitefish Bay, via (Oakland avenue); also for the College and Country Club line, from Folsom place on Glen avenue to Mineral Spring road, a half mile north of the city limits. There will be, in addition to these entirely new routes, several extensions of present city lines, including that on Vliet street to West Park. The company will also expend \$500,000 or \$600,000 on its new power house and machinery, all of which will be laid out early in the year. For the improvements already decided on and assured, the expenditures during the first six months of 1898 by the street railway company will be in the neighborhood of \$1,000,000."

Mystic, Conn.—The committee on new enterprises of the local board of trade have nearly completed plans for establishing an electric power plant at Mystic. It is proposed to do business under the charter granted by the General Assembly in 1893 to Solomon Lucas of Norwich, Francis M. Manning of Mystic, and George D. Whittlesey (deceased) of New London, under the name of the Mystic Electric & Gas Light Company. The committee visited Norwich and conferred with Mr. Lucas and satisfactory arrangements for the use of the charter were made. Mr. Lucas will be one of the shareholders in the company.

New York.—The talk of changing the motive power of the Manhattan Elevated Railroad to electricity has lately assumed a certain earnestness among those pecuniarily and politically interested in the road that promises practical results. If some reliable electrical system is found for the operation of the road, the change would be hailed with delight by every citizen of the metropolis.

Norwich, Conn.—E. P. Shaw, Jr., formerly general manager of the Norwich street railway, is now manager of the system of trolley lines that is to connect Newport with Fall River and is hard at work making preparations for the building of the road. The work of construction will begin at once, in order to have the line in operation by next June.

Phoenix City, Ga.—A prominent local capitalist is at the head of a movement here for the establishing of an electric plant to supply light for the city and for private uses.

Philadelphia.—The Union Traction Company's new power house, built on the site of the one which was destroyed by fire in March last, is now about completed. The new machinery embodies all the latest improvements and the capacity of the plant has been increased. The switchboard is constructed throughout of white marble slabs on a framework of steel, and is double decked. It occupies the entire Mt. Vernon street end of the engine room and is probably the largest railway switchboard in the world, excepting one recently constructed in Chicago. It is equipped with the very latest type of instruments, and in this respect is considered unequalled in convenience and efficiency.

Placerville, Cal.—The Placerville "Nugget" states that C. S. Young, president of the Pacific Coast Electric Power & Construction Company, has taken the contract to build a line sixty-eight miles long, for the purpose of conveying electric power to Fresno. This will be the longest line of the kind ever built.

Quincy, Ill.—A local inventor is working on a fire engine which will be run by electricity, both at fires and en route to fires. He has not yet perfected his engine and refuses to give a description of it to the public until he is further along with it. The engine, he says, will be much lighter than the steam fire engines.

Rockford, Ill.—The car barn of the City Railway Company was destroyed by fire on the 28th ult. Two cars, eleven motors, practically all the summer supplies and equipment, together with valuable tools, were lost. The total loss is about \$8,000. The company carries an insurance of \$30,000.

Savannah, Ga.—The municipal lighting scheme which had gained some headway here has fallen through, the council having passed a resolution giving a five years' contract to the Brush Electric Light & Power Company at \$72 per light per annum.

Seranton, Pa.—The Hubbell Electric Lamp Company is now operating a plant here for the manufacture of an electric bicycle lamp patented by C. J. Hubbell, which the company claims is the first perfect lamp of the kind put on the market. The lamp is also applicable to mine working.

Washington, D. C.—The District Commissioners have returned to Congress without their approval the bill proposing that new franchises to street railroads be sold at public auction. The Commissioners say: "The bill proposed requires that the right to occupy public space in the District of Columbia for street railway purposes shall be sold at public auction to the highest bidder. The Commissioners are unable to recommend favorable action upon this measure. In recent years Congress in granting charters to street railway companies in the District has required the companies to pay 4 per cent. of their earnings as taxes. It seems to the Commissioners that it is a much better plan to require, by law, the companies to pay for their privileges in a fair percentage of their gross earnings than to leave the matter to the uncertainties of a public auction, where an absurdly low price or an excessive one may be bid, to the disadvantage of the Government in one case, or of the company in the other, neither of which is desirable for the public good."—A bill has been introduced in the House by Mr. Wheeler of Alabama authorizing the construction of an electric power station on the Tennessee River. The bill gives W. G. Douglas, G. H. Van Wagner, Harry Mitchell, Nial C. Elting, William Ozden and T. H. Allen permission to erect and operate a power station on the Tennessee river, and to build and operate dams at points on Muscle Shoals and Colbert Shoals which are unsuitable for navigation.

Weedsport, N. Y.—J. D. Edwards has purchased of C. C. Adams & Sons the Van Marter malthouse property and will commence the erection of a power house for his electric light plant as soon as the weather will permit.

Weston, O.—The council has decided to submit the question of obtaining an electric light plant for the town to a vote of the people. No date was set for the election, but it will doubtless be held soon.

NOTES FROM A CORRESPONDENT.

Albany, N. Y.—Open competitive civil service examinations will be held at various places in the State on January 29, for positions in the State service. Among other positions is that of assistant electrical engineer.

Bath-on-the-Hudson.—George Shont, electrician for the Central-Hudson Railroad, has resigned and will accept a position with the Hall Signal Company of New York. Charles Dorr of Troy will take Mr. Shont's place on the Central-Hudson Railroad.

PERSONAL AND MISCELLANEA.

M. S. Robison, lately receiver of the Consolidated Street Railway of Fort Wayne, Ind., is said to have accepted a lucrative position as manager of a Chicago street car line and will remove to that city.

W. O. Smith, superintendent of the Louisville (Ky.) Electric Light Company, was presented on New Year's day with a handsome gold badge by the employees of the company.

A press dispatch from San Francisco states that W. K. Burkholder of that city has gone to Alaska to erect an electric plant to operate an electric road over the Chilkoot Pass. Electricity will be generated at Dyea and transmitted twenty miles to the point where it is to be used. At the pass the telegraph system will be used. In addition to the electric wires, the poles will support cables from which heavy cars will be suspended. The motors will be stationary and the cars will be propelled up the incline by cables on a drum. The machinery has already been shipped and the plant is expected to be in working order in about three months.

The St. Louis "Republic" says: "Georges Apostoli, the noted French physician and surgeon, writes to a brother medico in St. Louis that he has discovered the secret of preventing the evil effects which usually ensue from the application of the X ray. He says that he simply connects the machine with the ground by a metallic circuit. Under that system he has turned the X ray upon hundreds of patients and not once has there been any deleterious effects from the rays. None of the burning, itching sensations which are commonly ex-

perienced have been apparent when the machine used by Dr. Apostoli was in use. According to the noted Frenchman, all that is needed to eliminate the baneful influences of the ray is a connection with the ground in order to complete the circuit."

The marriage of Prof. Alexander Melville Bell, the father of Alexander Graham Bell, the inventor of the telephone, to Mrs. Harriet G. Shibley, a Canadian lady many years his junior, was an event of special interest on account of the age of the bridegroom and the somewhat romantic manner in which the marriage was brought about. A photograph of the lady attracted the attention of the professor, who sought an introduction, was charmed, proposed and was accepted, all within a few months. The wedding took place in New York on the 1st inst., and among those in attendance was the son of the bridegroom, Alexander Graham Bell, and a brother, D. C. Bell. Prof. Bell was born in Edinburgh, Scotland, March 1, 1819. For twenty-two years he was a lecturer at Edinburgh University and at New College. Later he lectured in the London University, and in 1870 came to Kingston, Canada, and lectured in Queen's College in that place. In 1881 he removed to Washington, where he has since lived. He is author of several treatises on elocution. His wife is twenty-five years his junior.

The city council of Joliet, Ill., recently granted a fifty-year electric light and power franchise to Col. John Lambert, who soon after sold the grant to the Economy Light and Power Company for \$30,000, a proceeding which caused a great deal of ugly talk and criticism of the council. Those who indulged most freely in this are now wearing sackcloth, for Mr. Lambert, who is one of the most generous and most enterprising of the citizens, has donated the entire sum to the city with the stipulation that \$3,000 be divided equally between two hospitals and the remaining \$27,000 be applied to the erection of a city hall and library building.

A Denver paper states that a company is being organized to develop the resort features of Ute Pass. At present there is a chain of finely constructed hotels running from Cascade to Woodlawn Park. The new company proposes to develop the resources of the canon by constructing an electric light plant to be run by water power which is now going to waste and to use the overflow from a small dam across one of the canons for an artificial waterfall to be illuminated at night by means of colored lights. During the past summer an expert landscape artist visited the pass and suggested the general outline of the scheme, which is nominally the making of an immense park about seven miles in length. The electricity generated at the one plant will be sufficient to furnish lights for all the hotels as well as a number in the grounds surrounding each. With the scheme as originally suggested carried out, the State would have a veritable electric park supplied with light and beautiful water effects from the abundant water falls in the vicinity.

RECENT COMPANY ELECTIONS.

Cleveland and Chagrin Falls Electric Railway Company, Cleveland, Ohio.—President, V. A. Taylor; vice-president, M. A. Sprague; secretary, Charles Lane; treasurer, William H. Prescott; general manager, L. M. Coe; directors: F. D. Carpenter, L. M. Coe, W. H. Prescott, R. L. Palmer, B. A. Taylor, J. E. Emsien, C. Lane, F. M. Stearns, M. A. Sprague and C. C. Morgenthau.

Skowhegan and Norridgewock Electric Railway & Power Company, Skowhegan, Me.—President, R. W. Brown; clerk, Turner Buswell; directors: R. W. Brown, A. F. Gerald, A. H. Weston, J. P. Clark and L. C. Emery.

COMMERCIAL PARAGRAPHS.

We are in receipt of a new edition of the catalogue issued by the Hazleton Boiler Company, 716 East Thirteenth street, New York City. This book, entitled "The Generation of Power," is fully illustrated and contains any amount of useful information, including numerous tables, extremely convenient for any one engaged in the designing and proportioning of boilers. The catalogue, containing 150 pages, is well worth having and can be obtained by applying to the Hazleton Boiler Company at the above address.

We desire to acknowledge the receipt of an extremely attractive calendar sent us by Alfred F. Moore, the well-known manufacturer of Insulated Electric Wire and Cables, 200 North Third street, Philadelphia.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, acting gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

Beauty, utility and value are happily combined in Hood's Sarsaparilla Coupon Calendar for 1898, kindly sent us by the company. The lovely child's head is in an embossed gold frame, surrounded by sprays of flowers in mosaic, the harmonious pad in blue with clear figures, and the coupons by means of which many valuable books and other articles may be obtained, make up the most desirable calendar of the kind in print. The first coupon article is Hood's Practical Cook's Book, a handsome, useful volume of 850

pages. Ask your druggist for Hood's Coupon Calendar, or send 6 cents in stamps for one to C. I. Hood & Co., Lowell, Mass.

Armortite Interior Conduit is now generally recognized by architects and contractors as the standard for all high grade interior work. This conduit as it is now made with the light steel wall and light lining is superior to the old style heavy conduit and is displacing entirely the old type of tubing. The Electric Appliance Company are carrying a large stock of light wall steel Armortite in Chicago and are doing a handsome business on the same. They claim that Armortite is easier to install than any other conduit that has yet been placed on the market.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

The Excelsior Carbon Paper Manufacturing Company, 301 Broadway, New York, in their holiday greeting, issued for distribution, thank their friends for past favors and hope they have merited a continuance of the generous patronage they have received. They desire to call attention to the fact that they have added several special carbons to their already extensive line, and will be pleased to submit samples.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

INCORPORATIONS.

The New York & Staten Island Electric Company has filed with the Secretary of State a certificate of increase of capital stock from \$500,000 to \$1,500,000. The debts and liabilities of the company aggregate \$72,514.

The Marysville Electric Light, Heat & Power Company, Marysville, Perry County, Pa.,—to supply the borough of Marysville with electric light, heat and power. Capital stock, \$10,000. Directors: John A. Herman of Harrisburg, Harry M. Hoover and J. W. Beers of Marysville.

The Kerrville Electric Light, Heat & Power Company, Kerrville, Kerr County, Tex.,—to manufacture and supply electric light, heat and power to citizens of Kerrville. Incorporators: Charles Schreiner, A. C. Schreiner and L. A. Schreiner.

The Jordan River Electric Generating Company's stockholders have voted to increase the capital stock to \$1,000,000 and change the name to the Salt Lake City Water & Electric Power Company. The company is sponsor for the plan to establish a power plant in the Jordan narrows and furnish power for Mercur and Bingham, Utah. Allan G. Lamson is president and C. W. L. Stevens secretary of the company.

The Hudson River & Long Island Sound Railway Company, New York City—to construct a street surface road in Westchester County, N. Y., from Yonkers to Pelham Manor. Capital stock, \$100,000. Directors: Charles O. Bissett, of Washington; Henry A. Welch, of Detroit; James F. Secor, Jr. of Pelham Manor; D. B. Halstead, Paul Gorham and John H. Sed, of Brooklyn, N. Y.; Seward Baker and Walter R. Quick, of New York City, and William L. Stout, of Elizabeth, N. J.

The A. D. Scott Manufacturing Company, Chicago—to manufacture electrical goods. Capital stock, \$25,000. Incorporators: Ashley D. Scott, Samuel S. Scott, Watson B. Farr, all of St. Louis, Mo.

The West Orange Electric Light & Power Company, West Orange, N. J. Capital stock, \$10,000, and \$1,000 is to be used to begin business with. Incorporators: Frank Brewer and Albert P. Condit of West Orange, John O'Rourke of Orange, Jay Ten Eyck of Newark, Alfred P. Skinner of Franklin, and James C. O'Brien of South Orange.

The Manhattan Electric Company, St. Louis, Mo. Capital stock, \$1,000. Incorporators: Elliott Jones, A. E. Bochenstein and G. J. Percival.

The Viking Bicycle & Electric Motor Company, Toledo, O.—to continue the manufacture and sale of bicycles now carried on by the Union Manufacturing Company and in addition take up the manufacture and sale of electric motors and horseless carriages. Capital stock, \$100,000. Incorporators: Alvin Peter, George W. Birchall, Fred Cranston, Arthur J. Cone and Guy W. Kinney.

The Rochester Electrical Manufacturing Company, Rochester, N. Y.,—to manufacture electrical devices, inventions, appliances and attachments. Capital stock, \$50,000. Directors: J. Miller Kelly, Louis W. Miller and William E. Werner, Rochester.

The Colonial Electric Company, New York—to furnish light and power by means of electricity in Greater New York. Capital stock, \$25,000. Directors: Garrett S. Odell and Orin H. Cheney, New York, and Horace S. Andrews, Brooklyn.

The Saranac Lake Light, Heat & Power Company of Franklin and Essex Counties, N. Y.—to acquire the franchises of the Saranac Lake Electric Light Company. Capital stock, \$100,000. Directors: Frederick A. Isham and Charles S. Stackpole, New York City; Orlando Blood, Wallace Murray and Percy A. Gould, Saranac Lake,

A Highly Successful Independent Telephone Company.

A special dispatch in the Detroit Journal from Ishpeming, Mich., dated December 28, conveys information that will not fail to please all friends of independent telephone enterprises. It is as follows:

"The Marquette County Telephone Company, with headquarters in this city [Ishpeming], announces a dividend of ten per cent. to be paid the first of the year. This has been accomplished within two years. The original cost has been exceeded by one-half, due to the increased business secured, requiring a far greater number of telephones than was at first thought could be rented. The total investment is now something like \$35,000, and stock that was issued at \$100 per share is now worth \$135 per share. There are few sellers at this price. The system is one of the best in the country. Nearly 800 'phones are now in use in the county and the business of the Bell company has been practically captured in all of the towns with the exception of Marquette, where, by giving 'phones free and other concessions, it has managed to retain between 200 and 300 subscribers. In the city of Ishpeming, the most populous and prosperous in the county, there are but three Bell 'phones, and these are being furnished rent free. The Marquette Company has paid for all its equipment, and begins the new year without owing a dollar."

The construction of the transcontinental telegraph line in Africa, which began at Blantyre in 1896, had at last reports reached a point 85 miles beyond Fort Johnson, at the southern end of Lake Nyassa. There are at present seven white men working on the construction, in addition to two survey parties. One of these has just completed the survey to Kotakota, and the other has commenced from Bandawe. Another party of six white men has commenced to work from Karonga toward Tanganika, and arrangements have been made to complete the line along the west side of Lake Tanganika, and across to Uganda. The magnitude of this operation will be appreciated when it is pointed out that a hundred tons of material is required for only 150 miles of line, and every thing has to be transported across the country in primitive fashion.

The Onancock Telephone Company has been organized at Onancock, Va., with the following officers: E. E. Miles, president; Dr. John W. Kellam, vice-president; John W. Rogers, secretary and treasurer. The directors are E. E. Miles, John W. Kellam, W. A. Burton, Spencer F. Rogers, Julius J. Belote, Charles F. Rogers, H. R. Boggs, and John W. Rogers. The line will connect Onancock with a number of villages on the seaside and bay. The old line connects Onancock with Accomac Courthouse, from which the recently organized Hall Telephone Company will run a line through the northern part of Accomac, connecting all the towns and villages in that region.

The telephone line connecting Leighton, twelve miles east of Tusculumbia, Ala., with Florence, Sheffield and Tusculumbia has been completed and is now in operation. It is thought that it will not be a great while until Riverton, Dickson, Cherokee, Borton and Pride will also be connected by a line reaching from Riverton to Tusculumbia, a distance of about thirty miles, when all of the principal towns in the county will be connected with Tusculumbia and Sheffield.

A Baltimore dispatch states that on the 6th inst. successful telephonic communication under water was established between Simon Lake's submarine boat Argonaut and points in Baltimore and Washington. Everything worked admirably. The vessel was run out into the Patapsco river with about 1,200 feet of cable attached. While she was under water those aboard were in direct communication with Washington, the Mayor's office in Baltimore and several other points. With the arrangement now on board the boat could go into any harbor or within reasonable distance of any telephone line and form a connection with the central system.

At Atlanta, Ga., the board of electrical control has passed favorably upon the plans for the underground work of the Standard Telephone Company. With these plans approved the Standard people say the work of laying conduits will commence at once. Some work has already been begun. The new company is bound by its contract to put in 1,000 telephones ninety days from the time work is commenced. President Baer says this will easily be done, and he says he will soon have 4,000 'phones operating in Atlanta.

A special cable dispatch to the N. Y. Sun from Berlin, Ger., states that the annual charge of \$37.50 for telephone service in that city will in future be replaced by a yearly rent of \$12.50 for the apparatus plus the small charge of one pfennig (about one fourth of a cent) for each conversation by private persons, two pfennige for business men and

firms and three for clubs, cafes, etc. Business men are strenuously opposed to the proposal that they be charged more than any others.

The Northwestern Telephone Company has notified the State Treasurer of Minnesota that it will not pay the 3 cent tax on business passing to or from the State through other States, because it is interstate business. The company returns the first report on the business done in the State which State Treasurer Koerner at one time rejected. The report gives the business done in Minnesota by the company at \$334,000.

A snowstorm of unusual violence visited Pittsburg, Pa., on the last night of the old year. The principal sufferers were the telegraph and telephone companies, whose lines were prostrated in nearly all parts of the city and in the outlying country. The Central District & Printing Telegraph Company's damages by the storm are estimated at \$80,000.

The Home Telephone Company had another setback at the last meeting of the board of aldermen in New Brunswick, N. J. A motion to refer its application for a franchise to the street and railroad committee was adopted by a vote of ten to three. This delays action for a month at least, with the probability of shutting out the Home Company entirely.

A press dispatch from Freehold, N. J., states that a new telephone line in opposition to the Bell system is in course of erection throughout Monmouth County. The circuit, when completed, will take in Keyport, Red Bank, Freehold, Matawan, Holmdel, Middletown, Atlantic Highlands and intermediate places. The rates will be only about one-half those charged by the Bell company.

A Cheyenne, Wyo., dispatch of the 29th ult. states that the Uintah-Rich Telephone Company has filed articles of incorporation with the Secretary of State, with a capital stock of \$5,000. The line is to be built between Evanston, Wyo., and Randolph, Utah. The incorporators are Chas. Kingston, J. E. Cashin, Charles Stone of Evanston, Robt. McKinnie of Randolph, Utah, and J. M. Baxter of Woodruff, Utah.

Richmond, Va., by connecting with the exchange in Manchester, just across the river, is enabled to use the long distance telephone and thus communicate with all the great commercial cities of the country. The long-distance telephone company has been unable to get a franchise in Richmond.

The Clay County Telephone Company at its annual meeting at Clay Center, Neb., recently, declared an annual dividend of 10 per cent. The following officers were elected: President, L. C. Hurd, Harvard; vice-president, C. J. Furer, Fairfield; secretary-treasurer, J. F. Eller, Harvard.

Harry Inks of Ligonier and B. F. Leiser of Albion have been granted a franchise by the Commissioners of Noble county, Ind., to construct a telephone line connecting Kendallville, Brimfield, Rome City, Avilla, Ligonier, Wawaka, Kimmel, Cromwell and Albion.

The Norristown, Pa., Times says the Phoenixville Telegraph & Telephone Company will change its name to the Chester County Telegraph & Telephone Company and will operate in Montgomery, Chester and Delaware counties, Pa.

Among recent visitors to Chattanooga, Tenn., according to the "Times," was O. Rex, of North Manchester, whose mission was to organize a new telephone company and operate a new telephone system in Chattanooga.

A telephone line is to be erected between DeLand and DeLeon Springs, Florida.

New Companies Incorporated.

The Business Men's Telephone Company of Nunda, Livingston County, N. Y. Capital stock, \$5,000. Directors: L. A. Walker, Nunda; H. C. Farnum, Oakland; Robert Bennett, Short Tract; V. E. White, Granger; George Campbell, East Koy; John Myer, Lamont, and S. G. Clute, East Koy.

The Nicholasville Telephone Company, Nicholasville, Ky. Capital stock, \$10,000. Incorporators: H. B. Lancaster and others.

The Baltimore, Annapolis & Drum Point Telephone Company, Baltimore. Capital stock, \$12,500. Incorporators: George Weems, William and Frank R. Biedler, John B. Gray, William H. Hellen and others.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 10½@10¾c.; Lake, 10½@11c.; cast, 10½@10¾c.

The North Chicago Street Railway's quarterly dividend of 3 per cent. will be payable January 15.

The Green & Coates Street Passenger Railway, Philadelphia, announced a dividend of \$1.50 per share, payable January 7.

The Citizens' Street Railroad (Indianapolis) earned gross in December \$87,650, an increase of \$10,272 compared with December, 1896.

The Columbus (O.) Street Railway reports for December gross earnings of \$55,495, an increase of \$3,385, and net earnings \$30,481, an increase of \$4,330.

The Chicago Edison Company has made an additional issue of \$400,000 five per cent. first mortgage bonds, making the total amount now outstanding \$2,975,000.

A bill has been introduced in the Ohio Legislature providing for the repeal of the law granting permission to cities to extend street railway franchises fifty years.

The Hestonville, Mantua & Fairmount Passenger Railroad Company (Philadelphia) declared a semi-annual dividend of 3 per cent. on its preferred stock, payable January 10.

The United Traction Company of Pittsburg reports for December, 1897: Gross earnings, \$127,594; operating expenses, \$54,856; net earnings, \$72,648; fixed charges, taxes, etc., \$47,657; surplus, \$24,991.

A dispatch from Columbus, O., states that a mandamus would be brought in the Supreme Court to compel county auditors over the State to list Bell Telephone Company for taxation to full earning capacity.

Judge O'Rourke, in accepting the withdrawal of M. S. Robison as receiver of the Fort Wayne Consolidated Street Railway, and his final report, allowed him but \$6,667 for his services instead of the \$20,000 he demanded.

Foreclosure proceedings have been begun against the Brooklyn & Brighton Beach Railroad Company in the New York Supreme Court by the Central Trust Company of New York, which holds, as trustee, \$500,000 first mortgage bonds on the property.

In order to complete the many improvements contemplated by the Allegheny (Pa.) County Light Company, the capital stock will be increased. At present the stock is \$1,500,000, and it is expected to increase it to \$2,500,000. A meeting for that purpose will be held March 2.

At the annual meeting of the New Orleans Traction Company, held last week, Mr. Seligman, R. M. Walmsley, of New Orleans, and St. John Boyle, of Louisville, were appointed a committee to arrange for a reduction of operating expenses and to effect other economies. Operating expenses amount to over 74 per cent. The old officers were re-elected.

The earnings of the Central Union Telephone Company in 1897 (December estimated) were \$340,787, or more than double the amount needed to cover the interest charge on the entire issue of bonds, including the \$1,200,000 six per cent. first mortgage gold bonds recently issued.

The Boston "News Bureau" of the 10th inst. says: "The Cataract General Electric Company will to-day pass upon plans to install electric towing on the Champlain canal. Since Platt, Hawley & Co. secured the canal electric franchise free from the State its value has increased to \$16,000,000, though no work has been done."

The Akron, Bedford & Cleveland electric line will pay its first dividend January 15. The amount to be paid is 1 per cent. of the capital stock, or \$7,500. The road has been running only two years and to pay a dividend in that time, financiers say, is remarkable. In addition to paying this dividend the road contemplates spending considerable money in improvements along the line.

On the 7th inst. the directors of the Boston Elevated Railroad Co. met for organization and elected the following officers: William A. Gaston, president; William A. Bancroft, vice-president; William Hooper, treasurer; John T. Burnett, secretary and clerk. The executive committee elected were: William A. Gaston, William A. Bancroft, T. Jefferson Coolidge, Jr., James M. Prendergast and Robert Winsor.

The Chicago "Inter Ocean" says the acquisition of the Commonwealth Electric franchise by the Chicago Edison Company "is regarded as a bit of valuable business and along the lines which have characterized the course of the management in endeavoring to secure legitimate control of the electric lighting business in Chicago north of 39th street. A part of this policy has been to make reductions in price and avoid inviting new competition. The Commonwealth franchise is a very sweeping one, giving its owners the right to manufacture and distribute electricity 'for the purpose of furnishing light, heat and power and the transmission of sounds and signals' in all parts of the city."

The Marquette "Mining Journal" says: "Many experiments have been made by chemists in the hope of discovering some process giving greater tensile strength to electrolytic copper, but so far the results obtained have been of a negative character. An experiment of this kind was made at Dollar Bay about a year ago, when several carloads of Montana copper were received at the plant of the Tamarack Osceola Company. Every effort was made to secure good results from the western copper in its course through the wire drawer mandrels, but unsuccessfully, there being the usual difficulties met with because of the lack of cohesiveness, a marked characteristic of Lake copper, but which is lacking in the metal when secured by its precipitation through the use of the electric current. Further tests have since been made but the results so far secured are not encouraging."

The following appeared in the financial columns of the "Sun" yesterday: "Kessler & Co. offer at par \$250,000 of the 8 per cent. preferred stock of the Electric Vehicle Company. The authorized capital stock of the company consists of \$5,000,000 preferred stock and an equal amount of common. Of the preferred stock only \$60,000 have already been issued. The proceeds of the present offering, which is underwritten by a syndicate, is to be expended for expanding the company's plant, and no part of it for patents or franchises. The earnings of the company in excess of 8 per cent. upon the preferred stock and the same upon the common are to be divided between the two classes outstanding, pro rata. One share of full paid, non-assessable common stock will, under the terms of the present offering, be given to each subscriber to a share of the preferred stock."

The Brooklyn "Eagle" states that holders of Kings County Traction Company stock have received the following communication from J. & W. Seligman & Co.: "Notice to stockholders Kings County Traction Company: We have sold, in connection with other large shareholders, more than a majority of the stock of the Kings County Traction Company at the price of \$47 per share, and have made it a condition of the sale that the minority stockholders be given the right to dispose of their stock at the same price. Shareholders desiring to avail themselves of the option may, by presenting their certificates to the Guaranty Trust Company of New York, corner of Nassau and Cedar streets, receive cash for the same at the above named price of \$47 per share. The right to sell under the option will expire January 14, 1898." The "Eagle" adds: "There are so far as is known no stockholders who are complying with this notice and among the minority holders there is considerable indignation that their interests have not been better protected. There will of course be opposition to the reorganization plan on the part of these stockholders, and it is reported that already papers are being drawn up looking to the appointment of a receiver to secure for the minority at least as good terms as the majority stockholders have secured."

EDITORIAL NOTES.

Electricity for the Elevated Roads.

It is now generally conceded that electricity will supersede steam on the elevated railways in New York City. After several years of discussion, drawing of plans and spending of money, the underground rapid transit scheme would seem to be dying. In view of this fact it is an exceedingly wise step the directors of the Manhattan Elevated Railway Company have taken in deciding to equip its lines with electricity. The system that will unquestionably be adopted is that generally known as the third-rail, similar to the method now in operation both on the Chicago elevated railways and on the Brooklyn Bridge. This third-rail system is economical of construction and has given so far fairly good results wherever it has been tried. Its principal objection would seem to be that the rail is constantly charged, and when located on land open to the public might lead to accidents. In the case of the Elevated system, however, this objection scarcely holds good, as the structure is not open to the public.

Our contemporary, the *Electrical World*, in a recent editorial apparently took an extremely optimistic view of the possibility of some such system superseding steam for suburban traffic. The editorial we refer to was a mild criticism of an article which appeared in the same issue of that paper on the difficulties of heavy electric railroading, by Dr. Louis Bell.

An elevated railroad equipped with electricity furnishes in reality nothing more than a trolley service on a large scale, and a suburban road in order to be operated successfully and economically by electricity would have to adopt this same service or run trains at exceedingly short intervals. As Dr. Bell aptly states in his article, there would be great danger of a suburban road equipped with electricity breaking down at some inopportune moment and delaying traffic for four or five hours, or possibly longer. The chances of such an occurrence happening could of course be reduced to a minimum by having all the apparatus in duplicate, but this would entail an immense outlay of money and not entirely do away with the possibility of such a mishap taking place.

As regards the danger attending the use of the third rail, a method has recently been patented which it is claimed will eliminate the objectionable feature attending the use of this system by making the conducting rail dead after the passing of a train. This is accomplished, so we understand, by having the top of the rail movable. A shoe on the car would touch the rail, move the top along a short distance until it became alive, and then take elec-

tricity from it. After the shoe has passed over the section the top of the rail returns to its normal position, which is accomplished by means of a spring, and the electrical connection is broken. For lines operating in the open, as for instance the electrically equipped section of the New York, New Haven and Hartford Railroad, this device if practicable should be of inestimable value and would do away with the trouble which attends the use of the present third-rail system, especially at highway crossings. Where there are movable parts in a system there is always a chance of their getting out of order, and experience has shown that reliance cannot be always placed on the action of springs; for this reason it would be well that the above system should undergo a thorough test before being adopted anywhere on a large scale.

Presuming the third-rail system is adopted by the Manhattan Elevated Railroad, there are a number of methods by which the trains may be propelled. They can either be drawn by separate locomotives or arranged on the Sprague unit system, which is in operation on one of the roads in Chicago, or have electric motors placed on each car. In all probability a modification of the latter method will be adopted, and in place of the steam locomotives an equal number of motor cars will be used. These electric car locomotives, as they might be termed, will then be employed to draw one or more ordinary coaches.

It is claimed that by the use of electric motors the time consumed in making a round trip will be greatly reduced and thus a species of rapid transit will be secured. In any case the change when made will certainly be for the better as far as the public is concerned. The people living along the lines of these railways would no longer be obliged to keep the windows closed in summer to prevent the admission of steam, smoke and gases which are constantly given off by the engines now in use. The necessary power to operate these systems will in all probability be generated at various points along the river front where coal can be delivered economically. One important point seems to have been overlooked regarding the equipping of the elevated roads with electricity, namely, the possibility of electrolysis. If the Brooklyn Bridge is in danger of being destroyed by electrolytic action, as several newspapers would have us believe, there would seem to be no reason why the elevated structure should not likewise be affected. Were this action to take place, the supporting pillars would probably be greatly weakened. This would be a very serious matter, as the structure as it stands will be none too strong for the number of trains and the load it will have to carry. When these roads were first constructed, the traffic was comparatively light and trains consisted of only a few cars. As it became necessary to afford greater accommodation more cars were added, trains were run at shorter intervals, and in several places a third

track was laid for the use of express trains. Now still greater speed is desired, and it is thought this can be obtained by adopting electricity. The traffic will certainly not diminish, but on the contrary should greatly increase. This means that the structures will come very near being overloaded unless proper precautions are taken to strengthen them. When this system was built, some twenty years ago, undoubtedly a suitable factor of safety was allowed. It might be exceedingly interesting to ascertain what this factor of safety is at the present time. This is too important a point to be overlooked, and now that better methods are shortly to be adopted it would seem to be an extremely opportune moment for the management of the road to have any weak points in the structures suitably strengthened.

As yet it is impossible to say who will get the contract for providing and installing the electrical apparatus. From all accounts the Walker Company would seem to stand an excellent show, but the probabilities are that the contract will be divided. We trust Mr. Gould's recent statement in the *New York Sun*, to the effect that a change of motive power would be made with as little delay as possible, actually means that work will shortly be begun. There has been enough talk about rapid transit and contemplated improvements without anything having been accomplished; what the people now want is to actually see the work begun.

* * *

S. Dana Greene's Paper.

The paper recently read before the New York Electrical Society by Mr. S. Dana Greene, entitled "The Relation Between the Customer, Consulting Engineer and the Electrical Manufacturer," and to which we give space in this issue, is exceedingly clear, concise and very timely. Mr. Greene opens this paper by giving a short sketch of the electrical industry between 1887 and 1892, when electric railway plants were springing up all over the country and consulting engineers were few and far between. The installations at this early period left necessarily much to be desired, as technically educated electrical engineers were scarce. The author of this paper aptly calls attention to the fact that a large portion of the profits of the business both of the operating and manufacturing companies was spent at the close of this early period in rectifying defects. With regard to the consulting engineer, Mr. Greene acknowledges that he is a necessity and a proper connecting link between the manufacturer and customer. His function, without a doubt, is to see that his client who buys apparatus and installs it selects that which is best suited to the local conditions. It is to be deplored that the majority of consulting engineers at the present day, more especially those who have recently commenced practice, as Mr. Greene states, decline to be brought more closely in contact with the manufacturers with a view to ascertaining what the latter can reasonably be called upon to make. This lack of knowledge of what the various manufacturers can turn out without having to make new patterns, special tools, dies, etc., frequently entails extra expense to the customer and annoyance to all parties concerned. The advantage of specifying standard apparatus lies in the fact that if any part of a machine ultimately proves defective or wears out it can quickly be replaced at a comparatively slight cost to the purchaser.

With the special apparatus, which is now unfortunately being more and more frequently called for, when any part has to be renewed it entails a useless expense and generally delay.

The point in this paper regarding the length of specifications now furnished by consulting engineers in general is well taken. At the present stage of the art any first-class manufacturer is thoroughly capable of turning out good apparatus without the consulting engineer having to specify exactly how it

shall be made. This portion of the work should be left to the judgment of the manufacturers, who would then naturally be held responsible for the satisfactory running of apparatus after completion.

Let a consulting engineer confine himself to calling for the most suitable system to meet the case and specifying what tests the various machines shall be put through, and leave it to the maker to see that the machinery is capable of standing such tests.

We trust the younger element of consulting engineers now practising do not intend to seclude themselves as some of the architects in this city have done and continue to do. Mr. Greene's paper would rather lead us to believe there is a tendency in this direction. We refer to the way some architects have of hiding themselves from callers in an inner sanctum sanctorum, protected by youths scarcely out of the nursery, who hold all callers at bay from behind a barricade consisting either of a table or a partition in which there is a pigeon-hole window, and through which the visitor has to pass a written statement of his business before gaining admission. Verily it would appear harder to reach the presence of a large number of our architects and a few electrical engineers than for a camel to pass through the eye of an needle.

Mr. Greene's paper is a forcible presentation of his views, and there are many points well taken. Any action towards bringing the manufacturer, consulting engineer and customer more closely together will certainly be welcomed by the electrical industry in general.

* * *

A Wonderful Electric Gun.

An electric gun is now being patented by John H. Hartman, a veteran of the Civil War, which, provided it accomplishes what seems to be expected of it by the inventor, should go far towards revolutionizing modern warfare. This new weapon is designed to discharge a current of electricity at any desired voltage, the transmitting path or circuit consisting of the rays from a powerful searchlight. The principle upon which the invention is based, according to Mr. Hartman, is that under certain conditions the light waves will carry the current, and those upon whom the light is turned will receive a shock as though they had come in contact with a live wire. He moreover claims to be able to shoot an electric current as far as a searchlight will throw the rays. In support of his theory he points to the fact of having tried such an experiment on a rabbit with a fifty-volt alternating current which almost resulted in the death of the animal.

In a recent issue of the *New York Press*, Mr. Hartman is credited with having made the following statement:

"My gun is being built in Bridgeport. It will be ready in the spring for a test. The gun will stand on a tripod and can swing in any direction. A button pushed sets it in operation. The current I expect to use will be the highest alternating current obtainable; the higher the more deadly and the further it will carry. A man operating this gun can swing it to the right or left and everything it strikes will go down. It can be focused and sighted the same as any gun. Its use, of course, will be limited, as it has to be connected with powerful dynamos. But when thus connected it cannot be compared with anything now in use. A stream of water will carry a current of electricity, but you cannot shoot it far enough to make it effective. The light rays will carry it an immense distance. The Government will give me a trial, I am certain. They are now using an invention of mine, the Hartman carbine socket. They have been using it since 1880."

It is to be regretted that the inventor of this new implement of warfare fails to state what the certain conditions are that make the rays of a searchlight a good conductor. Rays of light necessarily pass through the air, and as the latter in a dry state is one of the best dielectrics known, it is rather difficult

to see how such an apparatus can accomplish what is claimed for it.

The inventor states that experiments will be made in the near future on a comparatively large scale with the gun which is now being constructed, and the result of these tests, if ever made public, will undoubtedly be of interest to the electrical fraternity.

The New York Electrical Society and the Electrical Exhibition.

With a view to enlarging its scope of usefulness, the New York Electrical Society, the oldest electrical body in the country, has decided to co-operate with the Electrical Exhibition Company, which will hold its next Exhibition in Madison Square Garden in May of the present year. At its recent meeting the New York Electrical Society passed the following resolution:

"Resolved, That having heard the report of the officers of the Society in regard to the arrangement effected for co-operation with the approaching Electrical Exhibition in the city, the members hereby express their hearty approval and pledge themselves to active work that shall make the most of this opportunity for promoting the interests of electricity and the welfare of the Society."

The hearty co-operation of such a distinguished body as the New York Electrical Society should go far towards making the coming Exhibition even more successful and popular than that of 1896. The coming together of these two organizations will unquestionably be to their mutual advantage, and assures beforehand the complete success of the Exhibition. The latter deserves to be highly commended for the courtesies it has extended to the Society in placing a booth at its disposal as a rendezvous, and agreeing to turn over to it a percentage of the admission receipts for educational work. Under the auspices of the New York Electrical Society the Madison Square Garden Exhibition cannot help but be a far greater success than any that has been given heretofore.

Under the Searchlight.

Notes and Comments on Various Topics.

Is it Believed?

(From the Boston News Bureau.)

Matters in respect to General Electric preferred stock are approaching a solution and it is believed that before July 1 next stockholders will receive a proposition from the company. There is now 31% per cent. or 4% years accumulated dividends on General Electric preferred.

This is apparently the same old story that has been harped on time and again. The stockholders are now given a quasi promise that some proposition will be made them by July next. Some months ago the investors' spirits were kept up by vague intimations that some kind of a settlement of unpaid dividends would probably be made by February. Now comes a rumor that something will surely be done by July. When July comes it will probably be February, 1899, when matters will be straightened out; and thus time passes, the stockholders are kept on the anxious seat and the unpaid dividends continue to accumulate. The stockholders in the General Electric Company must surely be an amiable and patient set of people.

REGARDING a scheme of the incandescent lamp combination to drive all the independent manufacturers of similar products out of business, which appeared in our issue of December 29, our representative recently visited the office of the Royal Incandescent Lamp Company in Cleveland, which he found located at 7 Water street, with a view to obtaining a little general information. Each time he called he was informed that the party who gave information was out, so as a last resource Mr. Charles

Rockwell was interviewed. This gentleman made the statement that the company was asking no credit and was paying cash for everything. This would seem plausible, as the total visible property of the concern apparently consists in a desk and a few chairs, although it may possibly be that the company is not as yet in shape for business. If the object of this organization is to supply lamps manufactured by the various concerns in the Pool, a large outlay of capital would naturally be wholly unnecessary.

* * *

AN electrically illuminated keyhole promises to be as common, so it is claimed, as the ordinary push-button door-bell. A Denver man has invented this device, which consists of a small incandescent electric lamp located inside the lock and a push-button projecting through the casing. On pushing the button the lamp is lighted and throws a brilliant stream of luminous rays through the keyhole. On throwing back the bolt with the key the lamp is automatically put out. The inventor's idea probably was that such a device would be of inestimable value to belated clubmen, but if such is the case he had better re-design his apparatus and make it automatic from beginning to end. Is it reasonable to suppose that a clubman who was kept out late "sitting up with a sick friend" could ever find the push-button to start the light in the first place?

* * *

A FLOATING newspaper paragraph states that the Westinghouse Company has secured the contract for lighting some half dozen catacombs in Rome by electricity.

"Some months ago," the paragraph informs us, "the subterranean burial ground of St. Callistus was lighted, and the effect was so satisfactory that the persons in charge decided to have electricity put in all the catacombs of the city. Six motors capable of supplying current for no less than 450 lamps will be placed in the six catacombs."

The Westinghouse Company must have experienced some difficulty in securing those "good European contracts" when its representatives were forced to nose around the noisome Roman catacombs for a job. Mr. Coffin's representatives would never have thought of such a thing.

* * *

I wish to protest against the many articles appearing in the sensational papers of New York from time to time purporting to be interviews with me about wonderful inventions and discoveries made or to be made by myself. Scarcely a single one is authentic, and the statements purporting to be made by me are the inventions of the reporter—the public are led from these articles to draw conclusions just the opposite of the facts. I have never made it a practice to work on any line not purely practical and useful, and I especially desire it to be known, if you will permit me, that I have nothing to do with an article advertised to appear in one of the papers about Mars.

THOMAS A. EDISON.

That the above card should appear in the New York World is little short of laughable, when it is recalled how frequently this sensational paper comes out with startling discoveries and tales of wonderful inventions. Mr. Thomas A. Edison is in the right in objecting to the promiscuous use of his name attached to sensational articles; and if Mr. Tesla could only be induced to follow the example set him, some of our dailies would be pretty badly off for sensational scientific matter.

The Electric Railways of Canada.

There are 569 miles of electric railways in Canada, exclusive of those in British Columbia. Statistics show that the train mileage run in 1896 was 22,917,151, and the number of passengers carried was 73,496,069. The total capital and bonded debt was £4,600,000. There were in use 947 motor cars, with 1,315 motors, 380 trailers, and 62 street sweepers and snow-ploughs, while the total number of hands employed was about 3,400.

A Trial Accumulator Car.

A new accumulator car, says the *Elektrotechnischer Anzeiger*, was exhibited to a party of engineers and pressmen on one of the Berlin steam-tramway lines on December 18th last. It is a four-wheeled car built and equipped by Messrs. Kummer & Co., of Dresden, the accumulators being of the Ribbe type. The car is provided with 20 seats and standing room for 11 passengers, not including the driver and conductor; it weighs empty, but with its battery, 10 tons, and it is driven by a single 30 H. P. series motor. The speed regulation is effected by means of a water resistance and by series-parallel arrangements of the cells. Forty-four boxes, each containing three cells, are placed under the seats, each box measuring 7½ in. by 5½ in. by 12 in. high, and weighing complete about 170 lbs., the whole battery weighing, therefore, about 67 cwt. The boxes are sealed with covers and rubber packing, and there

and the latter is retained in contact with the grid by perforated celluloid plates 0.02 in. thick. The celluloid strips referred to hold these celluloid plates in position. The negative plates are also provided with separating pieces of celluloid $\frac{3}{8}$ in. high. It is stated that the celluloid contains but a very small percentage of sulphur, so that it does not act in any way on the lead grid, and it is said to have lasted for nearly three years in some cells made by a Paris firm.—*The Electrician, London.*

Manganese Dioxide in Lead Accumulators.

Mr. G. von Kuorre, in the *Zeitschrift für Elektrochemie*, gives some interesting facts relating to experiments carried out by him with regard to the use of manganese in accumulators. He states that a freshly-charged positive plate, dipped into sulphuric acid containing manganese sulphate, at once gave the pink color and the absorption spectrum of perman-

"TOM, DON'T YOU THINK YOUR HEAD IS LARGE?"

Reproduced from the New York Evening Telegram.

are tubes to lead off the gas. The cells themselves, which are said to be made of celluloid, each contain seven positive and eight negative plates, measuring 12 in. by 7½ in. by $\frac{3}{4}$ in. thick, with the exception of the two outside plates, whose thickness is only $\frac{3}{8}$ in., the weight of the plates being 2.5 and 1.8 lbs. respectively.

From figures supplied by the makers the cells can be discharged in 5½ hours, with a current density of 0.045 ampere per sq. in.; this corresponds to a current of 55.3 amperes and a capacity of 304 ampere hours, or about 8½ amperes per lb. of plate. The normal current is, however, only 35 amperes, and the battery is intended for a whole day's work of 16 hours without being re-charged. The grid consists of a lead frame 0.14 in. thick, with a perforated partition 0.04 in. thick. On each side of this partition narrow strips of thin celluloid are fastened by means of celluloid solution, then comes the active material

ganate. The same acid is formed when a positive plate on which some manganese dioxide is spread is immersed in sulphuric acid. On the other hand, a permanganate solution is discolored by a negative plate, and a lead glycerate plate containing manganese dioxide and coupled as cathode with another plate during formation soon made the anode red, although the sulphuric acid and the anode were free of manganese. The author concludes that there is little doubt but that the manganese acts as oxygen carrier from the positive over to the negative plate, and impairs the capacity of the cell; and that the fact that we do not notice the color reaction in ordinary cells is due to the circumstances that the oxidation and reduction proceed simultaneously. An accumulator which has been prepared with manganese salts is said to become quickly discharged. The author strongly advises that manganese compounds should be avoided in electric accumulators,

THE RELATIONS BETWEEN THE CUSTOMER, CONSULTING ENGINEER AND THE ELECTRICAL MANUFACTURER.*

BY S. DANA GREENE.

The subject which I have chosen for this paper is an eminently practical one, and I shall endeavor in my remarks to call attention to certain causes of friction which at present exist between the parties in interest, and to suggest certain remedies which may serve to bring about a better understanding and to lessen this friction, which is, in my opinion, entirely unnecessary.

In order to discuss intelligently present conditions it is advisable to trace briefly the development of the electrical business, and to do this one need hardly go back more than a dozen years. At that time electric lighting was still an experiment (from the commercial standpoint), electric railroading had not begun, and electric power transmission was discussed as one of the possibilities of the future. Very few of our institutions of learning had established separate electrical courses, and such a thing as a consulting electrical engineer hardly existed in this country. The few men who had some theoretical knowledge were eagerly caught up by the manufacturing companies, who had difficulty to find men capable of solving the many pressing practical problems with which they were confronted when they began to sell electric machinery. Thus the development of a practical generator and incandescent lamp immediately created a demand for suitable conductors and materials for outside and inside wiring, safety devices, etc., as well as close regulating engines, proper station appliances and many other things which are to-day regarded as "standards" in the business. It was less than a dozen years ago that the first fireproof switchboard was installed, in the Broadway Theater, New York. The specifications were drawn by a consulting engineer—a naval officer, by the way—calling for a fireproof structure, and the manufacturer no doubt accepted the order thinking that he could use what had always been used before, viz., a wooden framework. In this he was mistaken, however, and after a year's wrangling a slate board was installed, much to the manufacturer's disgust and at great expense to him. It is hardly necessary to say that this form of switchboard became standard immediately, and several years after, the manufacturer happening to meet the naval officer, said to him: "Someone was a d—d fool about that switchboard, and *you* were not the man." I well remember when I left the Navy to join the Sprague Company in June, 1887, I found that the technical force of the company consisted of Mr. Sprague, an ex-naval officer, and Lieut. Crosby, who had just left the Army. Upon explaining to the former how modest was my store of knowledge on the subject of "electric street railways," he at once assured me by saying that we were all in about the same boat and that there was a fine opportunity to learn. My opportunity came sooner than I expected when, about July 1, I was charged with the execution of a contract for the equipment of a 40-car road in Richmond, Va., which, under the terms of the contract, was to be in full and complete operation on the first of the following October.

Doubtless most of those present to-night can recall the remarkable growth of electric lighting and railway work during the next five years, from 1887 to 1892, a growth that can fairly be called tropical. Plants sprang up in nearly every city and town in the country, and manufacturers sprang up with equal rapidity. There seemed to be unlimited money ready to invest in electrical enterprises, and the anticipated profits were such as to make the old established manufacturing industries seem very poor investments. During this period, which may be called the "forced expansion period," purchasers usually

had to take what they could get, and consulting engineers were few and far between. Specifications for apparatus or installations, when there were any, were generally prepared by the manufacturer, and the purchaser rarely knew whether they had been fulfilled or not. By the close of this period, however, the colleges and technical schools began to turn out men who had taken special courses in electricity and who naturally looked for a chance to make an honest living. The first great demand of the manufacturing companies for technical assistants having been satisfied, many of these young men found their way into local operating companies, or else established themselves as consulting or contracting engineers, in which positions they found plenty of work; for by this time the imperfections in the earlier installations and types of apparatus had become plainly evident to the purchaser as well as to the manufacturer, and there was a general demand for better workmanship and more rigid requirements in installation. It may be here noted that much of the "anticipated profit" of the business, both of the operating and manufacturing companies, was spent subsequently in making good these early defects; and while the business as a whole profited largely by this reconstruction process, it naturally dampened the enthusiasm of the early investors.

In 1895 came the panic, and for the past four years there has been a wonderful record of savings and economies both in electrical manufacturing and operating companies, as well as a great improvement in quality of product. It has been, in fact, the "economic and reconstruction period." The operating companies have learned that they too are manufacturers of a product, electricity; and as these hard times have forced down the price of their product, they, like the manufacturers of apparatus, have had to keep their heads above water and their companies out of receivers' hands by the introduction of more economical and improved methods of manufacture and of administration. During the past year there has been a marked improvement in the electrical business; it is to be hoped that this improvement is permanent, and that the past four years of retrenchment and economy have paved the way for a normal and steady growth on conservative lines—in other words, for a period of "natural expansion." The business to-day is on much the same basis as in other industries where prices are close, competition keen, and where a better article is furnished for less money than ever before.

The manufacturers of apparatus and the manufacturers of current are dependent upon each other to a large extent and their relations should be close and friendly. The consulting engineer, as in other engineering trades, is a necessary and proper connecting link between the two, and I can say frankly that I believe he has a proper and permanent field of usefulness. Broadly speaking, his function is to see that his client who buys apparatus and installs it selects first that system best suited to his particular local conditions, and then, in purchasing, secures the best (not necessarily the *most*) for his money. It is equally the duty of the consulting engineer to learn what the manufacturer can reasonably be called upon to make, to consult with him freely and to obtain the benefit of his experience; to give him credit for work well done and to insist that bad work shall be promptly corrected. Many consulting engineers, especially those who have recently commenced practice, seem to think that it is improper for them to consult with the manufacturer, or to examine his plant, or to ask him for information or advice. Their idea seems to be that by so doing they may be accused of partiality or undue bias, or with lack of proper care for the interests of the purchaser; or they may feel that it is derogatory to their own dignity as engineers. The inevitable result is that specifications often contain provisions which are a sort of annoyance and expense to the manufacturer and purchaser alike, and which have no compensating advantages from either the engi-

neering or commercial standpoint. In fact, some of these provisions are impossible or impracticable of fulfillment, and in such cases the honest manufacturer who wishes to meet the specifications and guarantees required finds himself forced to ask the engineer or the purchaser (sometimes both) to modify them. This is a proceeding which is always difficult and delicate to undertake, and often results in friction and trouble for all concerned. I am satisfied that if every consulting engineer would take advantage of opportunities as they occur to visit manufacturing establishments, see the work there in progress and confer with the engineers, he would find himself well repaid for the visit and his own work and practice benefited thereby. I am equally satisfied that no reputable manufacturing establishment would refuse admittance, but on the contrary would welcome such visits as beneficial to both parties. The day of mysterious methods of manufacture, carried on behind closed doors, is passed in the electrical business, and I appeal with confidence for an endorsement of the opinions just expressed to those consulting engineers who have already tried the plan suggested. I have said that I thought the engineer would find himself repaid by such visits. I think also that he will find himself in a better position to advise his client intelligently. A purchaser usually knows little or nothing of the relative technical merits of apparatus, and his final decision is governed largely by price and by paper statements and guarantees, which may mean much or little. The consulting engineer who has seen the apparatus in process of manufacture can advise, not only as to whether the various bids comply with the specifications, but also what make or makes of apparatus are, from their design, construction and factory inspection and test, most likely to give the least trouble and expense in continuous service.

Some engineers seem to measure their value to the purchaser by the length of their specifications, and some of these formidable documents strike terror to the heart of a busy man confronted by a deskful of mail. The specifications not only specify what the conditions of service are, what apparatus is required, and what tests shall be applied to it for acceptance, all of which are quite proper, but also *how it shall be built*, which is another matter. The electrical manufacturers of this country, following the admirable precedent which has given American manufactured products (particularly machinery) a world-wide reputation, have endeavored to establish standard lines of apparatus whenever the permanency of type and the size of the demand warrant it. This practice not only tends to reduce cost (and with it price), but also enables the purchaser to secure quickly and at a minimum of expense, duplicate parts which are really duplicates, and which can be fitted without the aid of a skilled mechanic. It is the American system of standard lines of machinery and interchangeability of parts which has stood the test of time and which holds its own against all competitors. This system, however, is possible only where the same article is manufactured in quantity, since the expense of designs, drawings and patterns, special tools, jigs, dies, etc., is prohibitive unless spread over a large production. On the other hand, if special apparatus is required, it means a relatively large expense for these items which cannot be charged to a standard product, and which thus constitute a handicap both to the manufacturer and the purchaser. A machine is "standardized" only after long experience both in manufacture and service, and other manufacturers (the builders of engines, trucks, etc.) as well as the users, are invariably consulted before such standardization. It would appear to be to the interest of both seller and buyer to use such standard machines wherever and whenever possible; and yet it seems to be a fact that the demand for special machines is increasing rather than decreasing as apparatus becomes more generally standardized. To prove this I can cite the experience for the past year of one manufacturing

* Paper read before the New York Electrical Society, Jan. 12, 1898.

company with which I am familiar. During this period the designing engineers were called upon for estimates on special apparatus, as follows:

Direct current: No. of estimates, 300; No. of kw. of apparatus involved, 31,000.

Alternating current: No. of estimates, 300; No. of kw. of apparatus involved, 131,200.

These estimates were all embodied in formal propositions; besides these there were between two and three times as many preliminary estimates required to answer inquiries of customers, which the engineers had to prepare.

This was in addition to their regular work on standard lines of apparatus, of which there are over thirty. Some of this work was undoubtedly due to new developments in the business and to new methods and inventions, a condition which, although unfortunate from the manufacturing standpoint, must exist for many years to come; but a great deal of it was also due to the fact that specifications call for special apparatus, or methods of construction, where standard apparatus and methods would do equally well. This experience I find is common among electrical manufacturers, and I attribute it largely to lack of touch between the manufacturer and the engineer drawing the specifications, whether he be regularly employed by the purchaser or retained in an advisory capacity. Let the engineer see more of the manufacturer and his work, and let him hold the latter responsible for results as determined by proper tests, leaving the details of construction where they belong, in the manufacturer's hands.

This brings us to another phase of the subject, viz., the tests and guarantees prescribed by specifications. Omitting from consideration matters which, as already stated, belong properly to the designer and builder, such as current densities in the windings or in brushes, methods of insulation, kinds of material, etc., etc., the tests necessary to determine a machine's quality (and hence its value to the purchaser) are few in number and can be enumerated under the headings of *efficiency*, *heating*, *regulation*, *sparking* and *insulation*. If the requirements under these five headings were formulated under some general rules, and if the methods of tests to determine results were uniform, the work of the consulting engineer and the manufacturer would be vastly lessened. Such unfortunately is not the case, and specifications on these points vary widely both as to requirement and as to the method of test. It seems practically impossible for the various manufacturers and consulting engineers to standardize these requirements and tests by any concerted action, and the only other solution of the difficulty is for some scientific, non-partisan organization to undertake the work. The American Institute of Electrical Engineers is just such a body, and it would render a great service to the entire electrical business if it would consider the matter. Without attempting in any way to suggest what action it should take, it seems proper to call attention to some of the points which most frequently give rise to misunderstandings and disputes.

1. *Efficiency*.—The proper distinction between electrical and commercial efficiency is not made. The latter is what interests the purchaser, and it should always be specified. A clear statement of what losses must be included to determine it, and also a general statement of what constitute reasonable and proper commercial efficiencies in well designed machines, would be of great service. Such a statement should show the necessary difference between carbon and copper brushes, and between the voltages most commonly used in direct current work, viz., 125, 250 and 500 volts, as well as between machines of various sizes. The formulation of such information on alternators is more difficult, but all manufacturers have certain standard lines of these machines and it is quite possible to make some intelligent general rules.

Electrical manufacturers are sometimes required

to guarantee the combined efficiency of generator and engine (or other prime mover). This is clearly unfair and shifts the direct responsibility of guarantee from the maker of the prime mover, where it properly belongs.

2. *Heating*.—For all ordinary conditions of service, the safe heating limits for continuous full load operation can be determined with a fair degree of accuracy. The commutator heats more than any other part of the machine, particularly with carbon brushes, a fact which is often ignored. Sometimes the heating is measured by thermometer, sometimes by increase in resistance. There should be one uniform method followed. Overload guarantees (ranging from 25 per cent. to 100 per cent.) are sometimes required for a period within which the ultimate temperature of the machine is reached, and the necessary capacity of the machine is thus increased as certainly as though a larger machine were specified. It would seem that the time duration of overload tests should bear some relation to service conditions. If the service requires a 50 per cent. overload for eight hours or more, a larger machine is evidently necessary.

3. *Regulation*.—Specifications frequently call for a straight line compounding curve, a condition which is practically impossible until we discover a magnetic material which has a straight line saturation curve. Another common requirement in the case of lighting generators is that a drop of say 2 per cent. in speed shall not affect the electromotive force more than two volts, which is also an impossible condition even with a separately excited generator. A reasonable margin in either case, having due regard to the service for which the generator is intended, should always be allowed.

4. *Sparking*.—Modern design and the use of carbon brushes have greatly reduced the trouble from sparking, but machines are sometimes called upon to stand excessive overloads without sparking, which can be accomplished only by using a larger machine or by a distortion of design, which is bad practice. Any good machine with carbon brushes should be able to stand a variation from no load to full load without movement of brushes and without noticeable sparking; it should also stand a reasonable overload, say 25 per cent., without injurious sparking.

5. *Insulation*.—This is a cause of frequent trouble and annoyance. The common practice is to specify an insulation resistance of so many megohms, regardless of the size of the machine and the voltage and conditions of service. Considering the fact that this resistance varies inversely as the area of surface to be insulated, and considering the enormous variations in size, shape, voltage and service requirements of different machines, it is evident that such a test is impracticable and means little or nothing. Insulation resistance is largely a question of dryness, and if an armature be baked for a sufficient length of time almost any resistance within reason can be obtained. I have known a large 400 kw. lighting armature to measure a megohm resistance, as required by specifications, after several days' baking (which by the way permanently injures the structural strength of the insulating material), and yet it showed practically no resistance when it reached its destination, because it had been in the rain and dampness for a week or more, and the large surface naturally afforded an excellent lodging-place for moisture. A dry run in a weak field, with the armature short-circuited, quickly brought the insulation up again.

The only proper way to insure good insulation, with reference both to the material used and the method of construction employed, is by a *high potential* test applied when the machine is reasonably dry. This test should be intelligently gauged by the voltage of the machine and the service required. Thus a high potential test of 1,000 volts is ample to detect any insulation weakness in a 125-volt lighting generator, while a 5,000-volt test is ample for a 1,000 volt alternator, allowing proper factor of safety in each case. Recent careful investigations have devel-

oped the fact that the only correct way in which to determine the proper high potential test for any given machine is to consider jointly the time duration of test, the current frequency and the voltage of machine. As the latter rises, the margin between it and the test voltage necessarily decreases, on account of the liability to permanent injury of the insulation when subjected to excessive voltages. Because 5,000 volts is found to be a proper test voltage for a 1,000-volt machine, it by no means follows that 50,000 volts is proper for a 10,000-volt machine, or that the apparent factor of safety should be the same as the voltage rises. There should be a careful formulation of proper high potential tests for different classes of apparatus, based upon scientific investigation and tests, and it is believed that it would not be a matter of any great difficulty to formulate such a schedule.

It is earnestly to be hoped that the Institute will consider that these questions come properly within its sphere of action, and that it will take action in a matter of so much moment to all concerned. It should be remembered that where special conditions are imposed which lead to distortion of design or to the manufacture of special apparatus, the purchaser, no less than the manufacturer, is bound to suffer, and it is the purchaser who pays the bills, directly or indirectly. If the purchaser finds himself involved in unexpected expenditures, the consulting engineer, too, comes in for his share of blame and dissatisfaction.

We come finally to the commercial requirements which have gradually found their way into specifications, and which are sometimes onerous and unfair. Perhaps the most important of these is the question of shipments. It is not uncommon for shipment to be specified by a certain date, under a forfeiture of so many dollars a day for each day's delay thereafter, and the award of the contract is often largely affected by such promises. The manufacturer starts the work in his shops and if the time is short he is apt to work overtime. About the time the apparatus is ready for shipment, and without any previous warning, word comes to withhold shipment because the purchaser is not ready to receive it. There were recently fifteen carloads of apparatus lying in the yards of one of our manufacturing establishments, besides a number of large machines stored in the shipping and testing departments, which had been made on time contracts and held at the last moment by request of the customer. It is difficult for one not in this end of the business to realize the resulting demoralization throughout the shops, and it is a condition which could easily be remedied by the exercise of more foresight on the part of the purchaser and his engineer. In all cases where a penalty for delay in shipment is imposed, it is fair and reasonable to ask that a similar bonus should be awarded if shipment is made in advance of promised date, or if the purchaser is unable, through no fault of the manufacturer, to receive the apparatus on that date. It is sometimes required that the consulting engineer shall have free access to the shops at all times while the apparatus is in production. Such permission is impracticable if proper shop administration and discipline are maintained, and these visits should be made at certain specified stages of the work. It is of course always proper for an engineer to be present when the apparatus is finally tested.

A clause is commonly found in specifications providing that the consulting engineer shall be sole judge of the true intent and meaning of the specifications; and in case of any dispute thereunder his decision shall be final and binding. It is true that this clause is common in architects' and builders' contracts, but it is doubtful whether it could be enforced at law in case of a dispute as to facts, and it certainly seems fair that in case of such a dispute, where the two parties honestly disagree, provision should be made for a third, disinterested party to act as arbiter.

While there are many contracts executed which involve one or more of the provisions (technical or

commercial) mentioned above as liable to cause trouble, and where no trouble is experienced, due to the common sense and good judgment of both engineer and manufacturer, still the cases where trouble does arise are not infrequent, and the best specification is one so fair and so clear that no dispute or misunderstanding can arise except with malicious intent, and which requires no arbiter to interpret its true intent and meaning.

In conclusion let us hope that the customer, the consulting engineer and the manufacturer will in the future consult each other more freely and frankly, by personal interview or by correspondence, and that all of them will unite in endorsing any intelligent attempt to standardize such tests and technical requirements of electrical apparatus as are matters of common usage in our daily business intercourse.

RAILWAY BONDING.*

BY WALTER E. HARRINGTON.

Each manufacturer of rail bonds states his bond to be the best; the number of bonds now upon the market approximate closely about twenty different designs.

It is a difficult matter to determine which bond is the best adapted to your conditions. What may possibly answer under certain conditions will not answer under others. The majority of bonds are designed to make lateral contact with a hole in the web of the rail. This at once defines the necessity of good, clean, uniform surface in the hole, in order to insure good contact. While it may seem an easy matter to obtain good, clean, uniform surfaces, the facts are, that in the majority of instances, holes are not true and are full of ridges.

The writer has frequently removed bonds where it seemed as if every precaution possible had been observed to make good contact, with barely more than 10 per cent. of contact. In some instances, the bonds could be readily pulled out of their holes.

Furthermore, rails will be either punched or drilled for bonds by the mill, and the holes will frequently become coated with rust before the rails are placed, resulting either in the necessity of using a file or reamer, making the holes larger than they should be. I do not wish to convey the impression that good contact cannot be made with bonds making connections through a hole in the web of the rail, as this can be done; but the frequent bad contacts upset one's confidence in them.

The use of the Edison-Brown amalgam, to improve the contacts of copper bonds, showed some very interesting results; used with the Crown bond, manufactured by the Washburn & Moen Manufacturing Company, the joint showed a decrease of 24 per cent. in resistance by amalgamating; whereas the Columbia bond, manufactured by the John A. Roehling's Sons Company, only showed a decrease of 5 per cent., showing conclusively that the forms of contact made by the Columbia bond is far superior to the Crown. This is substantiated by the data in the accompanying table, which show that the Columbia

The troubles incident to making contact in a hole in the web of the rail led to the trial of the much-abused Bryan bond. This bond consists of a large number of parts, and is open to the objection that a bronze casting is used as part of the conductor. The bond, in brief, consists of two No. 0000 copper wires, clamped by bronze and iron castings, the bronze casting in contact with a corrugated copper washer, which is in contact with a freshly-made contact surface upon the face of the rail; the whole held together by a 1-inch bolt and nut, with a lock washer. This bond overcomes the radical objections inherent in the type such as the Crown, Columbia, depending upon their contact with the sides of a hole. The resistance of such a bond without the Edison-Brown alloy is very high. Compared with two Crown bonds non-amalgamated, it shows a resistance of 116 per cent. higher, but the amalgamation makes a remarkable difference; comparing it with the non-amalgamated Crown bond, makes a difference of just 42 per cent. in favor of the Bryan (when amalgamated), whereas compared with two Crown bonds, amalgamated, makes a lesser difference of 23 per cent. in favor of the Bryan bond, amalgamated, with a still further advantage of permanency.

The great objection to the Crown, Columbia, etc., type of bonds consists chiefly in the mechanical defects inherent in them. The vibration of the rail, with the play of the rail joint, results in a continual stress upon the small area of the contact, followed with the final loosening of the bond.

The writer has removed bonds of the above types which had been in service only a few years, and that had become loose, and the continual movement had worn the bond approximately 1-inch smaller in diameter in places. The Bryan bond and those types which are flexible, particularly the Edison-Brown type, are free from such mechanical defects.

While it is not the purpose of the writer to make the tests herein outlined to demonstrate the virtues of the Edison-Brown, still the results were so pronounced that especial stress is laid upon them, particularly since practical experience has demonstrated their permanency.

It will be noticed that the plastic cork type of Edison-Brown bond gave the lowest resistance of any of the bonds tested.

Conclusions:

- (1) The Edison-Brown plastic cork bond gives the best results.
- (2) The Standard bond, under fishplate, is excellent, but is difficult to place.
- (3) The Bryan bond is the best round fishplate type of bond, both electrically and mechanically, provided, however, that the bond is thoroughly amalgamated with the Edison-Brown alloys.
- (4) The Crown and Columbia types of bonds would not be so objectionable if they were stranded and the strands protected from electrolysis.
- (5) The Crown type of bond is rendered materially efficient by the use of the Edison-Brown alloys,

NOTE.—Tests made on Pennsylvania Steel Company's 7-inch girder rail, No. 238. A resistance of bond. B resistance of joint only.

bond has a resistance of 53 per cent. of the Crown (neither amalgamated).

* Paper read at the Franklin Institute meeting, Philadelphia, Nov. 1, 1897.

while the Columbia type is only benefited slightly. In both instances the Columbia is the better bond.

- (6) Iron-wire bonds are highly inefficient.
- (7) Any method of testing wherein drop in poten-

tial is measured from the same contacts through which current flows to make measurements lead to false readings, as the measurements include the drop in the contacts.

THE INSULATION OF ELECTRICAL TESTING INSTRUMENTS.*

BY J. WRIGHT.

The importance of efficient insulation for testing instruments cannot be too strongly impressed on those who include electrical testing in their category of daily duties. Without it, accurate results are an unknown quantity, and, in fact, with some testing installations the writer has come across it is a wonder that the users were able to obtain any results at all. When one comes to consider the extreme sensitiveness of that delicate instrument, the Thomson reflecting galvanometer, the necessity for efficient insulation comes as a matter of course.

These instruments are practically built on an insulating basis; nevertheless, their feet should be mounted on insulating pedestals of some description. A very good form for this purpose is that shown in Fig. 1, which represents a plan and cross-sectional elevation. It is a disk of hard rubber or ebonite about 1/2 in. in thickness, and in the upper face of which is turned a semi-circular groove or channel, A, about 3/4 in. wide. Into this is poured hot, molten paraffin wax of the pure white variety. It is allowed to harden, and is then pared off flush with the

FIG. 1.

ebonite. In the center of the ebonite disk is turned a small conical depression to receive the point of the leveling screw of the galvanometer. These disks form a very effective insulation, but they require to be kept clean and free from dust, which by settling on the wax lowers its insulating properties. In order to ensure a clean surface on the wax, the groove, B, should be periodically scraped out and refilled with fresh wax.

The foot described above is sufficient for all ordinary purposes, but an insulator with higher insulating properties still has been designed, and is illustrated in Fig. 2, which represents a cross-sectional elevation. A is, as before, a cylindrical block of ebonite, with a channel, B, turned in it to contain a resin oil. As will be seen from the figure, the channel is infinitely better protected in this case from dust than previously; the center of the block, rising as it does in the form of a pedestal, practically covers in the whole of the oil-containing vessel. It will be noticed also that the exterior walls of the cylinder at C are ribbed, the object of such corrugations being to increase the area of insulating surface on the ebonite. The oil is introduced into the channel, B, of these insulators by means of a special siphon tube constructed for the purpose.

It must be borne in mind that all ebonite pillars and blocks used for the insulation of testing apparatus depend for their insulating properties on the area of their surfaces. Take an example, as in Fig. 3, which represents an ebonite cone of the form some-

* From the *Electrical Engineer*, London.

times used to support the contacts of battery and galvanometer. Keys *a* and *b* represent screw holes tapped in the ebonite to take the fittings. The insulating surface between the metallic screws, *a* and *b*, will then extend over the exterior of the cone as shown by the arrows, so that to bore the screw holes completely through the center of the block would be to rob it of 75 per cent. of its efficiency as an insulator, the surface then only extending from *a* to *b* direct, as well as running the risk of contact between the screws if not cut sufficiently short.

Where necessity compels the setting up of an installation of testing instruments in a damp locality, it is as well to cover the whole table or bench in the first instance with a piece of gutta percha or ebonite. Wherever possible, a room should be selected which can be warmed by a dry heating process, and kept at as even a temperature as possible both day and night. It is a good plan to proceed as follows with regard to the fixing of such apparatus as keys and others which require permanent fixing. Instead of screwing them to the wooden base, which has the disadvantage of detracting somewhat from their insulating properties, let them be well secured by a layer of molten Chatterton's compound on the underside of their bases. This makes a capital cement for the purpose, and has the additional advantage of being proof against moisture.

As regards the testing battery, which is certainly not least in importance, this requires very careful treatment, especially if set up in a fixed position, as

FIG. 2.

all the good points gained in other respects will be lost if the insulation of the battery itself be defective. They should be set up in a room apart from the instruments, which has the advantage of a dry atmosphere. A convenient number (say 20 cells) may be mounted together, on dry, well-seasoned wooden shelves, open to the air on both sides, and covered over all with a coating of shellac varnish. Each shelf should be mounted on a set of insulators similar to those illustrated in Figs. 4 and 5, the former of which is the type generally employed for insulating a battery of accumulators. It consists (Fig. 1) of two portions, A and B, both made in thick green glass. The lower one, A, is a kind of circular tray, carrying a ring of insulating oil, C, and supporting at its center the upper piece, B, which takes the form of an inverted cup, and supports in its turn the shelf to be insulated.

The second form of oil insulator suitable for the purpose is that illustrated in cross-section in Fig. 5, and is manufactured by Messrs. Johnson & Phillips. A is the porcelain body, and B the usual insulator bolt, C being the oil channel. These are very efficient insulators, and the fact is clearly proved by the following experiment, which was performed by the writer on one of this type before the introduction of the oil. The porcelain body having first been thoroughly well warmed, it was immersed to within a 1/2 in. of the rim in water. The high-tension side of a step-up transformer was then connected on one side to the central bolt, and on the other to the water. A gradually increasing voltage was applied, the maximum being 15,000, but no impression whatever was made upon the insulator, which came out of the bath as sound as when it entered. Any cells

showing a disposition to leak or "creep" should be at once removed and replaced by new ones, as they give rise in time to a pool of liquid electrolyte on the shelf which, if allowed to accumulate, not only promotes leakage from cell to cell, but is also liable to flow down over the supports and impair their insulating properties.

Another important point to be observed in the setting up of a testing installation is the class of wire

FIG. 3.

used for connections. This should in all possible cases be gutta-percha covered, as surface leakage over the insulation will then be reduced to a minimum. If, however, no wire of this class be attainable, the ordinary vulcanized india-rubber-covered wire should be used, the ends having been in the first instance carefully prepared as follows: Strip back the braiding by means of a sharp knife for some 3 in., taking care not to injure the rubber underneath in any way. Next proceed to unlap the proof tape for the same distance. If any difficulty be experienced in getting the tape to leave the rubber, it may be overcome by saturating the tape with coal-tar naphtha. This may be effected by passing a rag soaked in naphtha backwards and forwards over the tape; it will then leave the rubber with ease, and the surface of the latter should then be scraped clean of any impurities. The copper conductor is then bared of rubber for a distance of about 1 in. from the end, and the extremity of the rubber pared down after the manner of sharpening a lead pencil, thus exposing a clean surface of freshly cut rubber. The ends having been thus far prepared are immersed for the space of a few seconds in hot melted paraffin wax, which, when cool, forms an efficient insulating film against surface leakage. Rubber-covered wire prepared in this manner is very nearly, if not quite, as good for the purpose as gutta-percha-covered conductors; the latter are, however, to be recommended in preference, as they are much less trouble to prepare, and are absolutely proof against surface leakage. This treat-

FIG. 4.

ment of connecting wires also applies, of course, to all exterior leads used in connecting up the subject to be tested. It is not a bad plan to give the ebonite portion of testing instruments, keys, and other apparatus a periodical polish with a rag saturated in paraffin oil, any excess of the latter being afterwards removed by the application of a clean, dry cloth. This not only removes any accumulation of dust and

dirt, but also envelops them in a film of liquid which has high insulating properties.

The matter of insulation in high-tension work, when voltages of 1,000 and upwards are employed, is of even greater importance, not so much in this case for accuracy's sake as in the risk to life and limb. The cases of transformers, high-tension switches, and recording instruments should, if metallic, be, if possible, earthed, and if not, should at any rate be sufficiently protected to prevent personal contact. As regards the handles of high-tension switches, these should be constructed of fairly thick ebonite, and an element of safety is introduced by the addition of a disk of the same material some 3 in. or 4 in. in diameter around the handle of the active lever at the point where it merges into metal. Some high-tension switches, more especially those which are semi-automatic in their action, are provided with two cords, the act of pulling one or the other of which actuates the switch. Such methods are not to be advocated, however, as they have several drawbacks. In addition to the difficulty of effectually manipulating a cord, there is also the risk of breaking at a critical moment. The writer's idea of a switch for high-tension work is one with a long and well-insulated lever handle actuating a quick-break system, there being a certain amount of satisfaction in working such a piece of mechanism.

When the voltage exceeds 5,000 it is advisable to use oil-insulated transformers, which are far less liable to break down and give trouble, and even if

FIG. 5.

they should "blow out" by any means, it as a rule only necessitates shutting down for a short period to allow the oil to settle and thereby clear the fault. The best oil for the purpose is thick resin oil of the consistence of treacle.

The use of rubber gloves in high-tension work is a thing to be avoided. It gives rise to a false feeling of security, and may lead eventually to carelessness. There is no absolute safety in handling a live lead through the medium of rubber gauntlets. One never knows from one minute to another how perfect the rubber may be. It is always better, therefore, if absolutely necessary to manipulate a live lead, to do so at the end of a substantial bar of ebonite, some 3 ft. or 4 ft. in length; or another plan is to slip a piece of ebonite tubing, about 1 ft. long, over the lead, and utilize it as a handle by which to support the latter. When experimenting in high voltages, one is apt to be startled at first by the suspicious sound caused by static discharges across the highly-charged terminals of the transformer and other apparatus. It is not unlike the buzzing of a fly, and is, as before mentioned, somewhat alarming to the novice, who usually at once suspects a leak or a break-down of some kind. It need not, however, be taken into consideration, as it is merely due to static effects and has no influence on the actual circuits.

In concluding this article, the writer ventures to hope that it may contain matter of interest to those whose duties are included under the title of "electricians."

THE NEW YORK ELECTRICAL SOCIETY.

On the 12th inst. the New York Electrical Society held its 184th meeting at the College of the City of New York, where most of this season's meetings of the Society will be held.

Mr. S. Dana Greene read a valuable and interesting paper on "The Relations Between the Customer, the Consulting Engineer, and the Electric Manufacturer."

A discussion of this paper followed in which Messrs. Max Osterberg, Gano S. Dunn, C. O. Mailloux, H. B. Coho and Drs. C. E. Emery and F. B. Crocker took part.

The following resolution on "Standardization" was presented and adopted:

Resolved, That in view of the excellent suggestions and recommendations on standardizing apparatus embodied in Mr. S. D. Greene's paper, the Society hereby expresses its approval of efforts in that direction, and invites the American Institute of Electrical Engineers to consider some comprehensive plan for such standardization of American apparatus for electric light and power.

The following were elected to membership in the Society:

Otto Rothenstein, Otto Electric Company, Times Building, New York City.

F. K. Vreeland, 228 Orange Road, Montclair, N. J.

F. V. Henshaw, 79 State street, Brooklyn, N. Y.

S. L. Griswold Knox, Crocker-Wheeler Electric Company, Ampere, Newark, N. J.

John Neilson, superintendent Larchmont Electric Company, Larchmont, N. Y.

Putnam A. Bates, 113 West 72d st., New York.

E. E. Higgins, 26 Cortlandt st., New York.

Thomas A. Edison, 96 Broadway, New York.

THE ELECTRICAL EXHIBITION.

At the request of the President, the Secretary read the following announcement:

"For some time past the New York Electrical Society has been considering means for enlarging its scope of usefulness, and addressing a larger clientele among the citizens of New York, so as to bring the public into more intimate relations with the scientific aspect of all classes of electrical work. The proposition to hold an Electrical Exhibition at Madison Square Garden next May appeared to the Society to afford it the needed opportunity for putting itself prominently before the public as the oldest electrical body in the country, and the recognized local Society, aiming by papers and discussions to diffuse the best electrical information.

"The Electrical Exhibition has very promptly and generously met the views of the New York Electrical Society, and has not only apportioned its space in the Exhibition Hall for a booth and rendezvous for its members and friends, but has also placed at its disposal a contribution of funds for its educational work. This amount will be increased by a percentage of the admission receipts of the Exhibition, which is to be held under the auspices of the New York Electrical Society. Members of the Society will be admitted to the Exhibition at half price.

"It is believed, from what is already known, that this Exhibition will surpass anything of the kind ever done in this city, and will during the continuance of a month not only do much to promote electric interests, but enable the Society to reach a great many thousand people who should know of its work, and many hundreds who should unquestionably be in its membership.

"The Electrical Society is now organizing committees and laying plans for a hearty and active co-operation in the work of the Exhibition, and looking, of course, to its own increase of membership and its fuller recognition as an authoritative, influential body.

"It is hoped and expected that this will mark the beginning of one of the most successful moves ever undertaken by the Society, and approving comments of friends and members encourage the

executive committee to believe that they will be enthusiastically supported in the programme, the sole object of which is to increase and extend the Society's usefulness. The officers would, therefore, not only urge the members of the Society, individually and collectively, to assist in making the Exhibition as brilliant a success as possible for the direct benefit that such success will confer on the Society, but also wish to impress on members the desirability of active co-operation with a view of increasing the membership (a membership which now standing at four hundred, should be at least a thousand before the year is out).

"It has been suggested that the Advisory Committee of the Society, representing its interests with the officers of the Exhibition and for other Exhibition purposes, should consist of the present officers and all the living ex-Presidents, namely: Frank W. Jones, John M. Pendleton, Dr. F. B. Crocker, Joseph Wetzler, C. O. Mailloux, John W. Lieb, Jr., Dr. C. E. Emery, all of whom, it is understood, will gladly co-operate in this movement to develop work to which they themselves have so actively contributed in past years."

The following resolution was put to the meeting and adopted:

Resolved, That having heard the report of the officers of the Society in regard to the arrangement effected for co-operation with the approaching Electrical Exhibition in this city, the members hereby express their hearty approval and pledge themselves to active work, that shall make the most of this opportunity for promoting the interests of electricity and the welfare of the Society.

CONGRESSIONAL NOTES.

A bill is before the House to establish engineering experiment stations in connection with the colleges established throughout the United States, where investigations and researches may be carried on relative to the principles and applications of the various branches of the science of engineering and of naval architecture; to aid the Navy Department in its researches, to enlist the co-operation of builders, manufacturers and industrial establishments in the prosecution of such experimental work as will secure to the naval service the best material, the highest type of motive power and other machinery and accessories for war ships and other naval vessels; to aid States and Territories in the experimental determination of the composition and value of their minerals, fuels, constructive materials and other resources, as well as the scientific and economic questions involved in the utilization of raw materials and the development of water, steam and electric power in the production of manufactured products; and to this end it is asked that an appropriate amount be set aside from year to year by the Government for the furtherance of such an idea.

Representative Bennet has introduced a bill to provide for a contract between the Government and the Pacific Cable Company of New York, whereby for the sum of \$125,000 per year, payable quarterly, for twenty years, official communication may be maintained between the United States and Honolulu in the Hawaiian Islands either by means of electrical or other methods, through a submarine cable or cables and connecting land lines; also to Japan and Australia.

It is proposed to regulate the charges for telephone service in the District by means of Congressional regulations, which would place a charge of \$25 per annum for telephones in private houses, \$35 for those put in business houses, and \$50 per annum for all telephones placed in hotels. The bill carries with it a provision for a fine of \$250 for each and every contract that should be made for charges in excess of the amounts named above.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

Dr. Herz's Claim for Indemnity.

We learn from the Washington *Star* that counsel for Dr. Cornelius Herz have presented to the State Department a claim for indemnity in the sum of \$5,000,000 against the French Government for alleged persecution. In announcing this fact the *Star* says: "Dr. Herz stands high in scientific circles as an electrician and physicist. Although born in France, of French parents, he is an American citizen. Young Herz was educated in the New York Free Academy and at Heidelberg and other great European universities. Meanwhile his fame as an electrician had spread and he did much to extend the study of this branch of science. He married an American woman, and when his children were born in Paris he caused them to be registered as American citizens."

"January 19, 1893, his troubles began. He was in Bournemouth, England, with his wife, in bad health, when he was arrested under extradition proceedings on a warrant from the French Government charging him with fraud and embezzlement growing out of the Panama Canal scandal. The case was kept open and he was continued under arrest in his bed four years. Then the British Parliament came to his relief and passed a special act that permitted the magistrate to attend Herz's bedside and take his testimony. This was done and the magistrate promptly declared that the charges were utterly invalid. That was on May 2, 1896, and Herz was released from arrest. Meanwhile the French Government had instituted numerous proceedings against him in France and confiscated all of the property of himself and of his wife. Dr. Herz alleged that this was persecution pure and simple and that the French Government knew that the charges against him were baseless before his trial. Therefore, claiming to have been injured in name and health and in other ways, he demands that the State Department shall prefer a claim against the French Government in full reparation.

"The State Department has taken the case under advisement."

The Brush Electric Light Stock Suit.

The Savannah *News* of the 8th inst. says: "There will probably be no settlement of the bail in trover suit involving the ownership of the fifty shares of Brush Electric Light & Power Company's stock, sent here some time ago for the purpose of having the dividends collected through the Southern Bank.

"Mr. George T. Hanchett of Hackensack, N. J., who sent the stock to Savannah for the collection of back dividends, has sent a list of his witnesses to Messrs. Mercer & Mercer, and has given every indication that he will defend his title to the stock to the end. Among his witnesses is Dr. Elroy M. Avery of Cleveland, O., from whom he secured the stock. Dr. Avery secured it from the Cleveland company, along with other shares which were long ago turned in to the Savannah company. It is understood Dr. Avery holds that Mr. Hanchett's possession of the stock is bona fide and legal, and every effort will be put forward to make that showing when the case comes up.

"The value of the shares with the dividends due amounts to something like \$12,000, as it has been years since any dividends were collected. It was thought some time ago that a settlement in the shape of a compromise would be made, and Messrs. Saussy & Saussy had a consultation with Messrs. Mercer & Mercer looking to that end. Mr. Hanchett, it appears, however, does not want any compromise, and the case will no doubt go to trial in the City Court."

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

International Competition for the Phebe Hearst Architectural Plan of the University of California.

The trustees of the Phebe A. Hearst architectural plan of the University of California have issued their invitation to the architects of the world to co-operate "in the preparation of a permanent general plan of the buildings and grounds which are to compose the University of California."

The invitation is in the form of a handsomely printed pamphlet of forty pages, entitled "Programme for an International Competition for the Phebe Hearst Architectural Plan of the University of California." It opens as follows:

"The trustees appointed by Mrs. Phebe A. Hearst hereby invite the co-operation of the architects of the world in the preparation of a permanent general plan of the buildings and grounds which are to compose the University of California, in Berkeley, near San Francisco, Cal."

The competition is to be double, a preliminary and final. The preliminary is open to the world. The final will be limited to those whose work in the preliminary is decided by the jury of award to be of such worth and merit as to entitle them to be considered in the final competition. All plans submitted for the preliminary competition must be deposited with the United States Consul at Antwerp, Belgium, before July 1, 1898.

Rules have been adopted so that the members of the jury of award will not know who is the author of any plan. All plans that the jury do not consider worthy of being retained will be returned to their authors. The plans retained will become the property of the University of California, but the name of a successful author will not be made public without his consent. At least ten plans will be retained, and if only that number the author of each will receive \$1,500. If not exceeding fifteen plans are retained \$1,200 will be paid to each, and if more than fifteen are retained \$1,000 will be paid to each.

Competitors in the final competition who desire to study the site of the proposed buildings on the ground will be provided with transportation and expenses for the journey from their residences to San Francisco and return. A total sum of at least \$20,000 will be devoted to premiums for the best plans in the final competition, and of this at least \$3,000 will be awarded to the plan classed as No. 1.

The jury for the preliminary competition will be international, being composed of these members: Messrs. R. Norman Shaw, 6 Ellerdale Road, Hampstead, London; J. L. Pascal, 8 Boulevard St. Denis, Paris; Paul Wallot, 6 Hahnel-Strasse, Dresden; Walter Cook, 674 Broadway, New York, N. Y.; J. B. Reinstein, 217 Sansome street, San Francisco, Cal. For the final competition four architects will be added to this jury, who will be chosen by its members, aided by lists of names submitted by successful preliminary competitors.

The general grouping of requirements includes a library with a capacity for 750,000 volumes, a gymnasium with separate halls and appurtenant accommodation for men and women students, and separate swimming baths for each, two auditoriums, of which one shall seat 5,000 people, dormitories, club-houses for students and faculty, an elaborate military establishment; an infirmary, and all suitable structures and provisions for the fifteen departments thus far contemplated by the University.

Requests for further information may be addressed to Trustees Phebe Hearst Architectural Plan, University of California, 217 Sansome street, San Francisco, Cal.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

LEGAL NOTES.

The Supreme Court of Louisiana held, in the case of Malochée vs. Great Southern Telephone and Telegraph Company, that where a subscriber for telephone service, in default of payment stipulated for the service, was notified by the telephone company that the telephone instruments would be removed from his premises unless he paid the amount due, and he replied that the telephone company could do as it pleased, he had no claim for damages because the instruments were thereafter removed by the company, the written notice of the removal specified in the contract being regarded as wholly unnecessary and as having been waived.

On the bill of complaint filed in the United States Circuit Court at Galveston, Tex., by the Massachusetts Loan & Trust Company against the Citizens' Electric Light & Power Company of Houston, Judge Bryant has issued an order appointing Blake Dupree of Houston receiver of the company. The Massachusetts Loan & Trust Company is the holder of 150 first mortgage bonds of the company of the denomination of \$1,000 and bearing interest at the rate of 6 per cent. per annum. The company has defaulted on the interest on these bonds since September, 1896.

Judge Woolson has signed and filed a decree in the Federal Court at Keokuk, Ia., ordering the sale of the Ottumwa Electric Railway. The court orders a mortgage for \$236,000, with interest from December 1, 1897, foreclosed, and the property sold within thirty days. The Illinois Trust & Savings Bank, trustee, was the complainant.

The case of the Thomson-Houston Electric Company, complainant, appellant, vs. the Athol Orange Street Railroad Company, defendant, appellee, was before the U. S. Circuit Court of Appeals in Boston last week. The suit was originally brought on alleged infringement of patent No. 446,260 for an improvement in electric motor suspension, issued to E. W. Rice, Jr., March 17, 1891, and also upon patent No. 470,817, granted to F. O. Blackwell, March 15, 1892, for an improvement in electric motors. Decision was reserved.

The Supreme Court of the United States held in the recent case of Hyer vs. the Richmond (Va.) Traction Company et al., that a contract between promoters of rival street railways competing for the grant of a franchise from a city council whereby the ordinance of one company is withdrawn in favor of the ordinance of the other, the promoters of the two companies agreeing to co-operate in securing the franchise in the name of one and to divide equally whatever may be realized from the enterprise, is not necessarily null and void on grounds of public policy.

A verdict for \$10,500 was secured about a month ago by Willis Kimball of Charlestown from a jury against the West End Street Railway for injuries received on June 17, 1896, in a collision of cars. The defendant admitted its liability at the trial, so that the only question submitted to the jury was one of damages. After the verdict was given the defendant moved to set it aside as excessive. This was argued at considerable length, and on December 22 Judge Hammond entered the following order: "All above \$6,500 is excessive; verdict to be set aside, unless on or before January 5, 1898, the plaintiff file in the clerk's office a writing remitting all above that sum." The plaintiff has accepted the reduction, and has taken \$4,000 less than his verdict. "This order of the Court," says the Boston Transcript, "is interesting as it is made in pursuance of chapter 472 of the acts of 1897, which provides that in civil cases in which any questions or issues are submitted to a jury, no verdict shall be set aside as excessive unless the prevailing party is first given an opportunity to remit so much of the verdict as the Court shall adjudge to be excessive. The testimony of the medical men called in this case was particularly interesting, the issue being whether plaintiff had an impacted fracture of the hip, with bruising of the pelvic bone, or whether his injuries were severe and painful bruises and chiefly muscular. At the hearing on the motion, Judge Hammond stated that if he should come to the conclusion that the hip bone was broken he should not reduce the amount of the verdict."

CANADIAN NOTES.

One of the commercial sensations of the year at Montreal was created when it was announced that hereafter the Montreal Electric Street Railway would not only pay its dividends quarterly but would increase them to 2½ per cent. quarterly. The stock is now quoted at 243½, having risen 7½ points immediately when the increase of dividends to 10 per cent. per annum was made known.

An electric horn has just been placed upon the market here which is capable of making a prodigious noise and sounding much like a marine fog horn. This electric horn is the invention of Mr. A. Trudeau of Ottawa. The need of a horn of this kind suggested itself to Mr. Trudeau after the disastrous fire at the Ottawa College, where a serious calamity might have taken place had the fire occurred in the night time. These horns of a specified size may be utilized as a fire alarm for waking pupils in dormitories, or in the morning, of scholastic institutions or for any purpose where a whistle might be used where there is an electric current available. The horns can be placed in different parts of a building and all set tooting at once by turning on the current.

An increase of \$500 per day in the receipts of the Toronto Street Railway over the figures of a short time ago is a subject of much favorable comment. To the invention of a Toronto citizen, Mr. Michael Power, master car builder of the Toronto Electric Railway Company, there may fairly be given credit to no inconsiderable extent for this improved condition of affairs. Mr. Power is the inventor of the Power track cleaner and digger—a little knife-like device that bobs up and down on the car rails and removes snow, ice and other obstructions. It has worked so effectively that so far this season there has not been any occasion to bring out the ugly sweepers that in the past cleared the track from snow, to the disgust of pedestrians and annoyance of people living along the line of railway and the frightening of horses.

Henry Electrical Society.

The next meeting of the Henry Electrical Society will be held at Columbia University, Engineering Building, Room 302, on Friday evening, January 21, when Mr. D. R. Lovejoy will deliver a lecture on "The Induction Coil and High Potential Discharges."

The lecture will treat of the practical design of the induction coil, and will be illustrated by many experiments showing the various effects obtainable.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

GENERAL NEWS.

What Is Going On in the Electrical World.

Albany, Ind.—The town board has decided to establish a municipal electric lighting plant at a cost of \$20,000.

Anderson, Ind.—It is understood that Superintendent Blizard of the Big Four favors trying the third-rail electric system on that line between Anderson and Marion to meet the service and rates of the new Indiana Gas Belt Electric Railway which parallels the Big Four from Anderson to Alexandria. The Indiana Gas Belt Electric Railway Company is now running its trains as far as Alexandria by regular schedule. Trains run each way every hour. The coaches are the same length and breadth as the ordinary railway coaches, are elegantly upholstered with seats running across instead of lengthwise. There are baggage, mail and express departments, the platforms are vestibuled, the lighting and heating by electricity, and in fact, everything is as complete as a Pullman train.

Buffalo, N. Y.—H. G. Stott, the electrical expert of the Buffalo General Electric Company; L. B. Stillwell, the electrical director of the Cataract Construction Company; Calvert Townley of Pittsburgh, the electrical engineer of the Westinghouse Company, and W. R. L. Emmet of Schenectady, the expert electrician of the General Electric Company, were here a few days ago and held several conferences with officials of the Cataract Company in regard to machines, delivery of power,

etc. The schedule of rates for power will be announced this month.

Chicago.—Representatives of about fifty street railways in all sections of the State met here on the 5th inst., and formed an association for closer co-operation and mutual aid in advancing the interests of street railways throughout the State. The following officers were elected: President, W. H. Patterson, Bloomington; vice president, L. Sherwood, Elgin; secretary and treasurer, T. J. Minary, Springfield; executive committee: W. H. Patterson, C. K. Minary, L. Sherwood, W. L. Ferguson, Decatur; B. F. Harris, Champaign; J. Barker, Peoria, and W. F. Brennan, Chicago.—Alderman Powers has introduced an ordinance providing for an extensive subway system to be constructed by a company headed by George W. Jackson, who has built most of the subways of Chicago. In exchange for carrying the city's water mains and electric wires the ordinance carries a franchise covering the city between the lake, Ashland avenue, Division street and Twenty-second street. The company proposes to put down a subway in each street of the district sixteen feet square in which to carry every water and gas main, all electric light, telegraph and telephone wires, and all pneumatic tubes. The corporations now using space under the city streets are to rent space in this subway and save the sums they now spend for tearing up and replacing the pavements. It is estimated that the building of the subways would take seven years, and that they would cost about \$20,000,000.

Clarinda, Ia.—An election will be held here on the 31st inst. to decide whether a ten-year contract for electrically lighting the city will be closed with John H. Packer.

Columbus, O.—The House, without a dissenting voice has repealed the law permitting fifty year franchises to street railroads.

Columbus, Ga.—The Columbus Power Company has completed its organization by electing the following officers: President, H. M. Comer, president of the Central Railroad; treasurer, G. Gunby Jordan; directors: J. F. Hanson and John Hill. The capital stock was increased to \$200,000. The company owns the famous "Lovers' Leap" water power just north of Columbus, and will at once begin building a stone dam across the river and erect a plant for furnishing electric power for manufacturing industries.

Dallas, Tex.—C. H. Alexander last week bought the entire property of the Queen City Electric Street Railway from G. W. Davenport, of Boston. Mr. Alexander recently purchased the Dallas Consolidated Electric Light plant, and chartered the Standard Electric Light, Heat & Power Company. His aggregated transactions in these lines during the last sixty days involved almost \$2,000,000. Seven years ago he was working on a small salary.

Dawson, Minn.—An electric light plant has been put in here by G. H. Simons of Montevideo. The enterprise is the personal effort of A. Thompson of this place.

Delta, Col.—T. C. Dobbins, a Telluride electrician, is negotiating for the electric light franchise recently granted by the Delta city council to W. R. Gale. It is understood that if Mr. Dobbins secures the franchise he will at once commence work on the plant.

Denver, Col.—The Colorado Midland Railroad Company is considering the idea of adopting electricity for lighting its cars by means of a current generated by dynamos attached to the trucks of the cars. It is likely that the Denver & Rio Grande and the Gulf roads will also adopt this system of lighting.

Downingtown, Pa.—The Citizens' Light & Power Company was organized here on the 14th inst., and \$10,000 of the capital stock was subscribed. The company will erect a light and power plant in East Downingtown, and will build a trolley line between Downingtown and that suburb.

Elizabeth, N. J.—The scheme of building a trolley road between Elizabeth and Plainfield at the county's expense has been defeated by a vote of 10 to 7 in the Union county board of freeholders.

Elyria, O.—The Wellington electric light plant has been sold by the sheriff under direction of the court to satisfy claims. The property was bid off by Wellington parties for \$6,335.

Englewood, N. J.—The Bergen County Traction Company, which now operates a trolley line from Fort Lee Ferry to Englewood, N. J., is in active negotiation with the Leonia and Bogota borough councils and the Teaneck township committee for right of way that will permit it to extend its line across country from the easterly boundary of Leonia to Hackensack.

Fort Scott, Kan.—The electric car system in this city, which for a number of years has been owned and operated by the Fort Scott Rapid Transit Railway Company, has been transferred to the Citizens' Railway Company, which is now in control. The new company's officers are: President, Grant Hornaday; vice-president and general manager, W. H. Frost; treasurer, C. B. McDonald; secretary, J. H. Crain. An appropriation has been made by the stockholders for a thorough overhauling of the system. New steam and electrical machinery will be put in in order to take advantage of the light and power franchise recently granted the old company. The new company will also attempt to secure the contract for the city lighting.

Glens Falls, N. Y.—E. L. Ashley has purchased the electrical equipment of the Glens Falls Gas Company and intends to remove it to Kane's Falls. Mr. Ashley purposes making the plant large enough to supply the village of Fort Ann, a mile and a half distant, with about 1,000 incandescent lights and thirty arc lights.

Hadley, Mass.—The selectmen have voted to grant a franchise to the Northampton & Amherst Railway Company to build an electric railroad in Hadley along the State road from the Hadley bridge to the Amherst town line.

Hartford, Conn.—The New England Railroad Company intends at an early date to extend its third-rail electric system from New Britain to Bristol, which will give the latter city connection with Hartford by this system of rapid transit, as there is a line of it already in operation from New Britain to Hartford. The total distance is about 18 miles.

Holyoke, Mass.—The city having voted at the recent election to take the gas and electric lighting plants, the water power company, which owns both, has filed with the city clerk a demand for \$1,000,000 for them, and an annual rental of about \$25,000 for the water power, in addition to cost price for the supplies on hand. The company is capitalized at \$1,200,000 and its entire property appraised by the city at \$2,200,000. The actual selling price will be determined by a commission.

Laconia, N. H.—The stockholders of the Laconia Street Railway Company have about decided to equip their road for electric power. The road is one of the few in New England now using horses for motive power.

Lewiston, Me.—One of the plans of the big electric railroad syndicate recently organized here is to unite the Lewiston & Auburn, the Brunswick & Topsham and the Bath street railroads, and a preliminary survey has been made with this in view. The road will start from the foot of Lisbon street in this city, and run through the towns of Lisbon, Lisbon Falls, to Brunswick, thence to Bath by way of New Meadows. The system, when completed, will have a mileage of more than twice that of any other street railroad in Maine. One plan in the scheme is to lay out a large and magnificent park at a beautiful place at New Meadows, where there will be a theater and everything which the people will desire in the form of recreation. It is planned to make this place the great pleasure spot of central Maine.

Meadville, Pa.—The proposed route for the electric railway from this city to Edinboro has been approved by the engineers. It will go through to Edinboro, as originally intended, via Saegertown, Venango and Cambridge Springs, with important improvements at Conneaut lake, Edinboro, such as will make it a desirable summer resort and especially attractive for excursion and picnic parties. Conneaut lake is a very attractive spot, and the company expects to make it a Mecca for pleasure seekers during the summer seasons.

Metuchen, N. J.—The New Brunswick "Fredonian" says: "It is given out on good authority that a syndicate of capitalists have in view a scheme similar to that which the Middlesex Water Company conceived and executed for the supply of water, except that what they will supply will be electric lighting over nearly the same territory in Metuchen and Raritan Townships. It is said that the project includes an extensive plant to be situated between Metuchen and the Raritan river, so as to be central to the towns and boroughs to be lighted. These include Metuchen, Woodbridge, Sewaren, Carteret, Maurer, and the clay works at Ostrander's, Keasbey's, etc., on this side of the river, and South Amboy on the other side."

Milford, O.—The Cincinnati "Enquirer" states that there is a strong probability that Cleveland capitalists will become financially interested in the project to build an electric railroad from Cincinnati to Milford and Terrace Park, and that it will be built if the people along the route subscribe for a reasonable amount of stock.

Milwaukee, Wis.—The Cloos Electrical Engineering Company has been organized here to manufacture and sell the Cloos safety, economical and electrical devices, with these officers: Herman W. Falk, president; Jacob Cloos, vice-president; E. A. Wurster, secretary; H. R. King, treasurer. Mr. Cloos, the inventor of these devices, was formerly chief engineer of the Pabst Heat, Light & Power Company. These devices are only for the controlling and operation of high potential alternating and direct work.

Mineola, Wood Co., Tex.—Mr. Tilley of Jacksonville, Tex., has signed contracts with the citizens of Mineola for nearly 300 lights, and will establish an electric light plant here.

Montclair, N. J.—The town council in a secret conference is said to have agreed to give a franchise to the North Jersey Street Railway Company to run its cars in Bloomfield avenue and thus complete its line from Newark to Caldwell, but the anti-trolley people propose to prolong the fight, which has extended over many months, as soon as the company presents its formal acceptance of the terms of the franchise and the matter is brought before the council for final action.

Newark, N. J.—The Newark & South Orange Railroad Company and the North Jersey Traction Company have consolidated, and the new company will control all of the roads in Essex County except those of the Consolidated Traction Company. A number of extensions of the lines of the amalgamated companies are in contemplation, the most important being from Irvington to Hilton and from Maplewood to Millburn and Springfield.

New Haven, Conn.—The annual report of the Connecticut Railroad Commissioners shows that there are 385 miles of trolley road in the State, an increase of about 32 miles over last year. The 29 trolley roads have \$9,770,440 of the stock issued, of which only \$3,106,940 has been issued for cash. Their bonded debt

is \$9,092,800, and floating debt \$1,071,421. They carried last year about 43,000 fewer passengers than they did in 1896. They paid in dividends \$265,625, as compared with \$221,119 in 1896.

New York.—Although the local daily papers have several times stated that the contract for equipping the Manhattan Elevated road with electricity has been let to this or that company, the fact is, as far as we can learn, that the Manhattan people have not as yet applied to the Railroad Commissioners for permission to change the motive power, and have not decided upon any particular system although the subject is under consideration. The best information is that when the contract is let it will be divided between two or three of the big manufacturing concerns, with the Walker Company in the lead on account of certain influences, personal and political.

Niles, Mich.—H. A. Chapin & Son, the millionaire mine owners of this city, are talking of building an electric railroad between Niles and South Bend, Ind. The specifications are already drawn. Chapin & Son own the South Bend electric light plant, and if they build the road power will be derived from this plant.

Nyack, N. Y.—The Nyack Traction Company has been granted a franchise to run its cars in Piermont.

Piedmont, W. Va.—At the election here on the 6th inst. the ticket favorable to electric lights was elected, and a plant will be put in.

Rochester, N. Y.—A trolley railway line is contemplated to extend from Rochester to Craig Colony, Sonyea, by way of Avon, Mt. Morris and Nunda. Rochester capitalists are interested in the project.

Rockville, Conn.—The longest continuous trolley line in the State, that between Hartford and this city, was opened on the 8th inst., with an hourly service, the running time being an hour and a half and the fare 20 cents. The length of the line is 17 miles and it is in effect a parallel of the line of the New England Railroad Company.

St. Louis.—The new Missouri-Edison Company has absorbed the St. Louis Electric Light & Power Company. The deal places the Missouri-Edison Company in almost absolute control of the electric lighting business of St. Louis.

Tacoma, Wash.—Charles B. Hurley, of this city, has acquired a controlling interest in the electric lighting plant at Skagway, Alaska, owned by Charles Phelps, and has made arrangements for increasing its capacity and extending the service to Dyea. The electrical plant now at Skagway has a capacity of 400 incandescent lights, but when the improvements contemplated are made it will be able to supply 2,200 incandescent and 50 arc lights.

Townsend, Mass.—At a special town meeting, held here a few days ago, E. C. Tuttle, U. S. Adams, W. M. Lawrence and H. N. Spaulding were appointed a committee to consider the feasibility of providing electric lighting for the three villages of the town, either by the town or by the investment of private capital, and report at the next town meeting.

Washington, D. C.—The Treasury Department awarded the contract for putting in electric wire conduits and wires for the new electric plant of the city post-office to the Southern Electric Company of Baltimore. The bid of this company was \$20,650, and was the lowest of a number opened some time ago. The wire conduits and the wires are preliminary to the contract which will soon be let for putting in the entire electric light and power plant.

PERSONAL AND MISCELLANEA.

Thomas Behan, who for the past two years has been employed in the drafting department of the General Electric Company at Schenectady, has accepted a similar position with the Fort Wayne Electric Corporation.

A dispatch to the N. Y. "Evening Post" from New Haven, Conn., states that the repeated report that Thomas A. Edison and J. Pierpont Morgan are at the head of a syndicate which has bought the Housatonic water power at Falls Village, in Connecticut, is denied by ex-State Comptroller Staub of New Milford, who has been the owner of that and other water powers of the upper Housatonic. These water powers he purchased or leased from a Connecticut corporation chartered in 1893, and he has since made an arrangement with a New York syndicate for utilizing the Falls Village property, on which about forty five years ago \$200,000 was expended.

The Central-Hudson Railroad Company is placing electrical train indicators in leading hotels in cities through which the trains pass. The indicators will be on keyboards, and the name and number of each train on the Central-Hudson road that enters or leaves the city will be thereon. If the trains are late the number of minutes or hours, as the case may be, will be indicated by pointers. They will be so simple that any one can tell at a glance just how the trains are running. The indicators will be put in by the railroad company free of charge, it is said. A man at the Central-Hudson station will have charge of them and make changes on all the boards by merely pressing a button or two at the station. The boards are proving very convenient for the traveling public.

The Rochester, N. Y., "Herald" says: "The electrical device to be manufactured by the new Rochester Electrical Manufacturing Company is a cutout invented by Police Electrician Louis W. Miller, who has invented several such devices. He invented and placed

in the patrol boxes and fire alarm boxes a cutout that proved of inestimable value to the city, inasmuch as it has saved the citizens hundreds of dollars. It is a frequent occurrence during a storm for the wires running through the city to get crossed, and in former years when this would occur all of the boxes on that circuit would burn out. This would entail a considerable loss to the city, besides leaving a portion of the city cut off from communication with the fire houses or police headquarters. But when the cutouts were put in this expense and danger was obviated. The new cutout patented by Mr. Miller is similar to those already in operation. It is to be put in telephones, watchmen's clocks, district messenger boxes, fire alarm gongs and central office electrical apparatus."

RECENT COMPANY ELECTIONS.

Boston Street Railway, Boston, Mass.—President, William A. Gaston; vice-president, William A. Bancroft; treasurer, William Hooper; secretary and clerk, John T. Barnett; directors: Frederick H. Ayer, of Lowell; Hon. William A. Bancroft, ex-Mayor of Cambridge; Samuel Carr, trustee of the Ames estate; T. Jefferson Coolidge of the Old Colony Trust Company; William Endicott, Jr., of the firm of C. F. Hovey & Co.; William A. Gaston; Gen. Charles J. Paine, one of the members of the International Monetary Commission; F. H. Peabody, senior member of the firm of Kidder, Peabody & Co.; James M. Prendergast, Jacob C. Rogers, banker, and Robert Winsor of Kidder, Peabody & Co.

Bristol County Gas & Electric Light Company, Bristol, Conn.—Directors: Marsden J. Perry, Leander Peck, Barrington; John S. Waterman, Benjamin M. Rosworth, Benjamin B. Martin, Warren; William T. C. Wardwell, William R. Bogert, J. H. Manchester and Samuel P. Colt, Bristol.

Brooklyn City Railroad Company, Brooklyn, N. Y.—Directors: E. H. K. Belcher, George W. Bergen, Eugene Britton, R. L. Edwards, S. L. Husted, Jr., David C. Legett, Frank Lyman, Edward Morrill, George H. Prentiss, Alonzo S. S. Simpson, F. A. Van Iderstine, Edward D. White.

Central Railway & Electric Company, New Britain, Conn.—President, A. M. Young; secretary and general manager, E. H. Mather; treasurer, F. G. Platt.

Chester Traction Company and its leased lines, Chester, Pa.—Chester Traction Company—President, George B. Lindsay; directors: George B. Lindsay, Robert Wetherill, Richard Wetherill, J. Frank Black, Henry C. Howard, Union Traction Company—President, George B. Lindsay; directors: Robert Wetherill, Richard Wetherill, J. Frank Black and Henry C. Howard. Chester Street Railway—President, J. Frank Black; directors: J. Frank Black, Robert Wetherill, Richard Wetherill, George B. Lindsay and George C. Hetzel. Chester, Darby & Philadelphia Railway Company—President, Richard Wetherill; directors: Richard Wetherill, Robert Wetherill, J. Frank Black, George B. Lindsay and George C. Hetzel. Chester & Media Railway Company—President, Richard Wetherill; directors: Richard Wetherill, Robert Wetherill, J. Frank Black, George B. Lindsay and George C. Hetzel.

Fairmount Park & Haddington Railway Company, Philadelphia.—President, Isaac Blum; directors: Simon J. Martin, George D. McCreary, Samuel Y. Heebner, J. Roberts Foulke and Martin V. Burton.

Hestonville, Mantua & Fairmount Passenger Railway Company, Philadelphia.—President, Isaac Blum; directors: Simon J. Martin, George D. McCreary, Samuel Y. Heebner, Ferdinand Marks and Lewis A. Riley.

Hollidaysburg Electric Light & Power Company, Hollidaysburg, Pa.—President, James W. Grounler; vice-president, W. H. Markland; secretary and treasurer, John W. Cliber; directors: W. H. Markland, James W. Grounler, John W. Goodfellow, O. M. Irvin and J. Lee Plummer.

Kings County Electric Light & Power Company, Brooklyn, N. Y.—President, Felix Campbell; vice-president, W. T. Wilson; secretary, S. E. Peck; directors: Seth L. Keenly, Hugh J. Grant, W. T. Wilson, Walter Ferguson, Charles Cooper, George E. Terry and C. L. Peck.

LaCrosse Brush Electric Light & Power Company, LaCrosse, Wis.—President, J. J. Hogan; secretary and treasurer, C. H. Greenwood; directors: J. J. Hogan, E. E. Bentley and James Vincent.

Lausburg & Cohoes Railroad Company, Lausburg, N. Y.—Directors: William Kemp, Otis G. Clark, Charles Clemmshaw, Charles H. Dauchy, Augustus A. Peebles, Edward Van Schoonhoven, Thomas Breslin, Charles H. Smith, C. G. Clemmshaw, J. J. Hagen and William Kemp, Jr.

New Orleans Traction Company, New Orleans, La.—President, R. M. Walmsley; vice-president, J. C. Davis; general manager, C. D. Wyman; secretary and treasurer, A. H. Ford; directors: R. M. Walmsley, C. H. Hyams, A. Baldwin, Sr., Frank T. Howard, J. C. Denis, C. D. Wyman and Geo. W. Norton.

Omaha Street Railway Company, Omaha, Neb.—President, Frank Murphy; vice-president, Guy C. Burton; treasurer, W. W. Marsh; secretary, D. H. Goodrich; general superintendent, F. A. Tucker; directors: Guy C. Burton, J. J. Brown, W. W. Marsh, S. D. Mercer, W. V. Morse, Frank Murphy, E. W. Nash, B. F. Smith (elected to fill the vacancy caused by the death of ex-Senator Paddock), and W. A. Smith.

Ringling Rocks Electric Railway Company, Pottstown, Pa.—President, M. R. Davidheiser; vice-president, T. B. Miller; secretary, Frank S. Brant; treasurer, A. K. Shaner; directors: M. R. Davidheiser, T. B. Miller, A. K. Shaner, F. S. Brant, R. E. Shaner, A. Hartenstine, W. H. Saylor, G. C. Hollenbach and H. G. Rohm.

Schuylkill Electric Railway Company, Pottsville, Pa.—President, C. P. King; directors: R. C. Luther, William F. North, F. H. Treat, W. Matthew Beddow, Thomas B. Prosser, H. H. Pearson, Jr., M. S. Collingwood.

Tanawqua & Pottsville Electric Railroad Company, Pottsville, Pa.—President, Thomas B. Prosser; directors: John F. Finney, C. P. King, F. H. Treat and W. Fallock, Jr.

Troy & Cohoes Railway Company, Troy, N. Y.—Directors: A. A. Peebles, O. G. Clark, William Kemp, Chas. Clemmshaw, C. W. Tillinghast, James A. Eddy, Peter Mc-

Carthy, Thomas Vail, Edward M. Green, C. G. Clemmshaw and J. J. Hagen.

Troy City Railway Company, Troy, N. Y.—Directors: William Kemp, Charles Clemmshaw, Otis G. Clark, Edward Murphy, Jr., Anthony N. Brady, James O. Neil, Peter McCarthy, Thomas Breslin, William Shaw, D. J. Whelan, Clarence N. Flack, Francis N. Mann, Jr., and Edgar L. Freeman.

COMMERCIAL PARAGRAPHS.

The Central Electric Company, 173-175 Adams street, Chicago, seem to be doing a brisk business in the lamp line. Any one desiring to procure brackets, shades or other lamp appurtenances would do well to write the Central Electric Company as they carry an immense variety of such fixings in stock. For a business man obliged to work at night their Kinsman Desk Light would seem all that could be desired.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

No-To-Bac For Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

At this season of the year the amount of iron line material that enters into the business of a large supply house is indeed surprising. The Electric Appliance Company, Chicago, state that they are carrying a stock of these goods that will enable them to make prompt shipments of anything up to a car load, and yet their capacity has been taxed on these goods. The iron mills throughout the country have had a large amount of business this season, and it has at times been very difficult to get iron line material. The Electric Appliance Company, however, anticipated this condition and during the season have been able to keep their stock in shape so that all orders for this material could be shipped promptly. They state that their stock is still being kept up and that customers wanting iron construction material promptly from Chicago stock will not be disappointed.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

In the use of transformers for electric lighting only a comparatively low voltage is introduced into buildings, and as long as this voltage is maintained the electric lighting is safe to human life; but often through faulty construction of the transformer, or failure of the insulation, the primary passes into the secondary wire—then the lighting becomes dangerous. That this does occur in spite of the most careful construction is proven by a number of deaths from this cause. To make electric lighting safe to human life, and to guard against fire, some protecting device must be used. A device of this nature which is everything that could be desired is one invented by Major Cardew and manufactured by the Diamond Electric Company, 1202 Fisher Building, Chicago. In this Earthing Device the action depends on electrostatic attraction between two plates of an aluminous foil; the latter is permanently kept at the potential of the earth while the upper plate under ordinary circumstances has a potential not exceeding the secondary voltage. The electrostatic attraction corresponding to this potential difference is insufficient to raise the foil. If, however, a fault occurs between the primary and secondary, the potential difference immediately rises to such an amount that the electrostatic attraction suffices to raise the foil and bring it into contact with the upper plate, thereby earthing the secondary winding and making the primary fuse go. The apparatus is set to come into action if the potential of the secondary rises to 400 volts. The Diamond Electric Company not only handles this well known device, of which there are 5,000 in use, but also manufactures Scheffler Transformers, which have a wide reputation, and high-grade electrical measuring instruments.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic, 10c or 25c. If C. C. C. fail to cure, druggists refund money.

INCORPORATIONS.

The Middletown Gas & Electric Light Company, Middletown, O. Capital stock, \$50,000.

The Aladdin Light Company, Chicago—to manufacture electrical goods. Capital stock, \$100,000. Incorporators: Frank H. Fuller, Alonzo P. Daniel, Will am B. Reed.

The Electric Light Company of Manitowish, Wis., has filed a notice with the Secretary of State at Madison that it has increased its capital stock from \$50,000 to \$60,000.

The Ward Electric Light & Power Company, Denver, Col.—to operate and maintain an electric plant in Boulder. Capital stock, \$15,000. Incorporators: C. W. Betts, J. A. Kilton and A. W. Olsen.

Colp, Arnold & Co., Cartersville, Ill.—to operate flouring mill, electric light plant and general commission business. Capital stock, \$25,000. Incorporators: John Colp, H. F. Arnold, Monroe Colp and U. L. Walker.

Story Electric Company, Chicago—to do a general electrical business, furnish light, heat and power, and general manufacturing business. Capital stock, \$10,000. Incorporators: W. H. Ut, G. W. Oberlander and Eric Winters.

The Ellwood & New Castle Street Railway Company, Ellwood, Pa.—to operate a street railway running from Ellwood City to New Castle through the towns of Wampum, Newport, Moravia and Mahoningtown. Capital stock, \$80,000.

The Miami River & Belt Railway Company, Sidney, O.—to build and operate an electric railway. Capital stock, \$10,000. Incorporators: I. H. Thedwick, H. T. Mathers, Charles Timmons and Frank Hunter, of Sidney, and A. T. Wells, of Chicago.

The Carson Electric Light Company, Carson, Iowa—to construct and operate an electric light plant in Carson. Capital stock, \$5,000. Incorporators: John F. Reid, president; J. S. Campbell, secretary; D. A. Snapp, treasurer; William F. Hotz, manager.

The Huguenot Electric Street Railway Company of Westchester County, N. Y., New Rochelle—to construct and operate a railroad eleven miles long to run from the railway station in New Rochelle, making a circle through the back country and return to the station. Directors: M. R. Faulkner, John A. Cass and A. B. Linderman, of Philadelphia; Louis K. Fries, Jacob M. Schuyler, James H. Burchell and N. J. Burchell, of New Rochelle; Frank E. Wiggins, of Williamsbridge, and George C. Day, of New York City.

The Los Angeles-Pacific Railway Company, Los Angeles, Cal.—formed for the purpose of consolidating the property and franchises of the two corporations known as the Pasadena & Pacific Railway Company of Arizona and the Pasadena & Pacific Railway Company of California, and to construct and operate electric railway tracks from Los Angeles to Santa Monica, with branch lines running to Hollywood, Laurel canyon, South Santa Monica, Santa Monica canyon and Soldiers' Home, with an estimated length for the whole system of 100 miles. Capital stock, \$1,000,000, fully subscribed. Directors: E. P. Clark, Wm. D. Larrabee, Warren Gillelan, Milton E. Hammond, J. H. Spies, R. F. Jones, A. I. Smith, T. C. Paxton, J. M. Cope, M. H. Sherman, B. N. Pratt, W. C. Durgin and John D. Pope.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JANUARY 4, 1898

ELECTRIC LIGHTS AND APPLIANCES.

596,782. Means for Varying Candle-Power of Incandescent Electric Lamps. Charles E. Felch, Natick, Mass., assignor of one-half to Oliver A. Felch and Walter L. Felch, same place. Filed June 21, 1897.

596,729. Support for Electric Lamps. Otis C. White, Worcester, Mass. Filed Feb. 16, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

596,515. Starting-Box for Electric Motors. John D. Hilder, Yonkers, N. Y., assignor to the Otis Brothers & Company, New York City. Filed Oct. 11, 1897.

596,567. Converter for Monophasic Currents. Andre Blondel and Gaston Sautter, Paris, France. Filed June 27, 1895.

596,923. Automatic Potential-Regulator for Dynamos. Allen A. Tirrill, Whitefield, and Paul S. Tirrill, Groveton, N. H. Filed May 1, 1897.

ELEVATOR APPARATUS.

596,513. Compound Brake for Electric Elevators. John D. Hilder, Yonkers, N. Y., assignor to the Otis Brothers & Company, New York City. Filed Sept. 14, 1896.

596,514. Safety Magnet-Brake. John D. Hilder, Yonkers, N. Y., assignor to the Otis Brothers & Company, New York City. Filed Sept. 21, 1896.

TELEPHONE AND TELEGRAPH APPARATUS.

596,496. Telephone. William Gray, Hartford, Conn., assignor to the Gray Telephone Pay Station Company, same place. Filed April 10, 1896.

596,709. Signaling Apparatus for Telephone Systems. Frank J. Holmes, Cleveland, O. Filed March 25, 1896.

596,601. Supervisory Signal for Telephone Switchboards. Frank R. McBerty, Downer's Grove, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed Oct. 26, 1896.

596,610. Signaling System for Telephone Trunk-Lines. Frank R. McBerty, Downer's Grove, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 24, 1896.

596,625. Plug and Spring-Jack for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 29, 1895.

596,626. Spring-Jack for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed May 14, 1896.

596,627. Annunciator for Telephone-Lines. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed May 14, 1895.

596,628. Supervisory Signal for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 16, 1896.

596,629. Testing Apparatus for Multiple Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 8, 1896.

596,630. Apparatus for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 8, 1896.

TELEPHONE AND TELEGRAPH.

- 596,806. Apparatus for Telephones. Frank B. Cook, Chicago, Ill. Filed March 17, 1896.
 596,808. Telephone-Transmitter. David A. Fleming, Indiana, Pa., assignor to himself and McLain Davis, same place. Filed April 12, 1897.
 596,834. Telephone-Transmitter. James H. Spencer and Malcolm S. Keyes, New York City, assignors to the Spencer Electrical Company, same place. Filed Jan. 14, 1897.
 596,850. Telephone Switch-Plug. Frank B. Cook, Chicago, Ill. Filed Jan. 4, 1896.
 596,851. Telephone Apparatus. Frank B. Cook, Chicago, Ill. Original application filed Nov. 30, 1891. Divided and this application filed Oct. 23, 1895.
 596,852. Switch for Telephone-Circuits. Frank B. Cook, Chicago, Ill. Original application filed March 25, 1895. Divided and this application filed Dec. 1, 1896. Renewed Oct. 25, 1897.

MISCELLANEOUS.

- 596,483. Electric Fan. Oliver F. Conklin, Springfield, O. Filed June 17, 1897.
 596,506. Electric Switch. Warren S. Hill, Hyde Park, Mass., assignor to the W. S. Hill Electric Company, Boston, Mass. Filed May 1, 1896.
 596,612. Press for Making Insulators. Henry M. Brookfield, New York, and Seraphin Kribs, Brooklyn, N. Y., assignors to William Brookfield, New York City. Filed Jan. 2, 1897.
 596,682. Press for Making Insulators. Seraphin Kribs, Brooklyn, N. Y., assignor to William Brookfield, New York City. Filed Jan. 30, 1897.
 596,696. Electric Oven. Levitt E. Custer, Dayton, O. Filed March 16, 1896.
 596,719. Magnetic Ore-Separator. Lewis G. Rowand, Camden, N. J., assignor to the Wetherill Concentrating Company, New York City. Filed April 15, 1897.
 596,774. Electric Signaling Apparatus. Felix B. Herzog, New York City. Filed May 31, 1895.
 596,791. Voltaic Battery. Henri Etienne de Rutz de Lavi-sion, Nemilly-sur-Seine, France. Filed May 28, 1897.
 596,812. Subterranean Electric Conduit. William D. M. Howard, Redwood City, Cal. Filed June 18, 1897.
 596,907. Electric Cable for Propulsion of Vehicles. Addison Norman, Toronto, Canada. Filed July 8, 1896.
 596,926. Trolley-Guard. Herman J. Vogler and Alfredo Flores, San Antonio, Tex.; said Flores assignor to said Vogler. Filed Oct. 16, 1897.
 596,913. Electric Clock. Frederic Richard, Lynn, Mass., assignor of one-half to Theodore Leutz, Boston, Mass. Filed Aug. 21, 1896. Renewed Nov. 24, 1897.
 596,935. Automatic Temperature-Regulator. Addy A. Ross, Detroit, Mich., assignor of thirty-one forty-eighths to Almon C. Varney and Alvin W. Varney, same place. Filed March 31, 1897.

DESIGN.

- 28,124. Electric-Motor Casing. Andrew L. Riker, New York City. Filed Nov. 21, 1897. Term of patent 7 years.

ISSUED JANUARY 11, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 597,056. Electric-Railway Conduit System. Ralph F. Thompson, Alexandria, La., assignor of one-half to Edward Jeremiah Sullivan. Filed July 13, 1897.
 597,156. Electric-Railway Motor. Charles J. Van Depoele, Lynn, Mass.; C. A. Coffin and Albert Wahl, administrators of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Filed June 11, 1890.
 597,159. Automatic Tender for Trolley-Operating Ropes. Charles F. Wilson, Brooklyn, N. Y. Filed Oct. 1, 1896.
 597,202. Electric Railway. Hosea W. Libbey, Boston, Mass. Filed March 10, 1897.
 597,282. Trolley-Guard. Henry F. Hendricks and James H. Denton, Philadelphia, Pa., assignors to James H. Bates, Somerset, Ky. Filed Sept. 12, 1896.
 597,306. Current Collecting Means for Electric-Railway Vehicles. Charles A. Terry, New York City, assignor to the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa. Filed Sept. 7, 1896.
 597,374. Controller for Electric Cars. John C. Henry, Denver, Col. Filed Nov. 6, 1897.
 597,203. Car-Fender. John Megown, Youngstown, O., assignor of one-half to Edmond H. Moore, same place. Filed April 30, 1897.
 597,216. Car-Fender. Paul Jones, Cincinnati, O. Filed April 24, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 597,172. Filament for Incandescent Lamps. Erwin F. von Wilmowsky, Boston, Mass., assignor of one-half to Walter D. Edmonds, New York City. Filed Sept. 8, 1896.
 597,244. Combination Gas and Electric-Light Fixture. Joseph W. Parkin, Philadelphia, Pa. Filed Dec. 23, 1896.

ELECTRICAL MACHINERY AND APPARATUS.

- 597,018. Method of Regulating Speed of Series Electric Motors. Horace F. Marshall, London, England. Filed April 5, 1897.
 597,137. Static-Induction Electric Generator. Adrian L. Bogart, Jamaica, N. Y., assignor to William B. M. Jordan, New York City. Filed May 5, 1897.
 597,180. Electric Transformer. Jacob F. Gates, Pittsburgh, Pa. Filed Jan. 29, 1897.
 597,265. Controller for Electric Motors. Charles S. Cook, Pittsburgh, Pa., assignor to the Westinghouse Electric & Manufacturing Company, same place. Filed Jan. 2, 1897.
 597,033. Apparatus for Stating Time and Number of Telephone Conversations. Erich Kosanke, Carl Fuhrand Bruno Krause, Wilmersdorf, Germany, assignors to Heinrich Elchewede, Berlin, Ger. Filed July 5, 1895.
 597,032. Telephone-Exchange System. William W. Dean, St. Louis, Mo., assignor to the Bell Telephone Company of Missouri, same place. Filed Sept. 22, 1897.
 597,032. Calling Device for Telephone-Exchanges. Alexander E. Keith, John Erikson and Charles J. Erikson, Chicago, Ill., assignors to the Strowger Automatic Telephone Exchange of Illinois. Filed Aug. 20, 1896.

MISCELLANEOUS.

- 597,012. Graphite Rheostat. Edward W. Jewell, Chicago, Ill. Filed May 8, 1897.
 597,110. Insulating Trolley-Hanger. Edward J. Cook, Cleveland, O. Filed Dec. 2, 1897.
 597,224. Adjustable Switchboard. Henry H. Walker and Frank D. Walker, Philadelphia, Pa. Filed Sept. 23, 1897.
 597,573. Electric Searing Pen. Henry Green, Hartford, Conn. Filed April 15, 1897.

A New Telephone Company in New Orleans.

The People's Telephone Company has been chartered under the laws of Louisiana with domicile in New Orleans. It is backed by New York, Detroit and Louisville capital and will, it is understood, use the same system as that now in successful operation by the independent company at Detroit. The capital stock of the company is put at \$600,000, and it will charge \$36 to \$42 per instrument, or about one-third less than the charges of the Great Southern Telephone & Telegraph Co., which has at present a monopoly of the telephone business in New Orleans. The *Times-Democrat* states that "the plans of the new company have been in hand for more than four months, and various Northern cities where this system has been in successful operation for many years have been visited and much valuable information secured; and having the necessary money behind them, the members of the new company are ready to begin business as soon as permission is secured from the city council to put its wires underground in accordance with the recent ordinance." The charter officers are as follows: George N. Norton, president; William P. Curtis, vice-president, with a secretary and treasurer to be elected at the first meeting of the board of directors, which is composed as follows: George N. Norton, Franklin Everhart, J. M. Billups, Jr., Brainard Rorison, George A. Beaton, William P. Curtis, S. P. Walmsley, A. T. Moss and Frank P. Mullen. Messrs. Norton, Everhart and Billups are New York capitalists. Mr. Rorison has been in New Orleans for many years as manager of the Barber Asphalt Company, and has also been interested in the drainage company. Mr. Beaton is a Detroit capitalist, and will be general manager of the new concern. Messrs. Walmsley and Moss are well known among New Orleans business men. Mr. Mullen has been resident general manager of the Barber Asphalt Company for some time.

The *Times-Democrat* was informed by one of the officers of the company that already subscriptions for the new telephones were coming in rapidly and the members of the company had every reason to expect success.

The fight which has been waged in New York city against the New York Telephone Company by its subscribers for lower rates equivalent to those charged for like service in other large cities in this country and Europe is to be continued. A bill for a \$125, instead of the present \$240 rate, and with the provisions of the Brush bill of last winter, is being prepared by the Board of Trade and Transportation Committee on Telephone Legislation, and it will be offered in the State Senate at an early day. Simon Sterne, who has been energetically urging action against the telephone company to establish the legal status of the corporation and its subscribers for the benefit of all interested, is looked upon as the leader in the fight, and he is as determined as ever.

The Spottswood Telephone Company, who are the owners of the line between Lexington and Staunton, Va., are making extensive improvements on their system. A switchboard will be put in at Raphine, midway between Staunton and Lexington, and a third wire put up for commercial business, and thus remove much of the annoyance now experienced by interruption to communication between the two places. This company is now extending its present system to other points in Augusta and Rockbridge counties. A nine-mile line from Raphine to Zack and a branch line to Brownsburg are in process of erection, and work is also progressing on the line from Raphine to Moffett's Creek and vicinity.

The first thing the Delmarvia Telephone Company did when it started into business in Wilmington, Del., where it has secured 800 subscribers, was to make a big reduction in the price of telephones, placing one in a private residence for \$24 a year and one in a business place for \$36 a year. The old company (Delaware & Atlantic Telephone & Telegraph Co.) had been charging from \$40 to \$90, but now announces that it will give a liberal rebate on all bills. This rebate is so great that the 'phones of the old company can be secured for the same price as those of the Delmarvia. The fight has resulted in many persons subscribing to both companies. The service is so cheap that clerks, small shopkeepers, cigar dealers and barbers are ordering 'phones placed in their homes and places of business.

The Augusta (Ga.) Telephone & Electric Company at its annual meeting on the 5th inst., elected these officers: President, Paul P. Verdery; secretary, P. S. North; manager, Paul Langdon; superintendent, Lee Campbell. The company uses the Strowger 'phone and has 436 instruments in operation in Augusta. The *Chronicle* says the company has met with wonderful success and is a home enterprise that the people are proud of.

Mr. Keezel has introduced in the Virginia House a bill to incorporate the Rockingham Mutual Telephone & Telegraph Company.

Another Successful Independent Telephone Exchange.

The Corry Telephone Exchange, Corry, Pa., is a bright and prosperous example of what pluck, perseverance and enterprise can do when joined to expert knowledge of the matter in hand. It has been successful from the beginning, and although the system is a comparatively small one, the exchange has been conducted with such skill and economy as to make it a paying concern. The exchange was started about two years ago by A. S. Keating, who for years had been engaged in experimental electrical work, and had already secured several valuable patents on electrical appliances connected with telegraph, telephone, arc light and dynamo construction. Mr. Keating conceived the idea of putting in a popular priced telephone system in Corry, manufacturing the 'phones himself, and the results have justified his enterprise. He had the opposition of the Bell company to contend against, but this did not deter him from going ahead, and his exchange has now so far distanced that of the Bell that it is recognized by all as the only real telephone exchange for local purposes in Corry. The telephone used by the company is the Keating telephone, which is not only a handsome instrument but a thoroughly efficient one, giving entire satisfaction. The rates charged by the company are \$24 per year for business and \$18 for residences. The officers of the Corry Telephone Exchange are: E. L. Keating, proprietor; A. S. Keating, general manager, and L. K. Keating, the manager's son, electrician.

The *Chattanooga Times* says: "There is a movement on foot to establish a new telephone company in this city, and in all probability the city council will be asked for a franchise at its next regular meeting. It is understood that several well-known citizens are financially interested in the scheme and that they will lend their influence to secure the franchise from the city council. In conversation with a *Times* man yesterday one of the 'interested' gentlemen stated positively that a new company is now being organized and that the promoters would make the city a liberal offer for a franchise."

An independent telephone company is being formed at Danville, N. Y., for the purpose of giving the citizens of the town the use of the telephone at much lower rates than those of the Bell company now in operation there. The new organization will be similar to the recently formed Business Men's Telephone Company of Nunda and connections by wire will be made with that and other towns of the county as soon after construction of the Danville line as practicable.

J. B. Norris, the veteran telegrapher, who has for years been the chief night operator at the Chattanooga office of the Western Union, has been appointed manager of that office to succeed the late E. C. Dunn. Mr. Norris learned the art of telegraphy in the fifties, and during the war he was in the field in Grant's command with Gen. Thomas Eckert, now president of the Western Union Company. He has been connected with the Chattanooga office twenty-five years and has always enjoyed not only the confidence and esteem of the employees of the office, but of the entire business community.

Long distance telephone connection has just been completed from Watertown to Ogdensburg, Canton and Potsdam, N. Y., taking in all stations north of Jefferson and St. Lawrence counties. The Central New York Company has spared no expense in erecting the new lines, and everything is of the very best material and workmanship. The towns and villages in Northern New York are now in communication with Utica, Syracuse, Rochester, Buffalo, Albany, New York and all long-distance points.

The Railway Commissioners of North Carolina have made a sweeping reduction in yearly telephone rates of rental to go into effect February 1. On and after that date the rates are to be as follows: Business telephones, special wire, \$30; two and three party wire, each, \$24; four and five party wire, each, \$18. Residence telephones—special wire, \$18; two and three party wire, each, \$16; four and five party wire, each, \$14. These rates do not apply to service outside the corporate limits of any city or town.

The North Carolina Railroad Commission still has under consideration the advisability of withdrawing the case of the Western Union Telegraph Company, relative to a reduction of telegraph rates, from the United States Court. This, the counsel for the telegraph company states, is the reason they wanted additional time in which to file the pleadings in reply to the answer of the commission.

The Western Union Telegraph Company has completed its connections with the Mexican lines that have recently come into its possession, and messages can now be sent direct into the heart of Mexico from New York. The total length of the circuit is about 4,000 miles.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted.

b Company controls Citizens' Railway, North Baltimore Passenger Railway, Baltimore & Curtis Bay Street Railway, Baltimore & Powhatan Railway, Pimlico & Pikeville Railway and Wallbrook, Gwynn Oak & Powhatan Railway and Park.

c Owned by Brooklyn Rapid Transit Company.

d Leased to Brooklyn Heights Railroad Co., which guarantees 10 % on capital stock.

e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Heights Company.

f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.

g Owned by Atlantic Ave. RR. and leased to Nassau system.

h \$30 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.

i \$20,100 of stock owned by North Chicago Street Railroad Company.

j Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.

k 1 1/2 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$25,100 of stock owned by West Chicago Street Railroad Company.

l Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,000 stock guaranteed by West Chicago Street Railroad Company, lessee.

m Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding.

a Leased to New Orleans Traction Company at 6 % on stock.

b Leased to New Orleans Traction Company at 8 % on stock.

c Leased to Central Crostown Railroad at 8 % on stock and interest on bonds.

d Operating the former Met. Trac. system, that corporation having become extinct.

e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.

f Leased to Houston, West Street & Pavonia Ferry—now Metropolitan Street Railway.

g Leased to Metropolitan Street Railway at 8 % on stock until Oct. 1, 1897; thereafter 9 %

h Leased to Metropolitan Street Railway for 99 years from Jan. 1, 1896, at \$215,000 per annum.

i Leased to Met. St. Ry. for 99 years from April 20, 1892; 6 % first 5 years, 8 % thereafter

j Leased to Metropolitan Street Railway for 18 percent on capital stock.

k Leased to Metropolitan Street Railway for 18 percent on capital stock.

l Dividends of 1 1/2 % yearly guaranteed by Consolidated Traction Company.

m Controls by lease the Allegheny, Cent., Citizens, Duquesne, Fort Pitt and Pitts'h Trac. Co.

n Leased to Consolidated Traction Company for 8 % per

PASSENGER RAILWAYS.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 10½@10½c.; Lake, 10½@11c.; cast ing, 10½@10½c.

The Columbus (O.) Street Railway Company has declared a dividend of 1 per cent., payable February 1.

The Consolidated Car Heating Company, Albany, N. Y., has declared a semi-annual dividend of 1½ per cent., payable February 15.

The Postal Telegraph & Cable Company has decided to expend \$1,000,000 on the extension of the company's system in the West and Southwest.

The Edison Electric Illuminating Company of Boston has declared a regular quarterly dividend of 1½ per cent., payable February 1. Books closed January 15, reopen February 2.

By a vote of the trustees at Boston on the 14th inst., 1,070 shares of the preferred stock of the Street Railway & Illuminating Properties were drawn for redemption, leaving 2,559 shares outstanding.

The Bramley bill repealing the Rogers 50 year franchise law, which had passed the Ohio House, when brought up in the Senate met with strong opposition and was finally referred to a committee of five to report at an indefinite time in the future.

The aggregate receipts and expenditures of all the lines operated by the Pennsylvania Traction Company of Lancaster, Pa., during the year ending December 31, 1897, were: Receipts, \$198,770.70; expenditures, \$189,046.19; credit balance, \$9,724.51.

Owing to the interest taken in Toronto Street Railway stock the company have decided to issue a daily bulletin of earnings, the same as that issued by the Montreal Street Railway. Each day these will be telegraphed to Montreal and will be posted in the Montreal Stock Exchange.

The Albany (N. Y.) Street Railway Company reports for the quarter ended December 31, 1897: Gross earnings, \$157,987; operating expenses, \$102,725; net earnings, \$55,262; other income, \$598; total income, \$56,070; fixed charges, \$24,963; surplus, \$31,107. In 1896 the surplus was \$34,729.

Hirsch Brothers & Co., bankers of Chicago and New York, have awarded to Louis K. Enright of Chicago the contract for the construction of twenty-eight miles of electric railway between Carson City and Cripple Creek, Col. The road is to cost \$1,000,000 and will be completed in four months.

The West Orange (N. J.) Electric Company has concluded a deal by which it has come into possession of the entire property of the Orange Mountain Traction Company, including the cable road up the mountain side, which has stood idle for a year and a-half. The West Orange Company will equip the road with new steel cables and expects to open the line for traffic before the end of February.

The fifty-sixth semi-annual volume of the "Financial Chronicle," containing weekly issues of the last six months, is now ready for delivery. It contains also the quarterly issues of the investors' and the street railway supplements, the semi-annual supplement relative to State and city securities, and the monthly quotation supplement, the whole making a book of about 2,500 pages.

The Columbus (O.) Street Railroad reports gross earnings for December of \$56,276, an increase of \$3,753 as compared with the same month of the previous year, and net \$31,242, an increase of \$4,698. For the year ending December 31 the gross earnings were \$609,681, a decrease of \$20,220 as compared with the corresponding period of the previous year, and net \$322,805, an increase of \$1,349.

Among the bills introduced in the House at Trenton, N. J., on Monday last were three by Mr. Bauer: Providing for five cent fares over all connecting trolleys or other street railways in first-class counties; requiring all street and trolley cars to be equipped with heating and ventilating apparatus under penalty of \$100 fine for each day's violation; requiring street and trolley companies to maintain waiting rooms and transfer stations under penalty of \$50 for each day's violation.

The North Chicago Street Railroad Company earned last year 14.47 per cent. on its capital stock, against 15.07 per cent. in 1896. There was a slight reduction in the passenger receipts, but this was about offset in a cut in operating expenses. In the item of charges, including railway rentals, taxes, interest, insurance and loss on World's Fair stock and Connelly motors, there was an increase of a little over \$100,000, the amount in 1896 being given as \$524,231 and this year as \$636,462.

The proposition that the Union Traction Company of Philadelphia made to the Hestonville, Mantua & Fairmount Passenger Railway Company was as follows: "The Union Traction Company agrees to lease the Hestonville road for a period of 999 years, from January 1, 1898, at a net rental of 6 per cent. on the preferred stock and 4 per cent. on the common stock, free of tax, payable in gold semi-annually, in July and January." A meeting of stockholders of the Hestonville road is called for January 27 to vote on the lease.

The Boston Board of Gas and Electric Light Commissioners have authorized an issue of new stock by the Boston Electric Light Company to the amount of \$800,000, for the construction and equipping of a new central station, etc. The order provides that the sum shall be applied to the payment of liabilities incurred since December, 1897, or which may be incurred hereafter for the purchase of additional real estate, the building of a new generator station thereon, the equipment of the same, connecting them with the other stations of the company, the purchase of additional machinery and apparatus for use in said station, or in connection therewith, and for no other purposes. The market value fixed for the stock, and at which the stockholders must take it, is \$100 per share, and if there is any stock left after the stockholders have taken what they are entitled to take, it shall be offered to the public at some place in the city of Boston.

At the annual meeting of the stockholders of the Springfield (Mass.) Street Railway Company on the 12th inst. it was voted to increase the capital stock by an issue of 3,000 shares, which, according to the probable rate of sale, means an increase of \$150,000. The increase is directly made necessary by the need of \$300,000 with which to pay for the road building and extensions of 1897. "It is not anticipated," says the Springfield "Union," "that the increase in capitalization will in any way affect the usual dividends of the year, as calculations of increased earnings corresponding with expenses are made. At the ratio of an 8 per cent. dividend, which it has been customary for the company to declare in the past few years, holders of shares of the new issue, supposing that they pay for the same \$150, may expect to receive dividends for the year of about 5½ per cent. The company has already issued a total of 11,667 shares, which, with the new issue, will give the capitalization close to \$2,000,000."

The Rapid Transit Commissioners met in New York on Monday last to receive the report of the sub-committee on contract, which for several weeks has been trying to plan some method of getting a bidder for the proposed underground road. President Orr, who is a member of the sub-committee on contract, said before the members went into secret session that the report was a long one bearing upon the capacity of the Commission to proceed with the work in the face of the decision of the Appellate Division of the Supreme Court requiring the contractor to give a bond of \$15,000,000 for the faithful performance of the work. "The report," said Mr. Orr, "recommends that our lawyers go before the Appellate Division of the Supreme Court and ask the Justices to interpret their recent decision to mean that the big bond be given only for the period of actual construction of the road, and not for the fifty years in which the road is to be operated for the city by the contractors."

EDITORIAL NOTES.

Electricity and Trunk Line Railroads.

The impression that has all along more or less prevailed, that electricity could be economically applied to heavy railroad traffic, has been fostered to a great extent not only by sensational newspaper articles, but, sad to relate, by contributions that have appeared from time to time in various technical magazines, written by fairly well known engineers. There is not the slightest doubt but what in some cases electricity can be advantageously substituted for steam, as for instance in mill work, where numerous small machines are being driven by shafting; but when it comes to equipping a trunk line railroad with electricity the interest on the large sums of money that would have to be invested in copper and in building power stations would be considerably greater than the cost of the fuel saved. The New York *Sun* recently published an interview with an electrical engineer who refers to this matter as follows:

"The real reason why the electric locomotive does not at once take the place of the steam motor is the difficulty and cost of distributing the electric current for long distances without a great loss of current through the electrical resistance of the wires. To overcome this the roads operated by electricity are divided up into short sections, and separate copper feeder wires are run from the power house to each section. This would not entail so much expense if it were not for the fact that each feeder wire as it is increased in length must also be increased in size, or there would be a great loss of power, and the cost of the copper soon gets to be too great to warrant the increase in size. When the scheme for building the Broadway underground rapid transit railroad was being investigated by a Supreme Court commission in 1895 experts testified that to transmit the enormous amount of power which would be required for the proposed train service would take \$7,000,000 worth of copper wire alone if the power all came from one station."

The above statement exactly covers the point in question. Regarding the Broadway underground rapid transit railroad mentioned, it would naturally be more economical to construct several power stations and thus reduce the distance a wire would have to run and consequently the resistance; but in the case of a railroad, say one hundred miles in length, a large number of stations would have to be built at short intervals apart and at great expense, or an immense amount of copper used at an enormous cost. Referring to the impracticability of operating long lines by electricity, the article previously referred to says:

"With the present equipment it seems that 500

or 600 volts at most is the limitation of the direct current motor, and long lines can only be operated by placing power stations at frequent intervals, say ten or twelve miles apart. The transmission at this voltage involves enormous losses or great expense for copper. On one road recently tested the voltage varied from 525 volts near the station to 240 volts at the end of a line seven miles distant. It is obvious that for transmission alternating currents must be employed. How necessary high voltages are may be seen from a little calculation on the cost of copper for line wire. Mr. Stillwell gives the cost of copper required to deliver one horse power at motor shaft ten miles from the generator, allowing a 20 per cent. drop and copper 15 cents per pound, at 500 volts, \$780.75, and at 10,000 volts, \$1.95. Thus it is seen that it costs 400 times as much to furnish copper at 500 volts as it does at 10,000."

Take for example the New York-Philadelphia section of the Pennsylvania Railroad. If this company desired to operate the road by electricity, running daily the same number of passenger trains at the same horse-power that are at present being run, the cost of copper, were the line operated from one power station with a direct current at a pressure of 500 volts, would be about \$50,000,000. Of course it would be absurd to undertake to operate such a line with but one central station (or with any number for that matter), but the above figures give some idea of the impracticability of such a proposition. If an alternating current of 10,000 volts were generated at stations, say twenty miles apart, along the line, and this alternating current were transformed at short intervals into a direct current of 500 volts, which would necessitate the placing of a large number of transformer stations all along the road, the cost of copper would amount to not less than \$600,000. The cost of five central stations of 2,500 HP. each would not be less than \$625,000, and twenty-five transformer stations of 1,000 HP. would probably cost in the neighborhood of \$125,000. This would make as the total amount \$1,350,000 that would have to be expended were the same number of passenger trains (about seventy a day) to be operated by electricity as are now being run by steam, taking as an average 500 HP. per train. We have purposely refrained from taking into account the freight traffic, which would necessitate considerably more copper and larger central stations, and have confined ourselves exclusively to the passenger service, assuming that there might at certain hours be as many as twenty-five trains on the line at one time. The interest at 5 per cent. on \$1,350,000 would amount to \$67,500 a year. This sum would have to be more than offset by the annual saving in fuel in order to make the electric system a success financially. Assuming a locomotive burns coal at the rate of 5 lbs. per horse-power hour for three hours in making a trip from New York to Philadelphia or vice versa, the total

amount of fuel consumed annually, were seventy trains of 500 HP. each run a day, would be 85,519 long tons. At \$3 a ton the coal item would amount to \$256,557 a year. With electricity as motive power, the five central stations would be obliged to operate at their full capacity during nineteen hours out of the twenty-four. With but two pounds of coal consumed per horse-power hour, the total amount of fuel burned per year would be 77,380 tons. Figuring this at \$3 per ton, the annual coal bill for generating the necessary electric current would be \$232,140. There would therefore be an annual saving were electricity adopted of \$24,417 in fuel. But the interest on the capital which it would be necessary to invest to effect this saving of \$24,417 amounts to \$67,500. There would therefore be an annual loss of \$43,083, to say nothing of the extra amount of labor required in operating the five power stations and inspecting the working circuits on ninety odd miles of track.

From the above figures it will readily be seen that the time is not yet ripe for the substitution of the trolley or any modification of it for steam on trunk lines, or over long distances where the train service is infrequent. Mr. C. E. Yerkes summed this question up in a nutshell recently in the *Pittsburg Dispatch* as follows:

"I do not clearly see the finish, using a common slang expression, of the steam locomotive. It is a very perfect machine, and certainly no electrical invention has yet been made which will take its place for long-distance hauls. The present steam locomotive is far ahead of the present electrical locomotive. Of course the third-rail system has been used to advantage in short hauls, but for the long-distance strides over continents, as, for instance, this limited train of the Pennsylvania Railroad, the electric locomotive is as yet only a dream."

Great things are expected of the alternating-current motor in the near future, but even were this apparatus adapted for railway work, which it is not at the present time, there is no certainty that a trunk line railroad could be operated more economically even then by electricity than by steam when the extra labor item is taken into account.

At the present state of the art electricity can unquestionably be advantageously applied to special cases, but if we overstep the boundary by which we are confined we are simply wasting energy and money to no purpose.

* * *

Several New Illuminants. The old saying that it never rains but it pours would seem to apply admirably to inventions. A wonderful illuminant recently made its appearance in Germany, and two such inventions are now attracting attention in this country. Mr. D. Macfarlane Moore, of Newark, N. J., is said to have solved the problem of vacuum-tube lighting without shadows. A test was recently made of this method of illuminating which would seem to prove conclusively that the light was under thorough control and could be so regulated as to give any desired degree of intensity—from a soft, clear light resembling that given off by the moon to an intense glare by which photographs could readily be taken. The principal advantage claimed by the inventor for this improved method of vacuum-tube lighting is that it diffuses itself evenly throughout a room and does away with the objectionable flicker. As is well known, a vacuum-tube light is generated by the action of electricity upon the particles of ether in a tube. For many years scientists have been endeavoring to turn this principle to practical use, but it has been found extremely difficult to do so. Mr. Tesla has done considerable work along this line, and a few years ago succeeded in obtaining a vacuum-tube light by the aid of which he was enabled to photograph various objects. Mr. Philip N. Jackson, of Newark, refers to Mr. Moore's invention in one of the local papers as follows:

"At the Electrical Exposition in New York in 1896 I saw the light, and it was the nearest counterpart of daylight I ever saw. Mr. Moore is a remarkably bright young man. If he has succeeded in perfecting vacuum-tube light so that it will be practical he has achieved a great thing.

"Scientists, electricians and all electric-light people agree that the light of the future will be a steady and diffused light with no flicker, instead of the spot lights now in use. Of course, I do not know whether Mr. Moore has succeeded in solving the problem so that his light is cheap and practical, but if he has he will win fame and fortune.

"A practical vacuum-tube light would be of great value to electric light companies, for the power for Mr. Moore's light is generated as we generate power for our light. If he has succeeded, his light will make a wonderful change in all illumination."

At the coming Electrical Exhibition, to be held in Madison Square Garden next May, Mr. Moore expects to demonstrate to the public the practicability of his vacuum-tube light by illuminating the arches and stained-glass windows of a specially-designed Gothic church. If, as Mr. Jackson states, this light can be generated economically, there would seem to be no reason why it should not be universally adopted and prove a benefit to mankind.

The other new illuminant which we referred to above has lately been invented by Mr. S. N. Nickum, of Logansport, Ind., and if we are to believe all the newspaper reports regarding it, it would certainly seem to be a wonder. The *Chicago Tribune* describes the light as follows:

"As near as can be learned, the new light is a product of some chemical action hitherto unknown. It is given off, according to the tales of eye-witnesses, from round glass globes sealed up from the air and apparently disconnected from every possible source of illuminating energy. These globes can be carried anywhere desired, exposed to light or darkness, heat or cold, all without changing the steady illumination from within. They are made in sizes ranging from that of a small egg up to the dimensions of an arc light covering. Some are dim and soft, being a fraction of a candle power, while others glow with the brightness of an Argand burner. Any color of glass in the globes may be used, and thus hue, size and brilliancy may be completely at the control of the manufacturer. And as long as the globe remains intact the light is declared to endure in its original brightness."

The inventor has up to the present time carefully kept secret the combination of chemicals which it is claimed he uses. Many persons think Mr. Nickum has solved the problem as to how phosphorescence is produced, and discovered the chemical action which takes place during its continuance. The principal cause that has led to this belief is the fact that only the slightest discernible rise in temperature accompanies the giving off of the light.

The claim which the inventor makes, to the effect that the light once started will never go out so long as the glass bulb in which the chemicals are located remains intact, would seem more or less absurd. The giving off of light must necessarily be the result of some action which the chemicals in the tube are undergoing, either in combining or in being decomposed, and such being the case it is difficult to see how such an action could keep going on indefinitely without ultimately exhausting one or all of the chemicals. If Mr. Nickum can do what he claims, he has certainly succeeded in accomplishing something that no one else has ever been able to secure, namely perpetual action, which is the next thing to perpetual motion.

Several daily papers with their usual sensational gusto have intimated that this new illuminant may be the death knell to gas and electric lighting companies throughout the country, but we scarcely think stockholders in the latter organizations need be in any hurry about ridding themselves of their securities.

The Milwaukee Convention. The Milwaukee meeting of the Northwestern Electrical Association, to which we devote considerable space in this issue, was a complete success from every point of view. The attendance was large, forty-six applicants for membership were admitted, and a number of valuable papers were read. The discussions were conducted in an admirable spirit and the members who took part in them seemed to be actuated by a desire to learn as well as to instruct. The attention this organization continues to attract in all parts of the country indicates a healthy growth and fast-spreading influence.

Under the Searchlight.

Notes and Comments on Various Topics.

A Westinghouse Inspiration?

In a long article entitled the "Tammany Rapid Transit Deal," which recently appeared in the *Philadelphia Press* and which was subsequently copied in the *New York Post*, the various steps that presumably led to George Gould deciding to equip the Manhattan Elevated Railroad with electricity are set forth. The writer of the article hints at an all-around deal having been made between Tammany as represented by Mr. Richard Croker, Mr. Gould, representing the interests of the Manhattan Elevated Road, Mr. Whitney for the Metropolitan Street Railway Company, and the various political members of a certain Cleveland electrical manufacturing company. According to the writer of the article referred to, the killing of the underground rapid-transit scheme and Mayor Van Wyck's recommendation in his first message regarding the Elevated Railway system were all arranged at Lakewood between Mr. Croker and Mr. George Gould. This long-winded article intimates that a subsequent deal was made with the Cleveland company by which it was to get the contract for installing the electrical apparatus for a small consideration in stock, which latter was to be distributed among a few of the Tigers. The tone of this article would seem to be somewhat on the sour-grape order. The effusion referred to ends as follows:

"The mechanical engineers say that there may be complications in case the contract is awarded to the company controlled by this group of politicians, for these engineers declare that it will be impossible to equip the elevated structure with electricity without employing some of the apparatus invented by Tesla which this company does not control. It cannot use these patents, it is asserted, without making itself liable to suits for infringement, unless it buys the right to use them. Perhaps it has made contracts for such use. If so, it, of course, will escape the embarrassments of litigation. There are some men on Wall Street who wonder whether this is not after all a brilliantly arranged plan for inducing the public to buy the shares of the corporation, and yet if the corporation secures one contract involving the payment of ten millions, or thereabouts, there is no reason why the public should not receive in the way of good dividends its share of the profits which are in the contract."

* * *

An Overdone Specialty.

There are twelve different concerns engaged in the manufacture of rheostats as a specialty in this country. The first one began business in June, 1892, less than six years ago. It is evident that there is not room enough for more than two or three concerns in such a limited line. This is a good illustration of how the electrical manufacturing business has been overdone in the last few years.

It looks as though a fight to the death has started in, as nearly every one of these concerns is suing or being sued under alleged controlling patents, and now the prices are reduced so that a 1 HP. automatic

rheostat can be purchased in the open market for \$3.50. Three or four concerns who have entered this field have quietly subsided, and it looks as though many others would be obliged to soon follow suit. Economical secret processes are really the only protection under such conditions, as patent litigation is so uncertain and expensive and long drawn out that it offers no sufficient protection, and the reductions in price in the struggle for existence leave the industry crippled for years to come.

The rheostat business is not by any means the only line overdone in this way. "There are others."

* * *

A TIMELY DECISION.

Is It to be Brought to Bear on the Manhattan Contract?

Judge Wheeler of the United States Circuit Court handed down a decision on January 24 sustaining the validity of the electric railway motor suspension patent, which is controlled by the General Electric and Westinghouse Companies, and ordering an injunction against the Union Railway Company of this city and the Walker Company of Cleveland, Ohio.

The Union Railway is commonly known as the "Huckleberry Road," in which Mr. A. W. Brady, of the Walker Company, is largely interested. The decision has little or no significance, as the case will unquestionably be carried to a higher court.

* * *

In the issue of January 20 of the *Electrical Engineer* there appeared a lengthy illustrated article describing the new station of the Edison Electric Company of New Orleans. The names of the officers of this company were given in this article, but the names of most of the directors of the company were withheld. It may interest our readers to learn that most of the stock of the above organization is owned by the General Electric Company, and we presume the latter has adopted this method of drawing public attention to the plant as a preliminary step in a contemplated booming process.

* * *

THE *Commercial America*, New York, in its issue of January 21 says:

It may startle investors in electrical securities somewhat to learn that the owner of a prominent machine works in this country states that he recently attempted to make electric motors, first for his own use, then for the trade; but the best he could do was to produce them at nearly double the cost of the motors in the open market. In other words, these large and well-fitted-up machine works were forced to the conclusion that there is not only no money in such business, but actual loss. Interviews on this head with other machine supply establishments corroborate the opinion above expressed, it being added that they thought the big electric manufacturers are forcing the smaller firms to the wall deliberately to destroy competition.

Another manufacturer stated: "It is the natural result of over-production, or of there being in existence more motor manufacturers than there are buyers for output. We do not see any more in this cutting of prices than the usual supply and demand for motors. At the same time, we confess that motors are being sold to-day at a price which those not in the business can see no profit in. Of course, if these motor manufacturers have some secret by which they can produce motors at 33 or 50 per cent. less cost than can outside machinists this criticism has no point or application."

The great secret referred to in the last passage of the above article is that some electrical companies manufacture not only machinery but stocks and bonds as well. Such being the case it matters little to them whether a profit is made on their electrical apparatus so long as their other commodity finds a market. Whenever the General Electric Company stops carrying on a stockjobbing business, the price of its dynamos and motors will necessarily go up and smaller concerns will then stand some show.

We would call attention to the recent loss met with by the Sterling Remedy Company of Attica, Ind. Owing to a fire which broke out in one of the packing rooms, the building in which the offices of the company were situated was totally destroyed.

This misfortune, however, only served to stimulate the management to greater effort, with the result that it was only a few hours after the fire started before the company was again carrying on business as before in a new set of offices. The record of this company would appear to be something phenomenal, for according to the annual report of the board of directors there were over 3,000,000 boxes of cascades sold during the year 1897, and it is stated that there are good prospects of doubling this business during the present year.

WASHINGTON NOTES.

Representative Wheeler of Alabama has introduced a joint resolution to fill one of the vacancies in the Board of Regents of the Smithsonian Institution by the appointment of Alexander Graham Bell to succeed Gardiner H. Hubbard, deceased.

Mr. Wheeler has also introduced a bill providing for the establishment of the Morse Memorial Conservatory of Electricity; the bill also provides that the commissioner of promotion having the matter in charge procure from each State, by public or private contribution, a fund sufficient to provide one perpetual free scholarship in the Conservatory.

National Association of Manufacturers.

We called attention in our issue of the 5th inst. to the banquet of the above Association, which is to take place at the Waldorf-Astoria Hotel on the evening of the 27th inst., and in advance congratulate those of our electrical friends to whom an invitation has been extended, for they will meet there a company of bright, able men whose names are intimately connected with the manufacturing and commercial progress of the country. President McKinley is expected to be present and to speak.

The National Association of Manufacturers was formed in 1895 and now embraces in its membership 1,000 of the largest manufacturing interests in the United States. Its chief object as set forth in a pamphlet issued by the "Bureau of Publicity" of the Association are: The conservation of the home market; creation of a Federal Department of commerce and industry; improvement of patent laws; unification of railroad freight classification; enactment of a uniform bankruptcy law; improvement of internal waterways; investigation of foreign markets; establishment of sample warehouses; improvement of the Consular service; restoration of the American merchant marine; restoration of treaties of reciprocity.

An annual fee of \$50 entitles a manufacturer to membership and to all the privileges incident thereto during the period of twelve months from the date of payment. Only manufacturers are eligible for membership.

Electric Light Dimmers.

Electric lights for household use have always heretofore been open to the objection that they could not be turned down without putting them out. Recently this objection has been overcome and a number of manufacturers are now offering for sale sockets for incandescent lamps which enable a person to regulate the amount of light produced within wide limits.

These sockets can be put in place of the ordinary ones with little trouble or expense, and the light given out by the lamps which they carry can be regulated as readily as can a gas jet. This result is attained by the introduction into the socket of coils of fine wire which act as resistance coils. In one style of these sockets there are five of these coils and the light of a sixteen candle-power lamp can be reduced by two or three candle-power jumps down to two candle-power. The work of a resistance coil is to absorb some part of the electrical current which seeks to pass through it, allowing only the remaining force to act upon the carbon filament of the lamp to produce heat and consequently light.

Lamp Company in Trouble.

As we go to press it is rumored that a Boston Lamp Company is in trouble.

THE SIXTH ANNUAL CONVENTION OF THE NORTHWESTERN ELECTRICAL ASSOCIATION.

The Sixth Annual Convention of the Northwestern Electrical Association was held in the club room of the Hotel Pfister, Milwaukee, Wis., January 19, 20 and 21.

The Convention was called to order on the 19th at 11 A. M. by the President, Mr. H. C. Higgins, of Marinette, Wis.

The roll was then called by the Secretary and the following were announced as present:

H. C. Higgins, Marinette, Wis.
Henry L. Doherty, Madison, Wis.
B. H. Strong, Baraboo, Wis.
S. B. Livermore, Winona, Minn.
Fred D. Nims, Muskegon, Mich.
E. W. Buss, Chapman Valve Mfg. Co., Chicago.
E. L. Draffen, Chicago.
W. L. Church, Milwaukee.
W. P. Bragg, Monroe, Wis.
H. T. Pearce, Negaunee, Mich.
J. L. Schlacks, Freeport, Ill.
F. A. Copeland, LaCrosse, Wis.
Adolph Hamacek, Sturgeon Bay, Wis.
Pliny Norcross, Janesville, Wis.
M. B. Austin, Chicago.
Frank Kellogg, Spence, Ill.
E. A. Upham, Marshfield, Wis.
T. A. Pamperin, Oconto, Wis.
George A. Davis, Neenah, Wis.
R. T. Schuchardt, Chicago.
Charles S. Kehler, Milwaukee.
C. C. Paige, Oshkosh, Wis.
Alex. Dow, Detroit, Mich.
L. E. Kerns, Madison, Wis.
Frank L. Perry, Chicago.
W. P. Upham, Chicago.
George L. Mayer, Belle Plaine, Ia.
G. W. Patterson, Chicago.
J. H. Harding, LaPorte, Ind.
Edward R. Grier, Chicago.
George S. Searling, Chicago.
A. A. Cross, West Superior, Wis.
C. E. Van Bergen, Duluth, Minn.
J. D. H. Ralph, Owosso, Mich.
A. W. Foster, Chicago.
George S. Whyte, Chicago.
James R. Dee, Houghton, Mich.
Fred DeLand, Chicago.
C. T. Gage, Chicago.
W. Worth Bean, St. Joe, Mich.
W. Worth Bean, Jr., St. Joe, Mich.
A. B. Conover, Chicago.
H. O. Channon, Quincy, Ill.
E. H. Hammond, Chicago.
W. W. Low, Chicago.
R. E. Lucas, Marion, Ind.
George P. Rex, Chicago.
L. W. Burch, Madison.
F. L. Hogg, Madison.
John T. McRoy, New York and Chicago.
A. L. Tucker, Chicago.
A. M. Little, Chicago.
W. S. Troll, Big Rapids, Mich.
E. L. Debell, Sheboygan, Wis.
J. B. Morrill, Evanston, Ill.
C. W. Bacon, Madison, Wis.
O. P. Kissell, Hartland, Wis.
John B. O'Hara, Hartland, Wis.

The following additional attendants were registered on the 20th inst.:

A. C. Langstadt, Appleton, Wis.
F. G. Kurz, Appleton, Wis.
Otto Langstadt, LaCrosse, Wis.
C. A. Ross, Chicago.
C. E. Kaumeyer, Chicago.
H. J. Gille, St. Paul.
P. H. Korst, Racine, Wis.
W. F. Collins, Wausau, Wis.
C. R. Gilman, Milwaukee.
Morgan Brooks, Minneapolis.
Irving P. Lord, Waupaca, Wis.
D. W. Jackson, Madison, University of Wisconsin.

After roll-call a motion was made, seconded and unanimously carried that the minutes of the Fifth Semi-Annual Convention be accepted as printed.

The President then read his address, an abstract of which is as follows:

PRESIDENT HIGGINS'S ADDRESS.

Fellow-members of the Northwestern Electrical Association: I greet you and bid you a happy New Year in this the sixth year of the existence of this

Association. I am pleased indeed to see so many of you present. It bespeaks a good Convention and as President of this Association I thank you one and all for your presence here to-day. I see that the supply man, God bless him! is quite in evidence, for which I am also thankful, for I think him the saving clause of this Association. I do not know what we would do without him, and I believe in electing him to full membership.

I am a believer in Associations and frequent Conventions, and the more frequent the better. The oftener we meet and compare ideas and exchange grievances the better, and I hope that this Convention may continue to grow and meet and meet and grow until it becomes so large that there will be no building in the State of Wisconsin large enough for it to hold its meetings in excepting our amphitheater at Marinette which we are now building, with a seating capacity of 4,000 people and a stage capacity of 150 people, as in that event you will hold all your meetings in Marinette.

I trust that you have all had a pleasant and prosperous year, and I judge from your countenances that such has been the case. I am glad to be able to state that but one death has occurred in our ranks during the past year, and no company which is represented in this Association has gone into the hands of a receiver within the past year except one, and that was only temporarily. There has been no State legislation enacted that I consider particularly offensive to our business, and so far as I can learn each of the committees appointed at our last January meeting have done their work well.

[Mr. Higgins here referred to the work of the inventors of electrical apparatus and paid a high tribute to their genius. He also alluded to the manufacturers in terms generally complimentary but occasionally sarcastic.]

They have invented and sold us the excellent products of their wonderful genius, and at excellent profits to themselves, but they have neglected one very important thing, that is, directions to us of how to operate the goods with profit to ourselves, which the hazard and annoyance and the necessary investment could justify—hazardous because of the many dangerous things that can take place in connection with our plant that would be ruinous to it, such as an opposition municipal plant or a serious accident causing many thousands of dollars, a disastrous fire, etc.; and while we do not want to condemn the electric lighting business, I will say that I see before me here the faces of many men who have been in the central station electric light business for years, some of them having grown gray in it, and I do not know of more than one or two instances where they have ever realized one dollar on their many years' investment; still the public think we have too many privileges and are getting rich through the business.

When we first went into the electric light business we paid \$25 a thousand for carbons; we paid one dollar each for incandescent lamps, seventy cents for sockets, and all other supplies necessary for the business at corresponding high prices, so that I think if we are let alone our business will be fairly remunerative for some time to come. The electric watt-meter has been an excellent thing for us, and I hope the time is near at hand when electric current will be sold only by meter.

One dangerous element that we have to look out for is the political schemer, who is always working "for the dear people," and the gas and electric light companies are destined subjects of his attack. All our legislative halls from Congress down to our own little municipalities have quite a sufficiency of this element. You may ask me for a receipt for treatment of him, but I must answer that I have none other than to meet him with good work and honest facts. Give the public good service and fair prices and courteous treatment and the battle is half won.

The street railway business has, I think, suffered more within the past two years than any other legiti-

mate business. Not only has the hard times worked against them, but the bicycles have taken a large percentage of their business. It is gratifying however to street car men to know that the expenses of operating as well as those of original purchase have been very much reduced. The reduced receipts have had much to do with the reduction in operating expenses, so that perhaps after all the reduced receipts have been a blessing in disguise, although the reduced receipts have not been the whole cause of our reducing expenses, for when we first went into the electric street railway business it was all an experiment from start to finish. Everything was new to everybody, and we who have had the putting of these appliances into actual operation and have had to furnish the capital to test and bring to successful operation the different electric street railway appliances which are now running so successfully, have, I think, had as hard a task on our hands as the gifted geniuses who invented and put together the many appliances which were sold to us as the best in the market, and sold to us, as you know, at enormous prices, and even at these prices we found them defective in many ways, and we had to improve them as best we could and do the best we could with them.

We all went into the electric street railway business with the greatest hopes of financial success. It was a very attractive business. The man who was running a horse car or a mule car line would go to a town where they were running the new electric street railway; he would see the beautiful cars, with every seat occupied by a passenger, gliding over the track without any apparent effort and at a more rapid rate than he had ever hoped to accomplish on his line, a uniformed conductor on one end, a uniformed motorman on the other, with everything bright and shiny—a beautiful sight to him,—and frequently he did not go home until he first visited the office of Mr. John I. Beggs or Mr. B. E. Sunny, whose bright, smiling countenance was only a continuation of the bright things he had seen in the electrical equipment at the last town at which he had visited, and got prices from each of these gentlemen for electrically equipping his road at once. He went home, consulted his board of directors the first day, explained what he had seen and some of the things he had felt, and that night sent a night message accepting the proposition of one of the two contestants before mentioned. We all thought in those days that about all that was necessary was to secure a favorable franchise and the electrical companies would do the rest, but I know of no writing that so fittingly applies to the case as a verse in one of Moore's poems which reads:

I saw from the beach when the morning was shining
A bark o'er the waters ride gracefully on;
And I saw from that beach when the eve was declining,
The bark was still there but the waters were gone.

The nickels which we had expected to have supported our enterprise had, like the waters, gone and left our bark, the street railway, stranded.

It is not to be wondered at that after these five or six years of experiments in the business, and with approved appliances, more efficient help, etc., we can reduce the operating expenses. Every appliance in the business has been an improvement on the first, and we have all contributed something towards this result, until the business has now become one of comparative pleasure to that which it was in its early history when we were trying to operate an electric road on a horse car track with inexperienced help, who, notwithstanding their incompetency, were high-priced and indifferent, for if they were not retained by you they were pretty sure of a job at the next town having a similar business. Our rail bonds were continually breaking, our track continually spreading and letting our cars drop to the ground, and no matter how well it was cared for the track was a constant annoyance. Our commuters were niggering and our motors short-circuiting, and on our very busy days these things seemed to combine to do their worst, or rather their best, to make

us miserable. Our days were restless and our nights sleepless, but by patience and persistence we have become masters of the situation, and I think if the writer was alive to-day who wrote the sentence, "He who makes two blades of grass grow where but one grew before is a benefactor," he would add, and he who carries two passengers where but one was carried before is also a benefactor.

As I have been through the poor track and poor car business, and as one of the pioneers in the street railroad park business, I feel that it is not egotism to say that I am competent to give some advice to my fellow-sufferers in that line. Do not use less than a 60 lb. steel T rail; use good sound tires not less than 6" wide, lay them two feet centers, and still closer is better; bond with not less than No. 0 bonds, use nothing less than 0 trolley wire, buy nothing larger than 16 to 20 ft. cars for general use, and you cannot make much of a mistake by buying the latest type of generators and car equipments from any of the leading companies making and selling such appliances. Do not, however, lay any extra line in order to establish a park, unless you can establish it on the edge of a body of water and have a town of not less than 30,000 people to draw from. Do not lay out much money on animals for your park. Do not run vaudeville or other shows unless you are so situated that their transportation will cost you but little. I believe that street-railway parks should be well enclosed and no one admitted unless they pay car fare each way, no matter whether they come by carriage or bicycle. I do not believe that any town of less than 25,000 people will support an electric street railway and give a decent return to its investors; although two towns aggregating a little less than that population and being some distance apart might be good paying properties, yet local conditions would have very much to do with this. I have known of towns of this size and seemingly about the proper distance apart, and without a cent of interest to pay and light taxes, almost no insurance and lying in the heart of a good coal district where they got their coal for almost the hauling, and although the road appeared to be well managed still it went into the hands of the receiver for sheer lack of patronage and is still in his hands, and the Lord only knows when it will get out of his hands.

And now in my closing remarks in relation to electric street railroading, while congratulating ourselves upon the pleasant side of the business, I would ask how long the restless brain or the genius of the nineteenth century, or even the twentieth century, coming and already on our threshold, will let us alone. How long will it be before they will have something better to offer us for transporting passengers than an electric street railway? We are already threatened with the airship and the horseless carriage. What will be accomplished in this line is mere guesswork. Let us hope, however, that at least we who are in the business to-day will get a much needed rest from any further experiments.

Gentlemen, I thank you for your attention. The next order of business is the report of the Secretary.

The Secretary and Treasurer then presented his report and it was unanimously accepted and adopted.

On motion of Mr. Debell the election of officers was postponed to a future session.

The Secretary then presented a numerous list of applications for membership, from manufacturing and supply companies and individuals, and on motion of Mr. Norcross the Secretary was directed to cast the ballot of the Association for the admission of the applicants.

PROGRAMME.

The following was the programme arranged for the Convention:

WEDNESDAY, Jan. 19—Morning Session—Convene 10 o'clock; roll-call; reading of minutes; president's address; report of secretary and treasurer; election of officers; election to membership; reports of committees; unfinished business; new business.

Afternoon Session.—Convene 2 o'clock.

Paper—"Practice of Theory." By John C. McMynn, of Illinois.

Paper—"Electric Lighting for Profit." By Alex. Dow, of Michigan.

Address—"Topics of Interest to Central Station Men." By Lieut. Francis A. Badt, of Illinois.

7:30 P. M.—Theater party.

THURSDAY—*Morning Session*—Convene 10 o'clock.

Paper—"Long Distance Transmission." By Axel Ekstrom, of New York.

Paper—"Present Efficiency of Incandescent Lamps." By John E. Randall, of Missouri.

Paper—"Physical and Chemical Properties of Volatile Oils in Boilers." By W. H. Edgar, of Illinois.

Afternoon Session.—Convene 2 o'clock.

Paper—"Electricity in Municipal Engineering." By Prof. R. B. Owens, of Nebraska.

Paper—"Municipal Socialism." By Fred DeLand of Illinois.

8:30 P. M.—Banquet. [The following is a list of the toasts and speakers: "The Badger State," response by Governor Scofield; "The Cream City," response by City Attorney Van Wyck; "The Electrical Press," response by Frank L. Perry; "The National Electric Light Association," response by W. Worth Bean; "LaCrosse and Hospitality," response by F. A. Copeland; "The Light that Failed," response by H. L. Doherty; "The Girls We Left Behind Us," response by H. G. Underwood; "Ourselves," response by W. W. Low.]

FRIDAY—*Closing Session*—Convene 10 A. M.

After the programme was announced the Convention adjourned to meet again at 2:30 P. M.

WEDNESDAY—*Afternoon Session.*

The session was called to order by the President at the hour set.

The President appointed W. W. Bean, chairman, H. L. Doherty and Pliny Norcross a committee to nominate officers and directors for the ensuing year.

The committee reported as follows:

For President—F. A. Copeland, of LaCrosse.

First Vice-President—James R. Dee, of Houghton, Mich.

Second Vice-President—P. H. Korst, of Racine, Wis.

Secretary and Treasurer—Thomas R. Meroein, of Milwaukee.

Directors—E. L. Debell, of Sheboygan, Wis., chairman; George L. Thayer, of Belle Plaine, Iowa; S. B. Livermore, of Winona, Minn.

On motion of Mr. Bean the rules were suspended and by unanimous vote these officers were elected.

Mr. Copeland, the new President, was then conducted to the chair and made a brief address in which he acknowledged the honor conferred upon him, spoke of the good that was being done by the Association, urged the members to increased efforts towards swelling the roll, and advised all engaged in the electric light and railway business to connect themselves with the Association.

Mr. Pliny Norcross, chairman of the Protective Committee, then presented the report of the committee, which was a statement of what had been done by it to prevent hostile legislation at Madison and elsewhere. It deplored the indifference manifested by a large majority of the companies, and urged a more general effort for protection against legislative schemes that threatened their interests.

The Committees on Ways and Means and Municipal Ownership not being ready to report, further time was granted.

On motion of Mr. Debell the report of the Committee on Entertainment and Programme was accepted as printed.

A discussion followed in relation to excursion projects, and several letters were read inviting the Association to hold its June meeting in Duluth or West Superior, Mr. Hill of Chicago making a strong

plea in favor of those cities, which are only a few miles apart.

Mr. Bean—I do not want to interfere with the papers in any way, shape or form, but there are a number of valuable papers to be read before this Association, and therefore I move that the matters which have just been considered be referred to a committee of six to be appointed by the chair, and that the subject be brought before the meeting at a later hour.

The motion was seconded and unanimously carried.

The Secretary moved that C. E. Van Bergen, F. S. Walker and J. M. Hill, of Chicago, be transferred to the active list of membership.

The motion was seconded and unanimously carried.

A paper was then read by Mr. Alexander Dow, of Michigan, on the subject of "Electric Lighting for Profit."

A brief discussion followed.

The subject of municipal ownership was then taken up and discussed.

The President then appointed as committee on location of summer meeting, to consider the invitations which had been presented and to make report to the Convention, Messrs. Bean, Norcross, Livermore, Debell, Higgins and Paige.

Several applications for membership were presented and the applicants duly elected members of the Association, after which the Convention adjourned until 10 o'clock A. M. Thursday.

THURSDAY—*Morning Session.*

The meeting was called to order at 10:40, President Copeland in the chair.

A number of applications for membership were presented and favorably acted upon.

The Secretary—I would like to have the Association consider the question whether an active member who is the owner of a plant, where the plant itself has not been admitted to membership, can appoint a proxy to represent him at the Convention.

The President—I understand if any individual is an active member it includes his plant really. They take the membership in their own names instead of the names of the plant, and I consider that it really means the plant, and I should say that it would be proper to admit them.

Lieut. Francis A. Badt, of Illinois, then made an address on the subject of "Topics of Interest to Central Station Men."

[Mr. Badt's paper was exceedingly interesting and deserves printing in full, but lack of space compels us to defer its publication and that of others read at the Convention to a future issue.]

The thanks of the Convention were unanimously tendered to Lieut. Badt for his address.

Mr. W. M. Edgar, of Illinois, then addressed the Convention on the subject of "Physical and Chemical Properties of Volatile Oils in Boilers," which was discussed at length.

A vote of thanks was extended to Mr. Edgar for his valuable address.

Mr. DeLand then read a paper written by Mr. John C. McMynn, of Illinois, on the subject of "Practice of Theory."

A letter from Mr. Henry C. Payne, regretting that, owing to the advice of his physician, he would be unable to attend the banquet, was read.

A paper was then presented on the subject of "Present Efficiency of Incandescent Lamps," by Mr. John E. Randall, of Missouri.

During the reading of the paper Mr. Randall said: "I do not believe it is generally known that the ordinary gas burner decreases very markedly in its efficiency after a very short time; an entirely new tip will give a much brighter light than one that has been used a comparatively short time. That is true of all our illuminating devices in gas. The Welsbach mantle is a remarkable instance; it has an intense brilliancy for a short time, which is very quickly lost."

A unanimous vote of thanks was extended to Mr. Randall for his able paper.

A recess was then taken until 2 P. M.

THURSDAY—*Afternoon Session.*

The Convention was called to order at 2:30 by the President.

A paper on the subject "Electricity in Municipal Engineering," by Prof. R. B. Owens, of Nebraska, was then read for him, and a unanimous vote of thanks was extended to Prof. Owens for his paper.

A paper on the subject of "Municipal Socialism" was read by Mr. Fred DeLand, of Illinois, and was followed by a discussion. Mr. DeLand was thanked by unanimous vote for his paper.

Mr. Bean—Prof. Jackson of the University of Wisconsin is here and he has valuable information on the subject of depreciation, and we want to hear from him. I desire, however, first to draw your attention as station managers to what Mr. Dow said yesterday. I made the motion to receive his valuable paper, and I would like to have had more time to discuss it among us for our own benefit. He said, if I am not mistaken, that it was about \$86 or \$89 that it cost the city of Detroit for each lamp, with only 4 per cent. allowed, as stated by Mr. Doherty, for depreciation on boilers. Well, if the city of Detroit is running an electric light plant with nothing to depreciate but boilers, I am going to Detroit to learn how to run a plant; and I want the central station men to bear in mind in talking to their neighbors and advocates of municipal ownership that the city of Detroit is not getting lights at the rates named on paper. The statements are very misleading. No provision is made by Detroit in the way of forming a surplus, and without a surplus how can they renew their plant? They cannot do it? I trust you will bear that in mind. The city of Detroit does not get lights at the figures claimed, as they make no allowance for depreciation except that mentioned.

Prof. Jackson then delivered an address on "Depreciation," and was loudly applauded as he finished. A discussion of the subject followed.

Mr. Thayer—I have in my hands a batch of seventeen reports, such as they are—I should not call more than two of them real reports—from municipal plants in the State of Iowa. Some six or eight weeks ago I was written to by the secretary of some syndicate of Eastern capitalists who were about to lose their city service in Tonawanda, N. Y., on the ground of the excellent showing of the Marshalltown plant, which is alleged to be running at lights for \$18 a year. (Laughter.) Now I have out of that list three or four reports that are sufficiently explicit so that we can draw some deductions from them.

[Mr. Thayer gave all the material facts contained in these reports and pointed out their inexplicable differences in the cost of operation and general results. He concluded his remarks as follows: "The conclusion I want to draw from this is, that the city officials of these smaller plants are business men and not electric light men, and while they are honest in their intentions they do not know what their business is costing them, and when they send out reports like these it injures every plant in the vicinity, because the cost of light is reported as being low, and citizens say the light costs about double of what it should, and something is wrong; prices ought to go down. It is our duty, I think, wherever there are any municipal plants anywhere near us to either visit them or get somebody who knows something about it to go there and get the actual operating expenses. I have done that in a few cases and there are a few plants that have promised me when their annual reports are out to give me full reports of the whole thing, and I think at the next meeting we can get a few of these reports and bring them in and have them printed in our regular proceedings, and they will be very useful afterwards as works of reference."]

A long discussion upon municipal lighting plants took place at this point, the consensus of opinion

being that the statements made by municipal officials are defective in essential points and thoroughly misleading.

A vote of thanks was extended to Mr. DeLand for an offer of books giving information in regard to municipal ownership and for the efforts that he has made on behalf of central stations.

The President—If you all feel as I do now, I think that you realize that you have got more for your money in the last hour than you ever got for that amount of money in your life before, and any member of this Convention that has not been in the hall during this talk does not know how much he has lost; and I would suggest for the benefit of the Entertainment Committee next year that when we go into session we remain in session until we get through.

On motion of Mr. Bean the Convention went into executive session.

The report of the committee on midsummer meeting was then presented, and recommended that no midsummer meeting be held in 1898. The report was accepted and committee discharged.

Mr. Doherty—I move that a committee of five be appointed and that this matter be referred to them with full power to act and that they be clothed with the full power of the Association, a decision to be reached by the 1st of April, 1898.

Motion seconded and carried.

Mr. Doherty—I move that a vote of thanks be tendered Mr. Hill for the remarkable work he has done in behalf of this Association.

Motion seconded and unanimously carried.

A motion was made that the President and Secretary of this Association be appointed to attend the next session of the National Association at Chicago, Ill., to represent this Association in that body.

Seconded and unanimously carried.

Mr. Bean—As chairman of the Committee on Municipal Ownership, I wish to say that the Government is getting out a report and the Hon. Carroll D. Wright, Commissioner of Labor, will put his sanction upon that report, and it depends upon every central station man whenever this blank is sent to him to fill it out. There is a different blank for municipalities. Remember that when the United States Government puts its stamp on this report that is the end of it.

The President—This blank should be filled out as absolutely and completely as possible. The reports of course are made in absolute confidence.

A number of additional members signed the register.

An adjournment was here taken to 10 A. M. Friday.

FRIDAY'S SESSION.

The Convention was called to order by the President at 10 A. M.

The President appointed as the committee referred to yesterday to consider the question of the midsummer meeting, Messrs. Norcross, Doherty, Dee, Korst and Hill.

Adjourned sine die.

Power House for the Naval Academy.

Assistant Secretary of the Navy Roosevelt in a letter to the Secretary of the Navy states that among the immediate and pressing needs at the Naval Academy at Annapolis is a power house. He says: "We need a first-class power house. The present buildings are makeshifts and ought to be replaced. This will cost \$100,000, and \$90,000 will be required for the grading, the electric light wiring, removing old buildings, etc., as rendered necessary in carrying out the work of building."

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

UNIPOLAR SELF-EXCITING ALTERNATOR.*

BY J. L. ROUTIN.

The problem of the self-excitation of an alternator is of but little moment so long as it is a question of important central stations, it being fully recognized in such cases that the simplest and most rational solution is to have the alternators separately excited by one or more independent machines.

This is no longer the case, however, as we shall show when it comes to installing apparatus in a private plant of moderate size. In such an event the material must be as simple and strong as possible, for the operation and maintenance of the apparatus is often confided to the care of persons with limited experience. In most plants of the above nature direct current alone is generated and this can be readily explained when it is remembered that alternators require to be excited either by means of a small direct-current machine or by the use of a special

FIG. 1.

commutator, and as there is no material gain in power or saving in price they have no very marked advantage over direct-current machines.

In spite of all the improvements that have been added to it, the direct-current generator, which at the present time is considered to have reached a high state of perfection, necessarily requires for its operation delicate attachments, the satisfactory operation of which depends on constant and careful supervision. Unquestionably in large central stations, where expert electricians are in charge, the proper maintenance of the commutators presents no serious difficulty, but on the other hand it is equally acknowledged that it is always due to the deterioration of this very part that dynamos that have little care given them ultimately fail. This is what often occurs with machines in private plants.

The above considerations led me to seek to discover a generator capable of operating without the help

FIGS. 2 AND 3.

either directly or indirectly of a rectifying commutator.

The solution which I sought applies to alternators of the type known as unipolar. Let A, Fig. 1, be the magnet and B the armature, the latter can be provided, as is well known, either with a single coil or two distinct coils, according to whether the pole pieces a_1 are situated opposite the spaces which separate the pieces a_2 , or opposite the pieces themselves. These two positions are shown in Figs. 2 and 3.

However this may be arranged, if we suppose a

* Translated from *L'Eclairage Electrique*, Paris, for *ELECTRICITY*.

conductor C placed in the massive section of the armature, as is shown in Fig. 1, it will readily be seen that there will be developed therein an electromotive force capable of generating a continuous current.

Calling θ the total flux through the core A, and n the number of revolutions per minute, the value of e in volts can be determined by the formula—

$$e = \frac{n}{t} \theta 10^{-8}$$

It is this electromotive force that I make use of for the self-excitation of the alternator. To accomplish this it suffices to connect the extremity 1 of C to one end of the coil D (assumed stationary) and to complete the circuit as shown in Fig. 1 by means of the contact rings 2 and 3 (electrically connected either through the mass or by means of a special conductor). It is true the difference of potential obtained is scarcely more than a few volts with machines of moderate power, but this is no serious detriment, for the weight of copper necessary to excite any machine, as can be readily shown, is absolutely independent of the voltage utilized.

In actual practice it may be found necessary to employ several conductors similar to C, connected in parallel. The exciting coil, moreover, carrying several circuits, could be so arranged as to aid a multiple contact interrupter; the tension could therefore easily be regulated by means of a rheostat placed on a single one of these circuits, and large variations could be controlled by moving the interrupter previously mentioned.

Through the courtesy of MM. Brown, Boveri & Cie. and the directors of the shops of Oerlikon, I have been able to make a few experiments to determine what results could be obtained with an alternator excited in the way I have just mentioned. I have ascertained that the increase of voltage with full load excitation is but a small percentage over that at no load excitation.

At the Oerlikon works this self-exciting method was applied to the ordinary type of generator manufactured by that firm. The copper ring 2 was done away with and the interior brush rubbed directly against the core A; notwithstanding this it was possible to obtain a current amply sufficient for self-excitation as is shown in the following table.

The first column gives the speed of the alternator in revolutions per minute, the second gives the number of ampere turns at normal excitation, and the third and fourth give the limit of voltage of C and the intensity of current on the unipolar circuit in which a rheostat was located.

THREE-PHASE GENERATOR WITH 2 x 4 POLES.
Normal speed 450 revolutions, 950 volts, 30 alternations.

Revolutions.	Ampere-turns.	Voltage.	Intensity of current for self-excitation.
415	480 x 7	1	0
415	480 x 12	1.8	0
415	480 x 18.5	2.5	0
415	480 x 25.5	3.1	0
415	480 x 18	1.9	204
403	480 x 26	2.6	420
405	480 x 24	2.4	420

Resistance of exciting coil, 2 ohms.
Maximum exciting current, 25 amperes.

Admitting as correct the value of density and speed at the points of contact of the brushes with the rings—the figures being determined with the Siemens generators with outside collector rings—we find that with the generator on which we experimented three brushes of 3 cm. by 1 cm. would be ample and that the speed could attain 575 revolutions.

It is only proper in closing to state that this arrangement could be advantageously applied in the construction of small synchronous motors as well as to transformers destined to be used for electro-chemical purposes.

THE MIDLAND RAILWAY'S ELECTRIC LIGHTING PLANT AT LEICESTER.*

When Mr. W. Langdon in 1895 read his valuable paper on "The Employment of the Electric Light for Railway Purposes," the plant at Leicester had not long been running, and hence the figures of cost of working could not be given. Now that the plant has been at work for some few years, a *resumé* of the results achieved will be of interest to our readers. During the intervening period many improvements have been made to the various engines, machines, and other apparatus used, and the plant generally has been subjected to more than the renewals usually allowed for in central-station work. Thus the figures for repairs and wages are higher for the time being than would be found if a obseese paring policy were adopted. Mr. Langdon believes in the best machinery and treating it in the best possible way, and hence the electric lighting stations of the Midland Railway Company are models of their kind.

The site available for the station was limited in extent, and this influenced the arrangements. In fact, due to the increase of the incandescent lighting, a portion of the space which has to be used for the men's quarters had at the last moment to be thrown into the engine-room. The lights supplied from the station include the following: 113 series arc lamps, taking 10 amperes each; 23 arc lamps, supplied in parallel circuits of two lamps in series; 11 32-c. p. incandescent lamps, 189 16 c. p. lamps and 120 8-c.p. Thus the series lighting corresponds to a load of 57 kw. and the parallel lighting to about 30 kw.

The series arc lighting is supplied from three Brush arc lighters of the old open-coil type. The regulation of the voltage of these machines, each of which is capable of taking 50 arc lamps, is effected in the usual way by carbon rheostats and relays. The most noticeable part of the arc lighting gear is the switchboard, which was designed by Mr. Langdon's staff and manufactured in the Midland Company's shop. With this board the use of flexible cords and plugs is avoided, and the face of the board at any time indicates in diagram the circuit arrangements. Thus the circuits are so arranged that whole platforms can be switched on or off from the engine-room. In this way the lamps are run on some seven different circuits, having from nine to thirty lamps each, which are grouped together at the board as may be required. The latter is composed of 12 panels. The panels are of slate, mounted in a wooden frame. There is in the center of each panel a horizontal metallic axis, on which swivel eight sockets, all connected together. Into these sockets loose switch bars with handles are placed, which make connection with either jaw in the two rows of eight jaws at the top and bottom of the panel. Seven of the panels have the central axis connected to circuit positives, three are connected to dynamo negatives, and the other two with voltmeter terminals. The contact jaws at the top of the panels are positives, and the lower jaws are circuit negatives. Thus in building up a number of circuits on to one machine, a switch bar is inserted in the swivel plug of, say, circuit positive No. 1, which is opposite to the jaw connected to, say, dynamo positive No. 2. Then if No. 3 arc circuit is wanted next in the series its positive is switched on to the negative of No. 1 at the third panel. Finally, after perhaps another circuit has been added, the negative panel of dynamo No. 2 is used to switch on to the negative of the last circuit. With this system of connection it is easy to cut out any arc circuit from a series by short-circuiting it, and it does not matter at which part of the series the circuit happens to be. Over these switch panels are placed circuit current indicators, to show automatically which way the current is flowing. Over these again comes the three ammeters placed in the dynamo circuits. The whole of the metal parts of this switchboard are encased with

ebonite, except at the contact surfaces, so that it is not dangerous to the operators.

The parallel lighting plant consists of a Brush two-pole direct-current dynamo giving 290 amperes at 115 volts when running at 800 revolutions per minute. This is driven from the same sized gas-engine as is used to drive the arc lighters. Besides this machine, there are two Siemens dynamos, each capable of giving 125 amperes at 115 volts when driven at 600 revolutions. Two smaller gas engines are used to drive these two machines. There is nothing special to note in the switchboard for this part of the station, but the compensator placed in the feeders needs special reference. This compensator was designed by Mr. W. B. Sayers, and manufactured by Messrs. Mavor & Coulson of Glasgow. It consists of a generator and motor mounted on the same shaft, but on separate cores, to allow of the fields being separately excited. The motor is shunt wound for running at constant speed on the 110-volt circuit, while the generator is series wound. The design of this latter machine is so arranged that the voltage is increased in direct proportion to the current flowing in the circuit. This little dynamo is wound for a maximum of 150 amperes, and then generates 10 volts. It runs at a speed of about 1,080 revolutions per minute. Previous to its use trouble was found with the arc lamps used in parallel off the low tension mains, as they were apt to hunt. Now the voltage at the further end of the line is kept constant independent of the load.

The engines were all supplied by Messrs. Crossley Bros., and are of their special high-speed electric lighting type. The engines driving the arc lighters and the larger low-tension dynamos are each capable of developing 50 H.P., using Dowson gas, and running at 200 revolutions per minute. The engines have cylinders 16 in. in diameter and a 21 in. stroke. As there are no batteries as a stand-by, it is essential that the engines shall be capable of running continuously. Hence an efficient arrangement of oiling has been devised, and added to the engines since their erection. The crank pin is oiled by means of a centrifugal oil shield attached to the crank. A sight-feed lubricator drops oil into this, which then flows up into the crank-pin bearing. In this way very prolonged runs in time of fog have been made. The system of oil catching has also received special attention. The first foundations of the engines suffered from the oil running down and rotting the concrete. This necessitated the renewal of the foundations, which are now covered with sheets of lead, in which channels are arranged to conduct the waste oil away into suitable receptacles.

Since the engines were first laid down, counter-weights on the cranks have been added by the Midland Railway Company, which have much improved the steadiness of the running of the engines. These counter-weights were fixed on in the company's shops and the method of strapping them on by rectangular iron bands is particularly neat. The ignition in these engines is by means of tubes, both iron and porcelain having been tried. We understand that the porcelain tubes are found to give satisfaction if due care is taken of them. The heating of these ignition tubes is done by town gas. The engines can be run by either Dowson or town gas, and the admission valves and pipes are so arranged that the change over from one to the other can be quickly made. This would seem at first sight to be a great essential, as the gasholder used for the power gas would not run the full load for many minutes if a breakdown in the generators occurred. Mr. Walter C. Goodchild, the resident engineer, informs us, however, that such breakdowns do not occur in practice. The town gas stand-by is hence rather an expensive luxury, as a minimum consumption of 1,500,000 cubic feet of gas per annum had to be guaranteed before the Corporation laid down the necessary mains. Before leaving this part of our subject, we cannot help referring to the painting of the engines. This has been done again, and each

engine is ornamented by the coat-of-arms of the Midland Railway Company.

At Leicester there are now installed two complete sets of Dowson generators and boilers, each capable of developing gas for 100 H.P. at the engine. Each set has its own gas-cooler, hydraulic box, coke-scrubber and sawdust-scrubber. The boilers are not both used at the same time, as one will supply sufficient steam for both generators. As regards the working of the apparatus, we may state briefly, for the benefit of our younger readers, that the generators consist of a closed cylinder with firebars a few inches from the bottom. The fire is of anthracite coal, and the jet of steam and air under the bars regulates the production of power gas. The partial combustion only and the decomposition of the steam results in the generation of a considerable proportion of carbon monoxide, from which power is obtained in the explosion. This is the rough idea, but in the detailed working of such a plant great care is needed to ascertain the best method of working to produce uniform and good gas.

It is to the determination of the best method of working these generators that Mr. Goodchild, the resident engineer, has devoted special attention. The results he has achieved can be best seen from the following figures: The total cost per unit for the half-year ending December, 1895, was 3.30d., and in this period 4.6 lb. of coal were consumed in the generator for every Board of Trade unit developed by the dynamos. For the first half year of 1896 the cost per unit was 3.09d., and the pounds of coal per unit 3.66. Finally, for the first half of 1897 the cost per unit was further reduced to 2.8d., and the coal per unit to 3.03 lb. From these figures it will be seen that the coal required has been reduced from 4.6 lb. to 3.03 lb., or by 34 per cent. This reduction has largely been effected by the use of a cheaper class of coal. Up to July, 1896, both the generators were worked with ordinary anthracite coal. At that date one of the generators was altered to use machine-washed anthracite peas, which cost 5s. to 9s. at the pit's mouth. After adjusting the working arrangements, it was found that 25 per cent. better gas could be obtained with the small coal. With the ordinary anthracite a fire about 4 ft. deep was used in the generator, whereas with the machine-washed peas 18 in. of fire gave best results.

The better results obtained are said to be due to a greater uniformity in the fire itself. With the large coal and the cup and cone method of charging, the larger pieces get to the outside and allow a certain proportion of steam and air to get through unaffected. With the small coal the grate area has been reduced to 2 ft. 6 in., while the lining of the generator is 3 ft. The second generator was converted to use the peas soon after the improvements in the quality of gas had been established. The advantages of the small coal may be summed up as follows: First, 25 per cent. better gas, enabling the 100 H.P. furnace to develop 120 H.P. to 130 H.P.; second, a more even quality of gas; third, the reduction in the cost of fuel; and lastly, the fact that the generator can be started up in much less time. It is usually found that in 10 minutes good gas is obtained.

The complete figures as to the cost of working at Leicester for the half year ending June 30, 1897, are as follows. The second column, headed 1896, gives the corresponding figures for the first half of that year:

	1896.	1897.
Arc lamps in use.....	137	141
Incandescents.....	288	320
Total units.....	126,514	137,070
Total cost.....	£1,631 9s. 1d.	£1,601 15s. 9d.
Total cost per unit.....	8.09d.	2.8d.
Labor per unit.....	1.42d.	1.49d.
Stores and carbons.....	1.19d.	.86d.
Repairs.....	.13d.	.16d.
Coal.....	.32d.	.18d.

For the same half-year in 1897 the cost per unit generated by town gas was 1.42d. For comparison with a steam plant the figures obtained from Derby for the same half-year are as follows: Total cost,

*From the *Electrical Engineer*, London.

2.7d. per unit; coal, .38d. At Derby, however, there are no arc lamps to be trimmed, which saves considerable in the labor item. At Sheffield the figures are 2.64d. per unit for total cost and .54d. for coal.

It is interesting to note that if the Leicester installation had been worked without any town gas being used, the average cost per unit would be reduced to 2.67d. This figure is easily ascertained from the quantity of town gas actually burned during the half-year, and the corresponding cost of anthracite peas to produce the same power.

In conclusion, we have to express our thanks to Mr. W. Langdon for his courtesy in placing these figures at our disposal, and for kindly allowing us to inspect the works. We also have to thank Mr. Goodchild for explaining the various steps which have been made in perfecting the plant.

TRAMWAY POWER FROM LIGHTING STATIONS—WHAT IS A FAIR PRICE TO CHARGE?*

The present seems an opportune time for bringing to a point the discussion which has for some time been carried on regarding the question of what is a fair price to charge for electricity for tramway purposes when the power is generated by a lighting company or by a local authority at their lighting station. The divergence of view between the electricity seller and the electricity user is wide. We shall here attempt to bring out the issue by giving a statement of views on each side. Of course, the subject can only be dealt with generally, because every district of the country—one might almost say every separate town—presents its own local conditions and peculiarities which have their effect on prices. The situation which has led to the discussion is briefly this. In some towns the local authorities who run electric lighting stations have refused to consent to tramway companies adopting electric traction unless the companies buy the current from the local authorities, and, of course, pay the price which the sellers demand. In other cases there may be circumstances which render it advisable for the tramway companies to buy power from the local authorities or lighting companies, instead of generating current themselves. The owners of the lighting stations say they cannot afford to sell the current at less than a certain rate; the tramway companies maintain that it can profitably be sold at a much cheaper rate, and that if the higher price is insisted upon they simply cannot afford to use electricity. This is the situation, and as there has been comparatively little practical experience as yet in this country of the cost of generating electricity for tramway purposes there is some room for uncertainty. In fact, so far as published accounts go, there is nothing to show what is the cost per Board of Trade unit of generating current for traction.

We shall first give a statement of the case from the point of view of the seller—that is, the local authority or the electric lighting company. The accounts of these bodies show a wide divergence in the cost (per unit sold) of producing current, varying with the locality and the amount produced. Of four local authorities selling more than a million units per annum, the average cost is 1.63 pence; of four selling between half a million and a million units, the cost is 1.95 pence. At the other end of the scale, of twenty selling less than 200,000 units each, the average cost is 3.51 pence. Among companies one sells more than a million units annually, and the cost of production is 2.44 pence. Three sell between half a million and a million units annually, and the average cost is 2.28 pence. Omitting as before the medium quantities, we may jump to twelve companies selling less than 200,000 units each, and here the average cost is 4.26 pence. All these cases ex-

clude the Metropolitan area where the price of labor and in fact of most things is very high.

Taking up now the statement made to us the other day by the manager of a large electric lighting company, he points out that even in several towns on the Continent where more than a million and a half units are sold annually, the price charged is about 1½d. per unit. He thinks it could not possibly be less, and lays stress on the contention that with a tramway plant the load factor in proportion to the total capacity is as a rule not more than 50 per cent. When a plant is running at half load (on the average) the steam consumption is much greater in proportion than if the plant were fully loaded. With a lighting plant the average load factor is much higher and therefore the economy is greater. Then for tramway work it is wise to have a large reserve of power standing idle so as to provide for extra traffic and breakdowns. If half of the plant is in reserve as a rule, then the load factor on the whole machinery in working order may be only 25 per cent. Yet enough revenue has to be got to pay the interest on the whole plant, without saying anything of profits. On the other hand in a lighting station, taking load to plant capacity running, it is not impossible, nor even uncommon, to get 80 per cent. utilized. Besides these things, and partly dependent upon them, is the fact that the load on a lighting station is not subject to such rapid and frequent enormous changes as that on a tramway power station. In the latter case the load often jumps from almost zero to a few hundred amperes in a moment, or vice versa. This is very trying on the plant, and it is a trial to which lighting stations are little subject.

In the case of a lighting company or local authority providing current to a tramway company, the items actually chargeable to the traction plant would be coal, oil, and say, three additional men's wages. The lighting station superintendent would also superintend the traction plant. As to capital, special traction dynamos and engines and additional boilers would be necessary. Upon these interest and depreciation would have to be allowed. To meet all these things the charge for current sold to the tramway company, if the quantity sold was less than 100,000 units per annum, would have to be at least fourpence per unit. If larger quantities were sold, the cost per unit would be less. In the Midlands, with coal at the door, a million units per annum for traction purposes might be sold at 1½d. per unit, but in other parts of the country it could not be done for less than 2d. As to the possibility of dynamos and a system of circuits being devised which would serve for both lighting and traction, our informant thinks it probable something of the kind will be done in the future, so as to keep down capital expenditure and give a better load factor all over the plant. Perhaps some development of the three-wire system now coming into use for electric lighting may solve this point. At present, with a 220-volt pressure, double that difference of potential can be got on the three-wire system between the two "outside" wires when the two dynamos are coupled up in series. A potential of 440 volts approximates to some extent to the 500 used for tramway purposes. Thus far the statement from the sellers' point of view.

Next we give some arguments from the buyers' standpoint, as communicated by the management of a prominent traction company. The main feature is that the cost of electricity is not determined by the quantity produced but by the period of time per day during which it is used. While it is true that when machinery is running it is very much cheaper per unit to produce a larger than a smaller quantity, it must be borne in mind that if the machinery is not utilized to the fullest extent every unit obtained costs more than if the machinery is constantly and fully employed. For example, if the plant is fairly well loaded, for say, sixteen hours a day, as when used for tramway purposes, it is much more economically employed than if only loaded three or four

hours a day, as for lighting purposes alone. Apart from the question of men's wages and paying men to stand by in winter to have everything ready for a fog, it can be seen that the few hours' lighting per day have to bear the interest on the capital and all the management expenses. This, our informants insist, is a most important point, and its value will readily be recognized.

To take one case in illustration. In Brighton the ordinary consumer of current for lighting purposes is charged 7d. per unit for the first hour's lighting, but if he uses his lamps for more than one hour per day the charge for the subsequent hours is only 1½d. per unit. Thus for two hours' supply the charge is 4½d. per unit. If the consumer uses the electric current for sixteen hours a day (as a tramway company would), he pays 7d. per unit for the first hour, and fifteen times 1½d. for the rest of the time, or 22½d. for the whole period. (Readers need hardly be reminded that the unit includes a time element, seeing that it is 1,000 watt-hours). The charge then for the whole sixteen hours is only 1.8 pence per unit. The Brighton Town Council herein recognize the importance of having a load distributed over a long period of the day (or night), and give this great encouragement to the consumer, no matter on how small a scale may be his demands. The lesson drawn is that even more favorable treatment can safely be conceded when dealing with a tramway company who want current for at least sixteen hours per day, and who will require perhaps half or two-thirds of the total load on the electricity supply station. Having such a large customer, the local authority or lighting company can well afford to put down special plant, and can have cheaper arrangements (proportionally) for the staff running the station. Consequently, special terms should be granted to such a large customer—a customer before whom all others individually pale into insignificance. The Brighton system of charging for light requires a special instrument to record the duration of use, and this was devised by Mr. Arthur Wright, engineer to the Corporation. The wisdom of the system is shown by the fact that it has been adopted in many towns all over the country.

In Mr. E. Garcke's "Manual of Electrical Undertakings" for 1897 we notice that some reference is made to this subject, and the point is emphasized that the cost of supplying electricity depends more upon the rate of supply than upon the quantity supplied. The great bulk of the expense is governed by the maximum demand.

To return to our informants, they insist that another very important point is that in a lighting station the charges made to the public and the costs of production given are calculated on every unit actually supplied to the lamps. The total amount so supplied is considerably less than that produced in the stations, because there is a great loss in distribution and because there is as a rule a quite appreciable proportion of the total output consumed in lighting the station itself and the premises connected with it. This fact is very apt to be overlooked. The result is that both the charge to the consumer and the cost of production returned are materially higher per unit than they would be if every unit generated were sold. The local authority or lighting company cannot charge the consumers for every unit generated; the charge is for every unit consumed by the customer as registered by the meter on his own premises. But if a tramway company takes current from a lighting station the case is quite different. The tramway company buys the current at the producing station, as measured by the station instruments at the point of exit, and therefore pays a great deal more than if it were to pay at the same price per unit for the current actually taken by the cars.

In this connection we have looked up the accounts of a large number of lighting stations, and find that the percentage of current actually sold to current generated varies from 61 to 98. The latter figure is

* From the *Railway World*, London.

quite exceptional, and the average may roughly be taken at from 75 to 80 per cent. Apart, therefore, from any other consideration whatsoever, the tramway company should have a reduction on the ordinary charges of at least 20 per cent.

Regarding possible improvements or modifications of electric lighting dynamos and circuits, our informants say that it will always be necessary to have separate generators for tramway purposes in order that the records insisted upon by the Board of Trade as to insulation, drop in potential, etc., may be kept.

Having concluded the statement of the two views of the case, one other point—it is not a very large one but it is cumulative—should be mentioned. The owners of lighting stations have to supply, lay and maintain their own mains, and this cost is part of the "cost of production per unit sold." But a tramway company would provide and maintain their own conductors and feeders from the switchboard all over their lines.

Doubtless the above considerations are not exhaustive on either side. So far as they go, however, the bulk of proof seems to rest with the tramway companies. There can be no doubt about the fact that we have not yet seen the end of possible economies in the production of electricity when on a large scale, and when spread over the greater part of the twenty-four hours. A recent example from America will illustrate the point. On the tramway system of Brooklyn, amounting to 254 miles of track, the cost of power during the year ended June 30 last was only a shade over one halfpenny per car mile. Per unit it was a little over one farthing, and in the Kent Avenue station of the company (where 15,000 horse-power is installed) the cost per unit was just a shade above a farthing. The items included in the cost are fuel and supplies, labor and repairs. The corresponding items "per unit sold" at lighting stations in this country vary from one penny upwards, and the average may be put at about twopence. In this country it may be taken that on the whole the amount of current required per car mile is from .7 to .8 of a unit, against one unit or more in America. The difference is largely due to the fact that in the United States the demand for high average speed leads to very sudden startings after the stoppages, which consume an inordinate amount of current. On the question of quantity of current required, therefore, existing lighting stations need not be troubled. Take a town of moderate size with ten miles of double track or its equivalent in double and single. A mileage of 300 car miles per mile of double track per day is not extravagant. This is 3,000 car miles per day, or, in round figures, over a million car miles per annum. At .75 of a unit per car mile we get three quarters of a million units per annum. The calculation need not be applied to the large cities, because there the tramway companies or local authorities will no doubt produce the current independently of any lighting stations. On the whole there seems to be good ground for contending that in the neighborhood of coalfields at all events the charge for power by lighting stations should not exceed three halfpence per unit, and should in many cases be considerably below that figure.

Electrical Activity in Texas.

A meeting of the executive committees of the Texas Gas & Electric Light Association and the Texas Street Railway Association was held at Austin, Texas, on January 16. Mr. L. T. Fuller presided. After some discussion it was decided to hold a joint meeting of both Associations at Laredo, Texas, on March 9, 10, 11 and 12, 1898; to extend an invitation to the gas and electric street railway and power men of Mexico, and to devote a part of the programme to papers prepared by the latter.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

LONDON NOTES.

[From our London Correspondent.]

Telegraph Rates from Europe to Jamaica.

By an arrangement arrived at by the West India & Panama and associated English telegraph companies a large reduction in telegraph rates between Europe and Jamaica came into force on January 1. The rate hitherto has been 5s. 10d., but it is now 3s. per word—a reduction of 2s. 10d. This reduction is to be extended to the West India & Panama Company's stations east of Jamaica, and will also include Demerara.

Principles of the Electric Telegraph.

Prof. Oliver Lodge has just been delivering a course of six lectures adapted to a juvenile auditory at the Royal Institution of Great Britain. He divided his subject off into the following sections: (1) The production of an electric current; (2) detection of an electric current; (3) land telegraphy; (4) ocean telegraphy; (5) principles of wire and cable signaling; (6) space telegraphy. The lectures being specially prepared for young people were of course very elementary and the many experiments shown were on the same lines. As usual with the Christmas lectures at the Royal Institution, large audiences have been in attendance. The chief interest undoubtedly centered around the concluding lecture on Saturday, January 8, when "Wireless Telegraphy" was the subject. Dr. Lodge has done a good deal in this direction. An outline of his lecture gives these points: Ancient methods of signaling through space, followed by comments dealing with electric methods. Electric wireless telegraphy depends on the emission into space of a wave or pulse equally electric and magnetic. A wire could guide this impulse to a destination, but without a wire it spreads like sound. The lecturer next dealt with telegraphy by magnetic impulse alone, detected by induced currents, and best directed by iron; telegraphy by electric impulse alone, detected by electroscopes, and best detected by copper; telegraphy by electro-magnetic impulse, a true and simple wave of the electric and magnetic energies are equal, with a definite velocity; production of electro-magnetic waves: Henry, Helmholtz, Lord Kelvin, Feddersen showed that a Leyden discharge was oscillatory, Clerk Maxwell, FitzGerald and Hertz showed that such oscillations emitted waves; detection of electro-magnetic waves at a distance: by Hertz, Branly and by many other experimenters; recent attempted application of the waves and their detectors to actual business telegraphy; meaning of electric resonance, or *syntony*, and absence of it from the practical attempts so far made and published; mode by which it may be attained; syntonic telegraphy; electro-magnetic waves and detectors for them are also in reality very ancient; the sun or a candle is an emitter, the eye or a photograph plate is a detector; in other words, ordinary light consists of a succession of true waves, with equal electric and magnetic energies, traveling in the ether at the speed of a pure and simple telegraphic signal.

Underground Electric Railways for London.

The construction of the underground works in connection with the several railway lines beneath the city of London is making good progress, and it is expected that before many weeks have passed one of the lines—the Waterloo & City line—will be on the verge of completion. The tunneling operations for the Central London line and the extension of the City & South London line are making headway, but no idea can be given as to when these lines will be ready for running. There are so many schemes and proposals on foot of this character that one is likely to be bewildered. In a few years underground London will be quite a network of electric railways. Two new schemes of which official notice has lately been given are the New Cross & Waterloo line and the Charing Cross & Paddington Electric Railway.

The Charing Cross line will commence at Northumberland avenue and terminate near the present Paddington station of the Great Western Railway. The new line will be connected with the Paddington station of the Great Western Railway by means of a subway. The capital of this scheme is somewhere about seven or eight million dollars divided into \$50 shares, and there will be from two to three millions in debenture stock. The line is to be completed within five years, during which time interest is to be paid out of the capital. The New Cross proposal, for which a private bill has been deposited, provides for the construction of an underground line from Old Kent Road, close to the London, Brighton & South Coast Railway, to Waterloo Road near the South Eastern Railway. The total length of the line will be a furlong or so over three miles and the work is to be completed within five years. The capital of the undertaking would be about four or five million dollars, with about one and a half million dollars in debenture stock.

London's Maximum Current Demand.

It appears that great difficulty is experienced by electric lighting companies and local authorities who supply electricity in London in providing sufficient energy to enable them to meet the demands of consumers at certain times of the day, while the production by each separate company and local authority of sufficient energy to meet the maximum demands involves the expenditure of large sums of practically unproductive capital, and results in the consequent increase in price that has to be paid for the current. It is proposed to overcome these difficulties by a company which seeks power from Parliament to erect generating stations on one central spot in Marylebone, on the banks of the Regent's canal, and from this point to supply electrical energy in bulk to any company, body or person at arranged terms.

YOU CAN'T STOP 'EM.

The Fury of an Unfettered Element Fails to Crush Them—The Fire Fiend Defied.

The news comes from Attica, Ind., of the destruction by fire of the big laboratory and office building of the Sterling Remedy Company, makers of Cascarets Candy Cathartic and No-To-Bac, the original guaranteed tobacco habit cure. The preparations made by this big corporation are known throughout the world, and disaster came like a bolt out of a clear sky.

The fire broke out in one of the packing rooms on the third floor during the noon hour, and had made considerable headway before it was discovered. The primary cause was a defective flue through which the fire was communicated to a big pile of packers made to contain the "Pyramid of Health" standers so familiar to all on the retail druggists' counter.

As soon as it became apparent that the fire department would have difficulty in combating the flames, the work of saving the thousands of valuable documents, contracts, files, millions of booklets and tons of advertising matter was begun with the utmost energy. The Sterling Remedy Company is the principal industry of the beautiful little city of Attica, employing several hundred people, besides being affiliated with the interests of the Indiana Mineral Springs, the famous Magno-Mud Cure. The entire population was worked up to a frenzy of excitement and hundreds of men, women and children vied with each other in carrying the contents of the burning building to places of safety.

The entire neighborhood was covered with scattered heaps of printed matter, letters, furniture, Cascarets and No To-Bac, in interminable confusion, while the firemen struggled with the fire.

Meanwhile the almost proverbial energy and presence-of-mind of "Hustling" Harry Kramer, the general manager of the Sterling Remedy Company, was displayed. He was the coolest man at the scene, and while the destruction was going on was forming

lating a plan for continuing the business without interruption. He quietly walked away, and secured a big carriage show room near by, and had all office furniture, charred and dilapidated as it was, taken there. Before the boxes had ceased burning in which the fire originated, orders were being dictated in the make-shift office for new supplies, and car loads of material were ordered by wire while the streams were playing on the ruins. Several shipments were made the same evening from goods saved, and on Friday morning all departments were at work in various rooms about town, while a gang of men were clearing away the wreckage preliminary to rebuilding.

The actual damage amounts to many thousands of dollars; the loss due to interruption of business and confusion of detail is inestimable, but pluck and energy of one man will turn defeat into victory and move the wheels of business to ever-increasing speed. Nothing can stop the success of Cascarets and No-To-Bac with such characteristic force behind them.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

GENERAL NEWS.

What Is Going On in the Electrical World.

Akron, O.—George W. Crouse, one of the receivers appointed for the Akron Street Railway & Illuminating Company, has stated that the company would soon be reorganized, and that the bond issue, the interest on which was defaulted, would be decreased.

Amsterdam, N. Y.—A. Jay Devendorf and Henry A. Devendorf have entered into an agreement with the Amsterdam Street Railroad Company, the Amsterdam Arc Light Company and the Edison Electric Light & Power Company to furnish hydraulic power for fifteen years, beginning soon after April 1. The plant will be located on Schoharie Creek near Mill Point.

Atlanta, Ga.—A company of New York and Pennsylvania capitalists has acquired control of the Chattahoochee river from Jones' Shoals to Power's Ferry, and have taken options on land valued at \$175,000, including three shoals capable of developing 11,000 horsepower. The projectors have secured all the options they need and under legislation enacted at the recent session of the General Assembly are given power to condemn property needed for the development of the water power in the same way that property is condemned for railroad purposes. Col. H. H. Berry, of Gainesville, a prominent lawyer, representing the capitalists, has filed in Fulton Superior Court an application for a charter for the Atlanta Water Power Company, and their agent, Colonel Cook, an English engineer, is expected to arrive here soon to begin active work on the development of the water power.

Chicago.—President Louderback of the Lake Street Elevated Railroad Company is quoted as authority for the announcement that the suburban trains of the Chicago, Milwaukee & St. Paul Railroad will soon be operated by electricity instead of steam, and that already contracts for furnishing electric power for the trains had been entered into with the North Chicago and West Chicago Street Railroad Companies.

Charleston, S. C.—A bill has been presented in the Legislature at Columbia to incorporate the Charleston & Seashore Railroad Company, whose object is to build and maintain an electric road in Christ Church Parish, Sullivan's Island and Long Island, to the ocean. The incorporators are J. S. Lawrence, Philip H. Gadsden, W. W. Lawton and their associates. The bill empowers the company to manufacture, produce, generate and supply light, power or heat, not only for the purposes of the said railway, but for sale to the general public. The capital stock is placed at \$500,000.

Cincinnati, O.—The Bullock Electric Manufacturing Company is said to have fixed upon a site at Norwood, a suburb of Cincinnati, for its new works, and at a cost of \$100,000 will build there, the "Enquirer" says, "one of the most attractive and modernly arranged manufacturing establishments in Cincinnati." When the new works are completed 300 men will be employed.

Cleveland, O.—The largest armature for the largest generator of electricity ever made in the world for a trolley railroad has been completed in Cleveland, and shipped from the works of the Walker Company for Brooklyn, N. Y. The whole generator when assembled will be twenty feet high, twenty feet long and fifteen wide. It is the first of a pair of such monsters being made by the Walker Company for the Brooklyn Heights Street Railway Company. The armature weighs 99,000 pounds. It is 7½ feet wide and 10 feet high.

Denver, Col.—Neil McDonald of New York, a prominent railroad promoter and builder, was a recent visitor in Denver, the object of his visit being, it is understood, to consult with interested parties in regard

to a proposition to build an electric line from Denver to Boulder.

Dolgeville, N. Y.—The formal opening of the generating plant of the Dolgeville Electric Light & Power Company was celebrated in this village on the 15th inst. The village was dressed in holiday attire in honor of the occasion, nearly all of the business places and many of the private residences being decked with flags and bunting. A large number of distinguished visitors from all parts of the State had been invited and most of these were present, among them Lieut. Governor Woodruff, who was selected to start the machinery. In the evening a banquet was provided in the Turn Hall, which was splendidly illuminated with electric lights. Several good speeches were made and Alfred Dolge, the enterprising head of the company, delivered an address in which he dwelt upon the rapid growth of the village and pointed out its availabilities as a manufacturing center.

Fort Wayne, Ind.—The Ft. Wayne Electric Corporation has recently equipped its polishing room with an apparatus for purifying the atmosphere of the room by carrying all sand or small particles of metal loosened by the polishing machines into tanks on the outside of the building. The apparatus consists of a series of pipes leading from the machines to a large drum in which an exhaust fan revolves at the rate of about 1,600 revolutions a minute. The draught caused is strong enough to remove the dust of the machines and will prevent much sickness caused by the men having to inhale this dust.

Guthrie, Ok.—The Guthrie electric light plant has been sold to J. W. Bedle of Lacey, Minn., and J. O. Severns of this city. The plant is valued at \$30,000.

Houston, Tex.—Blake Dupree, receiver of the Citizens' Electric Light Company of Houston, has filed his bond with the clerk of the United States Court in the sum of \$10,000 and taken possession of the property.

Joliet, Ill.—By unanimous vote of the city council the Joliet City Railway Company has been given a franchise for fifty years and several miles more of streets. The company has \$500,000 invested, and will put \$200,000 more in this winter. This is the first franchise granted under the Allen law, which was passed at the last regular session of the Legislature. The public in general are in favor of the franchise granted.

Milwaukee, Wis.—The "Sentinel" says: "The General Electric Company is reported to have an alliance with the E. P. Allis Company of this city to furnish electric equipments for large plants in all parts of the world. The Allis Company furnishes the engines, while the electric company furnishes generators. Equipment is now being furnished for the cities of Dublin, Madrid and other European towns."

New Orleans.—The directors of the Orleans & Jefferson Railroad Company have abandoned their original intention of using compressed air as motive power for the road and decided to adopt electricity. They have closed a contract with J. W. Coffin of New York for the entire construction of the road and its equipment with the trolley system.

New York.—The purchase of a controlling interest in the Union Railway Company ("Huckleberry Road") by the Third Avenue Railroad Company greatly widens the field of its operations. The Union Company has at present single and double tracks laid in thirty-seven miles of streets, and has franchises for fifty-four miles of streets in the district north of the Harlem River. The company's statement for the year ending June 30 last showed that it earned \$86,391 over and above all fixed charges and taxes.

New Haven, Conn.—A dispatch from Torrington to the "Leader" states that Capt. J. M. Murphy, inventor of the "Safety Third Rail Electric System," has made arrangements with a manufacturing firm at Torrington for the construction of a complete model of his system which is to be sent to London for examination by some railroad magnates. The dispatch adds that "a construction company has been organized, with two millions capital and Henry Villard, formerly of the Northern Pacific, as president. The switches are so far made in New York, but Capt. Murphy has not yet given up his hopes of the concern deciding upon Torrington if proper inducement is made."

Owego, N. Y.—The Decker-Hinckley Electrical Manufacturing Company's manufactory is fast nearing completion in this village and promises to be one of the most completely equipped establishments in this section of the State. The company will make a specialty of an automatic switchboard which Mr. Decker has patented in this country and abroad. The members of the company are Ward Decker and Edward J. Hinckley.

Peoria, Ill.—The stockholders of the Peoria & Pekin Traction Company have voted to increase the capital stock of the company from \$300,000 to \$500,000. They also voted to issue bonds to the amount of the stock, the bonds to be for \$1,000 each.

Reading, Pa.—There is now a strong probability that the electric railway between this city and Boyertown will be built. The right of way has all been secured, and it is stated on good authority that New York and Philadelphia parties are ready to buy the franchise and construct the road.

Schenectady, N. Y.—The General Electric Company is preparing plans for a large iron foundry to be located in this city. The officials of the company also announce that they are considering the advisability of removing the lamp works now located at Harrison, N. J., to Schenectady.

Schoolcraft, Mich.—The question of bonding the village for electric lights and water works was to be voted on January 25.

Sheffield, Tenn.—The Mussel Shoals Power Company, organized here a few days ago, proposes to establish a \$500,000 electrical plant at Mussel Shoals in the Tennessee River and furnish power, light and heat to a number of towns within a radius extending twenty or thirty miles from the station. Ample capital for prosecuting the work is said to be available and there seems to be no doubt here that it will be carried to a successful end. The officers of the concern are: T. L. Carter, president; C. B. Ashe, vice-president; J. R. Coleman, secretary and treasurer.

Shippensburg, Pa.—The Shippensburg Electric Light Company has reorganized and elected the following officers: J. L. Barner, president; W. J. Coffey, treasurer, and James Fleming, secretary.

Sterling, Col.—The town board has appointed a committee consisting of three of its members—C. M. C. Woolman, J. C. Akin and A. G. Sherman—and three citizens to make investigations as to the cost of water-works and an electric light plant.

Stonington, Conn.—A plan is being considered here for furnishing electric lights for the borough and for Noank, Mystic and Old Mystic from one plant. The officers of the board of trade are taking an interest in the question and making investigations as to the feasibility of the project.

Tonawanda, N. Y.—The Tonawanda Street Railway has been sold at sheriff's sale to the Michigan Pipe Company for \$50,000. The new owners will operate the road.

Toledo, O.—A number of East Side business men are seriously considering the question of erecting another electric light plant in this city. The plan proposed is to form a company with \$100,000 stock, one-tenth of the sum to be paid in at once and assessments to follow. The "Blade" says: "The East Side is at present paying exorbitant prices for electric lighting, and the citizens are going to solve the problem by having a plant of their own. The franchise will be asked for as soon as all plans are complete, and the stockholders will petition for the right of way through the alleys of the East Side. Residences and business houses will be lighted from the plant at a much more reasonable rate, it is claimed, than is now charged."

Victor, Col.—Work is to be pushed on the electric railroad between Canon City and Victor with the hope of getting it into operation early in July. The power for the road is to be furnished by an immense water plant at Canon City, from which electric power is to be generated sufficient to operate the line as well as supplying power and electric lighting facilities for the different mines adjacent to the company's right-of-way.

PERSONAL AND MISCELLANEA.

Frank Gilchrist, chief electrician at the Etna Standard Iron & Steel Works at Mingo Junction, O., was instantly killed on the evening of the 16th inst. by the explosion of a separator connected with the electrical department. He was thirty-five years old and leaves a wife and two children.

The only son of King Humbert of Italy is passionately fond of electrical research, and is said to be well acquainted with almost every species of electrical application, whether it relate to light, motive power, sound or photography. He has been one of the most successful experimenters with the X-rays. The prince has great admiration for Edison, and if he carries out his intention of coming to America in the spring, will probably make the acquaintance of the "Wizard," if young Tom's ascendancy does not create a doubt in his mind as to which is best entitled to royal cognition.

W. C. Hubbell, president of the Hubbell Electric Light Company of Scranton, Pa., has gone to Europe to negotiate the sale of the foreign patents for the electric bicycle and miner's lamp of which Mr. Hubbell and his son, H. C. Hubbell, are the inventors. Mr. Hubbell was accompanied by E. P. Mucklow of the firm of Boyle & Mucklow, who is interested in the patents.

"One of the softest snaps in all Michigan," says the Saginaw "Herald," "is possessed by the motorman of street car No. 70, which makes a 300-yard run from Washington avenue to the approach of the Bristol street bridge several times a day. He was never known to have a passenger, his report to the headquarters of the line never shows receipts and he runs his lonely car over the ridiculously short space allotted to him at regular intervals—every time it occurs to him and he feels so inclined. There is no danger of a collision on this line, for no other car ever trespasses on the rails set aside for the use of the dummy car. There is no danger, in fact, from any cause, unless it be, perhaps, from ennuui to the lonely occupant, or running too far onto the bridge and taking a cold bath suddenly. The cause of the running of this burlesque car is that the Consolidated Street Railway Company might not lose their franchise, for by abandoning a single division of the system they forfeit the franchise to the entire city."

The Denver "Republican" states that J. C. Henry, of Denver, formerly employed as an expert by the General Electric Company of New York, has just secured a patent for an electric controlling device for trolley cars. By Mr. Henry's method, which does away with brakes, the motor, when a stop is to be made, is changed into a generator by simply turning a handle in control of the motorman. This forces the current back into the wire and by eliminating the friction of ordinary brakes, makes, according to the estimate of the inventor, a

saving of 40 per cent. of the power needed to operate the line. The power that is generated by the change of the motors into dynamos passes into the wire and is used to operate other cars.

The United States Time & Weather Service Company has applied for a franchise in Philadelphia permitting it to erect "meteorological columns" in the streets and connect them with electrical conductors. The columns as described to the council committee are square pillars about 16 feet high. On the top of the column is a time-ball device which by means of electrical connections with Washington would be dropped at noon exactly. Beneath this time ball the column has clock faces showing the hours of the day, and under the clock are panels of glass on which advertisements are to be painted. It appears to be an advertising scheme requiring considerable capital as a starter.

Miss Mary Bardzick, a young woman in the employ of a lamp manufacturing company at New Brunswick, N. J., recently met with a distressing accident, which may result in the loss of both of her eyes. She is a tester of electric light bulbs, and while engaged in this work a lighted bulb above her head exploded with a sharp report, and pieces of the flying glass lacerated her face and entered her eyes. Her shrieks brought several of the workers to her aid and physicians were at once sent for, who did all they could to relieve her, but after an examination stated that her sight could never be restored. The firm, however, has put the girl under the care of New York specialists, and everything possible is being done for her.

"Telescriptor" is the name given to a new invention of R. S. Sample of Huntington, W. Va. It is an electric writing machine and has all the appearances of an ordinary typewriter. The Huntington "Herald" says of it: "The electric writing machine can be connected without special wires to telephone or telegraph lines, only requiring a like machine at the other end. By using the telephone attachment of the machine you call up central for them to connect you to any desired point where there is a like machine as you wish to communicate with him. No. 1 inserts paper also and begins to write the message. The message is written in a familiar, clear, typewriter hand. No. 2 receives his letter and No. 1 retains the copy. In this way the message can be sent over the wires without being read and should make it very convenient for newspaper correspondents and others who have numbers of messages to communicate."

RECENT COMPANY ELECTIONS.

Anacostia & Potomac River Railroad Company, Washington, D. C.—Directors: Daniel A. Christie, Henry C. McCauley, Henry A. Griswold, George H. Harries, Benjamin S. Minor, Thomas E. Smithson and Joseph Z. Williams.

Beacon Electric Company, Lansingburgh, N. Y.—President, J. George Kaelber; vice-president, Samuel Bolton, Jr.; treasurer, William M. Lea; secretary, Gilbert P. Williams; directors: J. George Kaelber, Samuel Bolton, Jr., William M. Lea, G. P. Williams, George W. Daw and Albert Will.

Brush Electric Light & Power Company, Savannah, Ga.—President, S. P. Hamilton; vice-president, D. R. Thomas; secretary, A. Minis; directors: Jacob Bauers, D. Y. Dancy, L. Kayton, G. W. Allen, J. R. Sheldon and John C. Rowland.

Capital Traction Company, Washington, D. C.—Directors: George T. Dunlop, Charles C. Glover, Henry Hurt, John G. Parke, John R. McLean, Edward J. Stellwagen and Wm. Manice.

Chicago City Railway Company, Chicago.—President, M. K. Bowen; vice-president, Joseph Leiter; directors: George T. Smith, Joseph Leiter, W. B. Walker, G. H. Wheeler, S. W. Allerton, D. G. Hamilton and M. K. Bowen.

Chester Electric Light Company, Chester, Pa.—President, H. B. Black; directors: John McGolrick, Joseph Messick, Joseph Deering, George E. Hetzel, I. Engle Cochran, William Provost, Jr., Robert Rigby, John R. Sweeney, Charles Palmer and Rev. George C. Moore.

Chambersburg & Gettysburg Railroad Company, Chambersburg, Pa.—President, W. S. Pilling; vice-president, W. H. Mole; secretary, H. O. Wood; treasurer, Joseph P. Ranney; general manager, T. I. Crane; directors: C. D. Wood, H. O. Wood, William Barclay Parsons, William H. Mole, New York; W. S. Pilling, T. I. Crane, Philadelphia; J. Burns White, Fayetteville; Joseph P. Ranney, Chambersburg.

Citizens' Electric Light Company, Downingtown, Pa.—Directors: John T. Fox, Joseph R. Downing, Guyon Miller, Dr. Edward Kerr, Joseph H. Johnson, Dr. Thomas A. Parke.

Cleveland City Railway Company, Cleveland, O.—President, M. A. Hanna, vice-president, C. F. Emery; secretary and treasurer, J. B. Hanna; superintendent, George G. Mulhern; directors: M. A. Hanna, C. F. Emery, C. A. Otis, D. P. Eells, J. H. Wade, J. B. Hanna, S. T. Everett, G. G. Mulhern and R. R. Rhodes.

Consolidated Electric Company, Portland, Me.—President, Weston F. Milliken; vice-president, Frederick A. Gilbert; treasurer, William R. Wood; clerk and manager, George E. Raymond; directors: Weston F. Milliken, William R. Wood, Charles R. Milliken, Leander W. Fobes, George P. Wexcott, Clarence Hale, Frederick A. Gilbert, James English, Stephen R. Small.

Columbia Electric Light & Power Company, Columbia, Pa.—President, Dr. Alexander Craig; secretary, Dr. S. A. Bockius; treasurer, E. B. Eckman; superintendent, A. Z. Staman; directors: Dr. A. Craig, E. B. Eckman, J. H. Herr, J. A. Minch, Dr. A. Bockius, A. Z. Staman, Dr. T. M. Livingston, H. H. Cramer, S. W. Guiles, C. R. Stickler, A. J. Kauffman and Dr. A. W. Rogers.

Cumberland Valley Electric Passenger Railway Company, Carlisle, Pa.—President, J. S. Baughman, New Cumberland; secretary, W. K. Myers, Harrisburg; treasurer, J. R. Miller; directors: O. A. Lee, J. D. Landes, J. S. Baughman, W. K. Myers and J. R. Miller.

Columbus Edison Electric Light Company, Columbus, O.—President, Adolf Theobald; vice-president, Joseph F. Martin; treasurer, Emil Klesewetter; secretary and manager, A. W. Field; directors: Adolf Theobald, Charles H. Lindenberger, Joseph F. Martin, Emil Klesewetter, John Siebert, Louis Siebert, F. E. Drake, A. W. Field and J. R. Lovejoy.

Cumberland Valley Traction Company, Carlisle, Pa.—President, G. W. Cumber, Steelton; secretary, F. H. Alleman, Steelton; treasurer, W. L. Gorgas, Harrisburg; directors: J. L. Kaufman, S. F. Dunkle, John B. Skiles, Dr. H. W. Linebaugh, B. F. Myers, J. J. Baughman, G. W. Cumber, F. H. Alleman and W. L. Gorgas.

Elwood Electric Street Railway Company, Elwood, Ind.—President, J. H. DeHority; treasurer, W. A. DeHority; secretary and manager, S. B. Harting; directors: J. H. DeHority, H. G. Harting, C. J. Taylor, H. C. Callaway, C. C. DeHority, E. O. Heck and W. A. DeHority.

Fair Haven & Westville Street Railroad Company, New Haven, Conn.—President, Henry S. Parmelee; vice-president, Samuel Hemingway; secretary and treasurer, Levrett Candee; directors: Henry S. Parmelee, Samuel Hemingway, John B. Carrington, E. Hayes Trowbridge, George D. Watrous, James S. Hemingway, Wilbur F. Day, Samuel E. Merwin.

Georgetown & Tenleytown Electric Railway Company, Washington, D. C.—President, Oscar T. Crosby; vice-president, J. Hite Miller; secretary and treasurer, William S. Terry; directors: Oscar T. Crosby, H. Bradley Davidson, Charles A. Leib, George E. Emmons, D. M. Myrick, Howard Nynian, W. S. Terry, J. W. Lackey and J. Hite Miller.

Greensburg, Jeannette & Pittsburg Electric Railway Company, Pittsburg, Pa.—President, ex-Judge W. F. Sadler, Carlisle; secretary, M. F. Thompson, Carlisle; directors: W. A. Coffee, H. G. Beetem, Edward Bailey, W. J. Snively, P. Russ and J. B. Kauffman.

Hackensack Gas & Electric Light Company, Hackensack, N. J.—Directors: George W. Conklin, Frank B. Poor, E. A. Pearce, William M. Johnson, Lemuel Lozier, David St. John, Jacob Bauer.

Jefferson Avenue Railway Company, St. Louis.—Directors: Edwards Whitaker, Pierre Chouteau Maffitt, Robert McCulloch, John Scullin and Harry Scullin.

Jeffersonville Gas, Heating & Electric Light Company, Jeffersonville, Ky.—President, E. C. Eaken; secretary and treasurer, A. A. Swartz; directors: E. C. Eaken, A. Swartz, N. H. Myers, T. J. Lindley and J. E. Taggart.

Middletown, Highspire & Steelton Street Railway Company, Middletown, Pa.—Directors: Solomon Zimmerman, S. C. Young, Edward Bailey, J. E. Rutherford, E. C. Felton and George W. Cumber.

Milwaukee, Racine & Kenosha Electric Railway Company, Milwaukee, Wis.—President, Mathew Slush; vice-presidents, A. W. Bishop and W. Greif; secretary and treasurer, George J. Hoffman; directors: Mathew Slush, A. W. Bishop, Racine; George J. Hoffman, N. I. Dryfoos, William Greif, Edward Weberson and Russell Brown, Cleveland, O.

Montville Street Railway Company, Norwich, Conn.—President, Solomon Lucas; secretary, Charles W. Comstock; treasurer, Edward P. Shaw, Jr.; directors: Solomon Lucas, John H. Barnes, Norwich; Edwin O. Johnson, Charles W. Comstock, Montville; Edward P. Shaw, Jr., Brookline, Mass.

Myersville & Catoctin Railway Company, Middletown, Md.—President, Cyrus F. Flook; secretary, George D. Toms; treasurer, John T. Hildebrand.

North Hudson County Railway Company, Hoboken, N. J.—Directors: M. Tierney, E. A. Stevens, Nicholas Goetz, F. J. Mallory, J. Herbert Ballantine, Robert F. Ballantine, Robert W. DeForrest, C. Henry Offerman, Allen L. McDermott.

Philadelphia & Gray's Ferry Passenger Railway Company, Philadelphia.—President, Edward Hopkinson; treasurer, Lewis S. Renshaw; directors: Richard Dale, S. W. Woodhouse, B. Frank Hart, Lewis Elkin, Isaac W. Jeanes and William Dulles.

Pottsville & Reading Electric Railway Company, Pottsville, Pa.—President, F. H. Treat; directors: Thomas B. Prosser, C. P. King, E. L. Nichols, H. H. Pearson, Jr., and M. S. Collingswood.

Roxborough, Chestnut Hill & Norristown Railway Company, Conshohocken, Pa.—President, Robert M. Carson; vice-president, C. Martin Brill; secretary and treasurer, W. H. Hantsch; directors: C. Martin Brill, Henry W. Biddle, George A. Fletcher, Robert M. Carson, John A. Brill, William Ring, Samuel F. Houston, R. Nelson Buckley.

Schuylkill Traction Company, Girardville, Pa.—Directors: Dallas Sanders, George H. Earle, Jr., W. B. Gill, Herbert M. Howe, John A. Johann, Joseph P. Richards and Winthrop Smith.

St. Louis & Suburban Railway Company, St. Louis.—President, Charles H. Turner; vice-president, Samuel M. Kennard; secretary and treasurer, Robert Lehman; directors: James Jackson, James Green, Charles C. Maffitt, Ellis Wainwright, Clark H. Sampson, J. B. Case, J. O. Richardson.

St. Louis & Meramec River Railway Company, St. Louis.—President, Charles H. Turner; vice-president, J. B. Case, secretary and treasurer, R. Lehman; directors: Charles H. Turner, S. M. Kennard, H. Nicolaus, J. B. Case, Ellis Wainwright.

Toledo, Bowling Green & Fremont Railway Company, Bowling Green, O.—Directors: W. B. Taylor, F. J. Hoag, George H. Breymann, M. I. Wilcox, B. Jacoby and James A. Houston, of Toledo, and F. T. Mussey, of Elyria. The number of directors was reduced from 15 to 7.

Utica Electrical Manufacturing & Supply Company, Utica, N. Y.—President, William E. Lewis; vice-president, W. H. Clobber, Jr.; secretary and treasurer, M. Jesse Brayton; directors: William E. Lewis, M. Jesse Brayton, William H. Clobber, Jr., Frank S. Ferriss, W. C. Balda.

West Chicago Street Railroad Company, Chicago.—Directors: Charles T. Yerkes, William L. Elkins, P. A. B. Widener, Harvey T. Weeks, S. W. Rawson, F. H. Winston, J. M. Roach.

York Street Railway Company, York City, Pa.—President, W. H. Lanus; directors: D. K. Trimmer, Grier Hersh, George P. Smyser, John Fahs, L. A. Marshall, Charles Kurtz.

COMMERCIAL PARAGRAPHS.

Messrs. Tower, Dawson & Co. of 806-308 Broadway, New York, are the sole agents for the Franklin Typewriting Machine, which is unquestionably one of the best, if not the best, typewriters now on the market. In the Franklin No. 5, their latest production, is found every quality necessary to make up a perfect machine. It is handsomely made, has an attractive appearance, and moreover, can readily be taken apart for cleaning and easily put together. The writing always being in sight effects a great saving of time. We would call attention to their advertisement, which appears on the second advertising page of this issue, and feel justified in asserting that the claims Messrs. Tower, Dawson & Co. make for their machine are in every respect true. The price as stated in the advertisement is but \$75, and any one investing in the Franklin No. 5 will be getting good value for his money. The company will send a descriptive booklet on request.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

The Prouty Electro-Gasoline Engines, manufactured by E. Prouty, 79 Dearborn street, Chicago, are compact, handsomely made, and of great practical merit. We would call attention to Mr. Prouty's advertisement, which is to be found in this week's issue, and would state that the manufacturer of this engine would be only too glad to have any prospective purchaser examine carefully into the scientific and practical merits of this machine. Contrary to the policy pursued by many manufacturers of this class of apparatus, Mr. Prouty courts a thorough investigation of the working of his gasoline engines, and will cheerfully furnish any desired information regarding the efficiency and capabilities of his machines. Persons contemplating purchasing engines of this nature would do well to open correspondence with Mr. Prouty with a view to getting information on the subject.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

The Upton Midget Long-Burning Arc Lamp is already a very popular specialty. The small size, light weight and tasty appearance of the lamp make it a very desirable arc lamp for inside work, while its positive and steady action and general reliability make it a popular lamp for all places where a long-burning arc lamp is required. The Electric Appliance Company, Chicago, will be glad to send their latest circular on this specialty on application.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

Help to fight the Electrical Trust by subscribing for ELECTRICITY.

INCORPORATIONS.

The Aurora Arc Lamp Manufacturing Company, Pittsburg, Pa. Capital stock, \$1,000. Incorporators: Conrad Weber, Frederick Clausman, William Isensee, A. Schonn and George Schlinder.

The Citizens' Electric Light Company, Winchester, Ind. Capital stock, \$20,000.

The Elwood, Anderson & Lapelle Railroad Company, Elwood, Ind.—to run an electric line from Elwood to Anderson and Lapelle, a distance of twenty-five miles. Capital stock, \$50,000. Directors: D. G. Reid, L. H. Landon, J. E. Hagen, W. M. Leeds, W. B. Leeds, H. M. Davis and C. W. Bennett.

The Nashville Light & Power Company, Nashville, Tenn. Capital stock, \$25,000. Incorporators: C. M. McGhee, L. D. Tyson, N. Baxter, Jr., Shelby Williams and E. G. Connette.

The Hightstown Electric Light & Power Company, Hightstown, N. J.—to supply electric light and power to Hightstown, Cranbury and near-by places. Incorporators: Francis C. Thorn, Delanco; Charles P. Fitch, Bermley; Theodore Nostrand, Philadelphia.

The Delaware Valley Railway Company, Delhi, N. Y.—to construct and operate an electric road from Delhi to Andes and Bovina Center, N. Y. Capital stock, \$150,000.

TELEPHONE AND TELEGRAPH.

Incorporators and directors: Henry Davie, J. R. Honeywell, Samuel F. Wilbur, George W. Youmans, of Delhi; James F. Scott, W. C. Oliver, of Andes; T. E. Hastings and Alexander Hilson, of Bovina Center, and H. S. Sewall, of Walton.

The Armour Electric Light, Fuel & Power Company, Chicago, has certified to a change of name to Alaska Company and to an increase of capital stock from \$50,000 to \$500,000.

The Standard Light & Power Company, Dallas, Tex.—to supply light, heat and electric motive power to the public. Capital stock, \$100,000. Incorporators: Emmett A. Ellis, L. Ashton and C. H. Alexander.

The American Dynamo-Engine & Motor Lamp Company, Memphis, Tenn.—to manufacture and sell dynamo-engines, motors, lamps and electrical appliances. Capital stock, \$150,000. Incorporators: C. C. Cowan, Jere Horne, M. L. Whitfield, John E. Bell and J. S. Williams.

The Braid Electric Company, Nashville, Tenn.—to deal in electrical machinery. Incorporators: J. W. Braid, W. W. Gambill, Thomas Jones, E. C. Andrews and M. C. Woolwine.

The Azusa Electric Lighting & Power Company, Azusa, Los Angeles County, Cal. Capital stock, \$5,000. Incorporators: Orlando H. Huber, Vint M. Greever, Charles C. Casey, Stillman F. De Voin, Evan Davis, John W. Calvert, Thomas C. Bouldin.

The Metropolitan Electric Construction Company, New York City—to construct and equip with electrical apparatus for purposes of transportation and other purposes railways and other works of a public and private character. Capital stock, \$50,000. Incorporators: A. B. Chandler and Edward C. Platt, Brooklyn; Edward H. Johnson, of New York City, and William D. MacQueen and Herbert T. Jennings, of Mt. Vernon, N. Y.

The Lawrenceville Light & Water Company, Lawrenceville, Ind. Capital stock, \$25,000. Incorporators: M. L. Liscomb, F. C. Spring and G. E. Engstrom.

The Burnham-Hall-Chase Company has been organized at Portland, Me., for the purpose of the manufacture, purchase and sale of electrical supplies and specialties, with \$2,000 capital stock, of which nothing is paid in. The officers are: President, Frederic A. Hall of Chelsea, Mass.; treasurer, William W. Burnham of Boston, Mass.—The C. W. Trainer Manufacturing Company also has been organized at Portland for the purpose of doing a general asbestos business and to deal in electrical goods, with \$50,000 capital stock, of which \$5,000 is paid in. The officers are: President, Eugene W. Hough of Boston, Mass.; treasurer, Charles W. Trainer of Boston, Mass.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JANUARY 18, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 597,432. Electric Car-Brake. Constant F. de Redon, New York City. Filed Sept. 22, 1896.
- 597,433. Electromagnetic Railway-Car Brake. Constant F. de Redon, New York City. Filed April 22, 1897.
- 597,467. Trolley Car. Jeremiah D. Hull, New York City. Filed Feb. 1, 1897.
- 597,508. Conduit for Electric Railways. Cyrus V. Osborn, Dayton, O. Filed July 18, 1896.
- 597,516. Electric Trolley Device. Gustaf Valley, Johnstown, Pa., assignor to the Steel Motor Company, same place. Filed March 8, 1897.
- 597,650. Electric Lock and System of Electric Locking for Securing Additional Safety in Railroad Signaling. James F. W. Morris and George Mumford, London, England; said Morris assignor to William Samuel Totill Martin, same place. Filed Oct. 16, 1896.
- 597,693. Trolley-Wheel. Harry B. Sawyer, Chicago, Ill., assignor of one-half to Meyer Wheeler, same place. Filed June 19, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 597,424. Electric-Arc Lamp. Adolphe Mougin, Paris, France, assignor to La Societe les Fils d'Adolphe Mougin Hericourt, France. Filed Feb. 13, 1897.
- 597,492. Filament for Incandescent Lamps. Frank E. W. Bowen, London, England. Filed Aug. 17, 1897.
- 597,586. Signal-Telegraph. Claudius V. Boughton, Buffalo, N. Y. Filed Dec. 19, 1895.
- 597,601. Electric-Arc Lamp. Emanuel Blaser, California, Mo., assignor to Charles G. Corrao, Mattapan, Mass. Filed July 15, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 597,418. Regulation of Dynamo Electric Machinery. Frederic A. Johnson, Binghamton, N. Y. Filed April 14, 1897.
- 597,419. Regulation of Dynamo-Electric Machinery. Frederic A. Johnson, Binghamton, N. Y. Filed April 24, 1897.
- 597,470. Rheostat. Mortimer Norden, New York City, assignor to Joseph Norden, same place. Filed April 12, 1897.
- 597,472. Electromechanical Switch-Operating Mechanism. Charles W. Squires, Springfield, Mass. Filed April 9, 1897.
- 597,567. Transmission-Dynamometer. Stillman W. Robinson, Columbus, O., assignor to Frederick A. Riehle, Philadelphia, Pa. Filed Feb. 27, 1896.
- 597,642. Electric Switch. Everett M. French, Stoughton, Mass. Filed Sept. 16, 1897.
- 597,616. Machine for Assorting Carbons. Harry S. Hart, Chicago, Ill. Filed Aug. 2, 1897.
- 597,700. Circuit-Breaker. Frederick C. Robertson, Toronto, Canada. Filed July 22, 1895.

TELEPHONE AND TELEGRAPH APPARATUS.

- 597,556. Coin-Controlled Apparatus for Telephones. William Gray, Hartford, Conn., assignor to the Gray Telephone Pay Station Company, same place. Filed Dec. 20, 1899.
- 597,587. Telegraphic Signal. James Nicolson, Buenos Ayres, Argentina. Filed Feb. 26, 1897.
- 597,689. Keyboard Telegraphic Transmitter. Samuel Price, Paterson, N. J. Filed June 17, 1897.

MISCELLANEOUS.

- 597,476. Electric Furnace. Thomas L. Wilson, New York City, assignor to the Electro Gas Company, same place. Filed Nov. 15, 1895.
- 597,517. Apparatus for Producing Ozone or Ozonized Air. Albert Verley, Paris, France. Filed Feb. 17, 1897.

Annual Meeting of the Indiana Mutual Association.

The Indiana Mutual Telephone Association held its annual meeting at the Bates House, Indianapolis, on the 19th inst. E. H. Andrews of Lafayette, president of the association, said in his address that the independent telephone business throughout the State is on the increase, both in the number of subscribers to older exchanges and in the number of new exchanges which are being put in.

George W. Beers, of the Home Telephone Company of Ft. Wayne, stated that his company has 1,400 subscribers and 700 miles of wire reaching other towns in Indiana and Ohio. He said that each of the home companies has its local exchange connected with smaller towns near by, and this kind of service is on the increase.

A committee was appointed at the last annual meeting to confer with similar committees of independent associations in Pennsylvania and Ohio. Their report showed that the independent enterprises were carried on in the two States named and in Indiana to a greater extent than in others. In the three States there are 250 independent exchanges, with more than 100,000 subscribers, and the capital invested is more than \$5,000,000. The report said that the demand upon home companies for long-distance service was extending. That this might be met, it was stated that in the three States organizations are forming to further this work; committees from the three States had been appointed. That from Indiana consists of E. H. Andrews, George W. Beers and Hugh Daugherty. The committees had conferred with the Western Union and Postal Telegraph Companies, with the object of forming an alliance of some kind whereby the long-distance lines might be established. But the possibilities are so remote, the committee said, that about the only way to obtain the desired result is to incorporate the independent exchanges of the State into one company, with sufficient capital to build the connecting lines. It was recommended in the committee's report that this movement be taken up at once and developed as rapidly as possible.

The following officers were elected for the ensuing year:

President—E. H. Andrews, of Lafayette.
Vice-President—J. S. Stone, of Rushville.
Secretary and Treasurer—A. E. Reynolds, of Crawfordsville.

Assistant Secretary—W. H. Ernst, of Bluffton.

Executive Committee—E. H. Andrews, J. S. Stone, A. E. Reynolds, George W. Beers, of Ft. Wayne; C. M. Zion, of Lebanon; Elbert Shirts, of Noblesville; A. E. Ramsey, of Crawfordsville.

The stockholders of the Citizens' Telephone Company met lately in Columbia, Tenn., to hear read a financial report from the secretary and treasurer and to consider a proposition made by the Cumberland Telegraph & Telephone Company (Bell) to buy out the Citizens' plant. Dr. Pillow, the president of the Citizens' Company, stated that the company was in debt \$4,410, and that it would require another \$1,000 to place the exchange in first class condition, yet none of those present favored a sale to the Cumberland Company, and the proposition of that company was thrown aside unheard. Roland Gooch said he considered the proposition of the Bell people to purchase a \$13,000 plant for \$4,400, which he understood was the sum offered, as an insult. It was moved that subscriptions be called for and the amount of \$5,500 raised. Prominent men all over the house jumped to their feet and in a little while nearly \$3,300 was volunteered. A committee of fifteen was appointed to canvass the subscribers not present and report at the next meeting. Every means has been used by the Cumberland Company to down the Citizens' Company, but without success. Rates have been reduced to 50 cents per month, but the citizens banded together and nearly all the business houses in Columbia signed an agreement not to allow the Bell 'phone in their houses.

The Athens (N. Y.) News says: "The telephone company here has signed contracts with twenty railroad men, mostly living in Waverly, to place telephones in their residences for the purpose of giving them notice when wanted to go out on their runs. The 'phone connections with the round house at Sayre are being made and the connections with the residences will be made as soon as the work can be done. To start with, the engineers and firemen are putting in 'phones, but the conductors and brakemen will no doubt follow suit very quickly. It looks very much as if the call boy would lose his vocation. It is said that the telephone service will give the men considerable more time to get ready for their runs, as the call boys have a number of men to call most of the time and the last man that he reaches has to hustle to make connection with his train."

In the lower House of the Legislature at Albany on the 20th inst., Assemblyman Cain introduced a bill for the reduction of telephone rates. It provides that six months after the passage of the act the charge for the annual or monthly use of a telephonic communication both by day and night, together with such instruments and electrical apparatus as shall be necessary to transmit vocal messages

between the patrons or subscribers of any telephone company within the limits of this State (which charge and price shall be pro rata for shorter periods) shall be, in cities of one million inhabitants and over not to exceed a rate of \$85 per annum; cities of 500,000 and less than a million, not to exceed \$75; in cities of 100,000 and less than 500,000 inhabitants, not to exceed \$48; in cities of 20,000 and less than 100,000, not to exceed \$36; in places of 8,000 and less than 20,000 inhabitants, not to exceed \$30, and in all cities and places of less than 8,000, not to exceed \$27.

The exchange of the Delmarvia Telephone Company at Wilmington, Del., was recently inspected by a number of representatives of various telephone companies who pronounced it one of the handsomest and most complete in the United States. The exchange is built to accommodate one thousand subscribers, and every device in modern telephony has been adopted. The Delmarvia Company has now about 350 'phones in operation and are putting in new ones at the rate of fifty per week. The rates are \$36 for business houses and \$24 for residences per year. The Bell Company has reduced its rates to meet those of the new company. This has had no effect other than to attach the public to the Delmarvia.

The Pennsylvania Telephone Company at its annual meeting at Harrisburg, held last week, voted to increase its indebtedness for the purpose of making improvements. The following officers were elected: President, Francis Jordan; vice-president, A. R. Shallenberger; secretary and treasurer, J. Heron Crossman, Jr.; general manager, M. H. Buehler, all of Harrisburg, with T. J. Lerch, Reading, general superintendent.

At the annual meeting of the Saugatuck & Ganges Telephone Company, Saugatuck, Mich., it was shown by the secretary's report that the annual cost of maintaining and operating the plant has been \$10.25 per 'phone. It was decided not to sell out to the Ottawa Telephone Company with their promise of a rental of \$12 per year. The service will be extended and the business managed with a view to better economy.

Judge Coolidge recently refused the Bell Telephone Company an injunction restraining the city of Benton Harbor, Mich., from removing its poles and interfering with the construction of more lines. The city some months ago removed the Bell poles, and since that time it has been in the courts. Holland and other Michigan cities have followed Benton Harbor's action.

A six-mile submarine cable has just been completed at Passaic, N. J., for the Postal Telegraph Company. It is the longest of its size ever made in this country and weighs 125,000 pounds. Its diameter is one and three-quarter inches. It will be stretched across Great South Bay between Fire Island and Babylon, giving the Postal a marine service of its own.

The Swedish telephone industry is a Government monopoly. The network includes at present 27,000 instruments, distributed over about 600 stations. The population amounts to about five millions, and as nearly every town is connected, the system is extremely complete.

A company has been organized at Romney, W. Va., to build a telephone line to Cumberland. The officers are: President and general manager, A. B. C. Whitacre; secretary and treasurer, E. V. Parker; attorney, John J. Cornell.

The Chicago Telephone Company's annual statement shows the gross earnings to have been in 1897 \$2,072,000, an increase over the previous year of \$116,250; net earnings, \$624,694, increase \$24,400; surplus, \$104,000, increase \$4,000.

The Mercer County Telephone & Telegraph Company, Mercer, Pa., has elected Dr. L. R. Heath president, G. K. Smith vice-president, J. Alexander secretary, and John Gordon treasurer.

A private telephone line between Dickson and Charlotte, Tenn., will be built by citizens of the two towns as soon as the county court grants them right of way.

A report is current that a Belgian syndicate is about to be organized for the purchase of a Brazilian telephone concession.

The Bell Company in St. Louis began sending messages through the new conduits on the 16th inst.

New Companies Incorporated.

The Washington County Telephone Company, Plymouth, N. C.—to build and operate a telephone line from Plymouth to Criswell and intermediate points. Incorporators: W. H. Ward, B. O. Crinkley, G. W. Roper, E. S. Chesson, T. J. Basnight and J. F. Belarge.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 10½@10¾c.; Lake, 10½@11c.; casting, 10½@10¾c.

The Albany (N. Y.) Railway Company has declared a dividend of 1½ per cent., payable February 2.

The Chicago Edison Company has declared a quarterly dividend of 2 per cent., payable February 1. Books reopen February 2.

The American District Telegraph Company, Philadelphia, has declared a quarterly dividend of 1 per cent., payable February 15.

The Consolidated Car Heating Company, Albany, N. Y., has declared a dividend of 1½ per cent., payable February 15. Books close January 31.

The purchase of a single 100 shares of Edison Electric Illuminating of New York one day last week put that stock up 5 points, the transaction being made at 135.

The Dry Dock, East Broadway & Battery Railway Company of New York has declared a quarterly dividend of 1½ per cent., payable February 1. Books reopen February 1.

The Brooklyn Heights Railroad Company is seriously considering a change of motive power on its cable road from Fulton street to Wall street ferry. The underground electric system is under advisement.

C. S. Sergeant has been appointed second vice-president and Joseph H. Goodspeed comptroller of the Boston Elevated Company. These gentlemen were respectively general manager and treasurer of the West End Company.

It is reported that a new company is to be formed in Philadelphia for the purpose of getting control of all the electric light companies. The company is to have a capitalization of \$15,000,000 and will issue \$15,000,000 debenture 5 per cent. bonds.

Justice Maddox in the Supreme Court in Brooklyn, N. Y., has granted a formal order giving the Kings County Elevated Railroad permission to make connections with the Brooklyn Bridge in the manner proposed and approved by the bridge trustees.

Hon. J. D. Vandeman has been appointed receiver of the Electric Railway Company of Delaware, O. The road has an indebtedness of \$24,000 against it, which has given rise to discontent among the stockholders, and will be appraised and offered for sale at once.

The Montgomery (Ala.) Light Company's plant has been sold under a decree of the U. S. Circuit Court in a foreclosure suit. The property was bought by Bernard Kahn, Charles M. Slagle and Frank J. Hambleton of Baltimore, as commissioners of the bondholders, for \$258,900.

A semi-annual dividend of \$3.50 per share has been declared on the preferred capital stock of the United Electric Securities Company, Boston, payable May 2 to stockholders of record April 20, 1898. Transfer books close at the close of business April 20 and reopen May 3.

In the New York Assembly on the 18th inst. Mr. Sullivan introduced a bill for the regulation of prices to be charged for electric light in cities, the maximum charge to be three-quarters of a cent per light per hour for incandescent and 4 cents per hour for each arc light.

The Metropolitan Street Railway Company, New York, has completed the lease of the Second Avenue surface line. It had previously secured control of the stock by purchase of about five-sixths of it. The lease is for a long period, on the basis of 8 per cent. for the first three years and 9 per cent. thereafter.

The Olcott Reorganization Committee of the Brooklyn (N. Y.) Elevated Railroad gives notice that in pursuance of the plan of reorganization heretofore announced, a first installment of 25 per cent. of the amounts to be paid by the various security holders is payable at the offices of the Central Trust Company, 54 Wall street, February 7.

President William A. Gaston of the Boston Elevated Railroad Company outlined the plans of his company at the recent dinner of the Merchants' Club in Boston. He said the motive power will be electricity; that it will be gotten from a third rail; that the cars in a general way will resemble the cars in use in New York, and that the free transfer policy will be used generously.

A bill has been introduced in the Assembly at Albany to permit the Long Island Railroad Company to operate a surface line on Atlantic avenue, Brooklyn, after its present tracks are put underground. The underground system, according to a plan devised for the company, will connect with New York at Maiden Lane by means of a tunnel under the East River and be extended underground to 42d street in that city.

The Edison Electric Illuminating Company of Brooklyn reports gross earnings for December of \$93,657, an increase of \$11,497 as compared with the same month in the previous year, and net \$48,605, an increase of \$1,401. For the year ending December 31 the gross earnings were \$888,729, an increase of \$62,178 as compared with the corresponding period of the previous year, and net \$370,098, an increase of \$27,940.

The Chicago city council has now before it an application for a franchise from the Wisconsin Island Lakes & Chicago Railway Company, which proposes to construct a trolley railway from Chicago to Wisconsin lake resorts, and offers \$550,000 for a city franchise; another from the Chicago Central Electric Railway Company giving it a loop on the West Side with an entrance to the downtown districts, and a third from the Chicago City Railway.

In a recent interview Manager I. D. Barten of the Brooklyn (N. Y.) Elevated Railroad stated that published statements to the effect that electricity as a motive power was about to take the place of steam on the various lines operated by the company was somewhat premature. Such a thing was certainly in contemplation, but no contract had been signed or entered into although various plans had been submitted and were under consideration.

The Edison Electric Illuminating Co., New York, reports gross earnings for December of \$286,740, an increase of \$40,465 as compared with the same month of the previous year, and net \$157,410, an increase of \$24,291. For the year ending December 31 the gross earnings were \$2,492,371, an increase of \$244,933 as compared with the corresponding period of the previous year, and net \$1,267,230, an increase of \$172,880.

The Guaranty Trust Company informs holders of Atlantic Avenue Railroad Company (Brooklyn) 5 per cent. improvement bonds and Brooklyn, Bath & West End Railroad Company 5 per cent. general mortgage bonds that the syndicate formed for the purpose of participating in the readjustment of the bonded indebtedness and leasehold interests of the Nassau Electric Railroad and Atlantic Avenue Railroad Company having purchased more than two-thirds of the above named bonds at 85 and accrued interest, they are authorized to offer the same price to holders of any of the remaining bonds, provided they are deposited on or before February 1.

The Governor of New Jersey having declared the franchises of the Electro-Pneumatic Company forfeited, John I. Waterbury, William A. Dick and Bernard M. Baruch, at the request of the holders of a large amount of stock who believe that the patents owned by the company contain fundamental principles of pneumatic tube transportation, have consented to act as a committee to protect the stockholders' interests. Stockholders are requested to deposit their holdings, indorsed in blank, with the Manhattan Trust Company, under the terms of a protective agreement, paying to the trust company 20 cents per share to meet expenses.

electricity he will save the people whose water pipes are being destroyed by electrolysis a great deal of annoyance and expense. He may also so reduce the operating expenses of his company that the telephone rates may be reduced without impairing its handsome dividends. But perhaps the street car companies will object to supplying the Bell Telephone Company with electricity, and may discover that it would be a wise business move to put in a metallic circuit and save for their own use the electricity now wasted in the earth. In this event the street car magnates may find it possible to save enough to reduce fares.

"Merely as an exposure of a crude, wasteful and destructive method of handling electricity as a motive power, Mr. Durant's discovery is valuable."

As the last paragraph states, this discovery is principally valuable as showing the wasteful and inadequate methods adopted by the street railway companies in St. Louis.

* * *

New Method of Insulating an Electric Current.

As is well known, there is a limit to the distance electricity can at the present day be economically transmitted even at an exceedingly high potential, owing to the loss which occurs over long distances in overcoming the resistance of the conductor. The problem of conveying even a high potential alternating current, say 100 miles from the point at which it was generated, has as yet not fully been worked out. This is an all-important question, for if current could be generated at various points where suitable water-power was available, and then distributed far and wide throughout the country for manufacturing or lighting purposes, there would be an immense annual saving in fuel. This is what electrical engineers have been striving to accomplish for some time. An inventor in Chicago has recently devised a means of transmission which he claims will operate economically over any distance. His aim would seem to be not so much to reduce the actual resistance of a conductor as to prevent any loss through radiation or induction. Mr. Archibald J. Robertson, the originator of this method of insulation, makes the following statement regarding his device in a recent issue of the *Chicago Tribune*:

"With all deference to the promoters of the present lines of transmission carried on aerial supports, I will say that that system is at best but a makeshift. Further, I venture to assert that, even were it possible to transmit on aerial supports over great distances, which it is not, legislation in the various States throughout which such a line would pass would act against it as soon as legislators were made aware of the danger attending the transmission of heavy currents. Again, the cost of maintaining long lines on aerial supports would be so excessive as to render such lines uncommercial. It is admitted by all practical men that, for heavy currents, underground lines are preferable; but underground lines hitherto have been defective. Why? It is impossible to keep the conduit or duct which carries the conductor dry. Induction and loss of electric force are inevitable consequences. It is to this defect that I have devoted some time, money and thought, and this invention is the result."

The device consists in inclosing the electric conductor in a train of underground tubing of insulating material from which the air has been exhausted. This is to be accomplished by means of exhaust pumps placed from fifteen to twenty miles apart along the line. The duct, according to the inventor, should have an internal diameter of about four times that of the conductor. The latter is to be held in the center of the tubing by means of insulators spaced at short intervals apart. The tubing should consist, as previously stated, of insulating pipe in three-foot sections, and of two diameters to permit of their telescoping. The joints between the

inside pipes may be made to lie under the respective centers of the outside pipes or vice versa; in this way the outer pipe would afford a protection to the inner joint. The internal diameter of the outer pipe should slightly exceed the external diameter of the inner one, thus reserving a space for sealing. All the joints and spaces just mentioned are sealed with asphalt, which is poured in through an orifice left for the purpose in the outer pipes.

As can readily be seen this operation in a long line extending over miles of territory would be exceedingly tedious and entail an enormous amount of labor.

After the line is complete, the inventor proposes to exhaust the air from the conduit in the direction of the current. His object in so doing is to aid its progress, on the principle that wind aids the progress of sound waves. In order that the exhaust system should always be in the direction of the current, the duct is sealed around the conductor at each pumping station. This seal should be extremely thin and a good insulator. To allow of a constant suction an infinitesimal quantity of air would be admitted at each station by means of a trip valve. It is proposed to control the latter by a spring which would admit the air at a given pressure. The inventor's claim is that, by exhausting the air, there would necessarily be an absence of moisture, and consequently no chance of any current escaping from the conductor through radiation. It is further proposed to supplement this drying process by placing at frequent intervals in the conduit unslaked lime which, as is well known, is an absorbent of moisture. Regarding an electric conductor protected in the manner described, Mr. Robertson is credited with having made the following statement:

"An electric conductor under these conditions is absolutely dead to every outside impulse. I do not hesitate to assert my belief that such a line will transmit electricity any distance without the slightest loss."

This last statement would certainly seem to be a rather sweeping one. If the inventor means that there would be no loss through radiation or induction this might possibly be the case provided every part of the system worked in a satisfactory manner, but even then there would still be the line resistance to overcome, which would limit the distance to which current could economically be transmitted. Moreover, the whole arrangement is exceedingly complicated, and would require constant attention to prevent a leak occurring, the pumps from getting out of order, or some other unforeseen accident happening. The frequent renewing of the unslaked lime alone over a long distance would require considerable labor. When all these points have been taken into consideration, it will probably be found that the extra cost of labor such a system would entail would far outweigh any advantage this method might have over a well insulated cable for the transmission of a current. What is more especially needed is not so much a method of insulating the conductors now generally in use as the discovery of some new material or combination of substances with no greater resistance than copper at about one-fifth the cost of that metal.

The inventor of this pneumatic insulating device seems to think that his system would be especially applicable to mining operations in Alaska, enabling an electric current to be transmitted over any distance from natural sources of power. According to a press report, an Eastern company is now being organized with a capital of \$5,000,000 for the purpose of putting the Alaska scheme into operation. If such is the case, it might be well for any prospective investors to insist on a thorough trial of this system being made, say between Niagara and New York City, where climatic conditions would not materially enter into the problem, before embarking in the Alaska enterprise too heavily.

Electricity for Consumption.

A well known physician, Mr. J. Mount Bleyer, is said to have discovered a method of curing consumption by the use of an electric current. This system is as yet not thoroughly perfected, but the experiments he has so far made have been very successful, so it is claimed. Dr. J. Mount Bleyer made the following statement regarding his method, which appeared in a recent issue of the *New York World*:

"I claim that this is the most scientific and most important discovery since Koob's bacilli. It is destined to stay, and not like all the recent forms of treatment, which are only based on theoretical philosophy and not on pure physical laws. There is no pain whatever connected with the application of electricity, as a great quantity of current is used and distributed on a large surface of electrodes."

Dr. Bleyer's system is based on the well known principle that electricity can be made to act as a purifying agent by virtue of the ozone which it gives forth under certain conditions. Water and sewage have frequently been treated in this manner both in this country and abroad with excellent results. To cure consumption Dr. Bleyer has availed himself of this same principle, and revivifies the blood of a patient by giving it ozone. To accomplish this he places pads on the patient's chest directly over the diseased portion of the lung and a pad on the corresponding point in the back. Then a current of electricity at extremely high voltage is sent directly through the body for twenty minutes or half an hour. Regarding the voltage used, Dr. Bleyer says:

"I am not yet ready to say what amount of electricity I use, as I do not wish inexperienced professionals to make the experiment, with perhaps fatal results."

By this means the dead tissue of the lung, which is the cause of the disease, is said to be gradually destroyed and the patient gets rid of it by expectoration.

It has been proven by experiments on rabbits that the electric current really revivifies the blood by giving it ozone. Advanced stages of this dreaded disease cannot be cured by the application of electricity, but it is claimed that such patients as possess certain vitality and enough of the lung substance to carry the physiological processes are susceptible of an absolute cure within a reasonable space of time by the daily application of the current.

Any means that can be devised for successfully combating this terrible disease will unquestionably be of inestimable value to humanity.

Under the Searchlight.

Notes and Comments on Various Topics.

Bernstein Electric Co.

As we went to press last week we were advised that the Bernstein Electric Company of Boston had made an assignment, but before stating the fact we were anxious to present to our readers some sensational developments regarding this concern and its actions. As is well known, this company confined itself almost exclusively to the manufacture of incandescent lamps under patents of Mr. Bernstein. As far back as the Franklin Institute Exhibition in Philadelphia in 1883, Mr. Bernstein had been making more or less progress in the direction of lamp manufacture, but the product of his factory did not attract commercial interest, due to the fact that the lamps he made were mostly of high candle-power and were unsuitable to the uses of the trade generally; they were, however, used to some extent for series lighting.

In 1888 the present company was incorporated with a capital stock of \$100,000, and the plant was mortgaged in 1889 for \$100,000. At about this time Mr. Henry B. Cram became general manager and Mr. Charles A. Coffin and others of his following were

interested parties. Shortly afterward the Bernstein Electric Company manufactured a brand of lamps for the Alexander, Barney & Chapin supply house which was known as the "A. B. C." brand. With the failure of the Alexander, Barney & Chapin Company the Bernstein Electric Company lost a valuable customer, and in spite of all the hustling Mr. Cram could do the company did not prove a financial success. The manufacture of small fan motors was then taken up, but this too proved unsuccessful, and after a varied experience Mr. Cram retired from the management a little over a year ago, and was succeeded by Mr. Bradley, who also retired as manager a few days before the company's failure. There are many ugly rumors afloat regarding some of the inner transactions of parties interested in this company. The Lamp Pool by reason of this failure loses one of its members. An attachment from Steuben County against the Bernstein Electric Company of Boston for \$1,459, in favor of the Corning Glass Works, is in the hands of the sheriff, and others will doubtless follow. We wonder what explanation Mr. Coffin will have to make for the collapse of one of his pet concerns.

As the Count of Monte Cristo says at the disappearance of his first enemy—"One." Who will be the next of the unpopular Lamp Pool?

Stockholders Growing Restless.

(From the Boston Advertiser.)

There continues to be much newspaper talk respecting the plans of the General Electric management in connection with the back dividends due on the preferred stock. According to late gossip, enough is known about the business of the company to warrant the assertion that it has enjoyed a prosperous year, and that its earnings above charges are sufficient to justify payment of dividends on both the preferred and the common shares.

The company owes about \$1,265,000 accumulated dividends on the preferred stock, and until this amount is paid off nothing can be distributed to the common stockholders. The company for some time has been buying its 8 per cent. debenture bonds in the market, until it is now said to hold about \$2,000,000 of them in its treasury. These bonds, it is declared, have not been cancelled, but are held as assets and could be reissued if desired.

In these circumstances the preferred stockholders are decidedly restless, and insist that it is time for the company to clear off its obligations to them. The common stockholders are likewise impatient at a policy which blocks the way to a resumption of dividends on their holdings. The preferred stockholders have received nothing since January, 1894, and nothing has been paid on the common stock since August, 1893. Both classes of stockholders have received promises from the management that some disposition would be made of the accumulated preferred stock dividends as soon as the times warranted it.

Great pressure is being brought upon the company's managers to take action, as the finances and outlook of the company are believed to justify such a course. It is said by some persons who claim to be acquainted with the affairs of the company that it is now so well supplied with business contracts that it may not deem it desirable to compete actively for any of the preliminary contracts for the electrical equipment of the elevated railroads.

The company's management considers it wise to conserve its present cash surplus, but there is a willingness to cancel the back dividends on the preferred stock by the reissue of debenture bonds held in the company's treasury. It is confidently expected by certain large interests in General Electric that this plan will be definitely formulated within a short time.

That is certainly rich. The General Electric Company doing such a large amount of business that it really does not care to compete actively for any of the preliminary contracts for equipping the elevated roads with electricity! This statement must either have been made with a view to forewarning their stockholders, so as to lessen their disappointment at their not getting it, or because, with the shadowy margin of profit this concern usually allows itself, they are afraid of losing too much on the contract. Not to want a thing that one can't possibly get is a spirit that is always to be commended.

* * *

We now hear of a man who prides himself on having at three different times received a shock from a 1,000-volt alternating current—one of which lasted

twelve minutes—without any evil effect resulting. Were all persons built on this same plan, some other method of executing criminals would have to be devised for the State of New York.

* * *

Power for the Whole World Except Philadelphia.

We take pleasure in publishing the following communication from a correspondent, and as we failed to have it copyrighted have no objection to some of the dailies copying it provided credit is given:

Editor ELECTRICITY.

I wish to inform the Universe that I have made the most important discovery of the 19th century. It is not my intention to patent it, but to give it to the world free of charge, and my object now is to let everybody know of my discovery, in order to prevent unscrupulous persons from stealing and patenting it, and thus depriving mankind of its benefits.

I have found by a scientific calculation that every cubic mile of heated matter of the earth's interior contains enough heat to supply twenty million horsepower for a year, or the equivalent of 400 million tons of coal. My discovery came about in this way. One day I was sitting and thinking, that is, my mind was in a rapid train of thought. I was trying to find some way to prevent the destruction of the human race by the constant increase in the percentage of carbonic acid in the air, due to the burning of so much coal, which I am told by scientists will in a few hundred thousand years make the oxygen so scarce that it will be only within the reach of millionaires who live in sky-scrapers.

While pondering on this momentous question, an idea suddenly struck me. I saw all at once that Nature had put this inexhaustible store of energy in the earth for the special use of man. All it needs is a five-million dollar syndicate to tap this great reservoir and supply the whole world with power. I would undertake the construction of the plant at a reasonable salary. My idea is to run copper and iron wires, a foot in diameter, from the equator to the north pole through the great centers of population. By soldering the copper wires to the north pole and the iron wires to the equator we could get a powerful thermo-electric battery, the center of the earth being the hot junction and the polar region being the cold junction. The central part of the earth, being composed mostly of metals whose average density is 5.5, would have very little resistance. These wires could be tapped for electricity at any point between the equator and the pole by connecting the motor or other translating device between a copper and an iron wire. It might be possible to dispense with the iron wires altogether and use the ground instead. With a few hundred of these wires running from the equator to the pole and properly distributed over the earth's surface, we might use electric heat to thaw out the frozen plains of Siberia and British America, thus bringing the Klondike into a temperate or even into a torrid zone. The vast snow-covered plains of America and Asia would become fields of verdure, supplying food and raiment for teeming millions of people.

I am aware that certain quasi scientific critics would object that this would use up the internal heat and cool off the earth so that it might become uninhabitable sooner than by the depletion of oxygen going on at the present rate. But I have another idea that provides against this difficulty. The great frozen deserts of Asia and America could be utilized to raise corn-pith cellulose enough to surround the whole world with a shell ten feet thick of this admirable non-conductor of heat. This shell could be built in sections and held up by a suitable system of iron towers, and covering the whole earth it would practically prevent all loss of heat. It is known to be a scientific fact that all electricity is eventually changed into heat, and under this non-conducting shell of corn-pith we could live without the aid of light and heat from the sun.

I would like to add that my plans have been care-

fully examined by experts with a big E, who admit that the system could be made to reach and supply all parts of the northern hemisphere except Philadelphia, where I am told the United Gas Improvement Company will continue to supply light, heat and power for all time to come, using chloride accumulators and Bates thermic engines, with corn-pith cellulose to burn. Yours very respectfully,

Menlo Park, N. J.

W. IZARD, JR.

P. S.—My father was also a great man in his day.

* * *

Altogether the year 1898 could hardly look more promising. We are in "bull" times, and while reactions will occur when the market becomes temporarily overbought, the power to absorb stocks, already in evidence, will increase as speculative sentiment broadens.—*Boston News Bureau.*

The fact that we are in "bull" times cannot well be disputed, otherwise some stocks that are practically worthless would not be quoted at what they are. In the case of the General Electric Company the purchasers of their securities absorb the stock all right while others absorb the dividends—when there are any. Their principle apparently is that a fair exchange is no robbery—you take the rind and I take the core.

* * *

We reprint this from the New York World, with apologies to Mr. Edison:

The world does not know that in addition to possessing an inventive genius to a remarkable degree, Thomas A. Edison has also a keen sense of humor. Those who know the Wizard best are aware that he is ever ready to listen to a good story. Edison himself has said many things that are worth repeating, as is indicated by the following:

A number of buildings in Orange, N. J., had been struck by lightning. Some of the deacons of a local church feared for the safety of the edifice in which they worshipped, and suggested that the church building be equipped with lightning rods. Others among the deacons opposed the suggestion, on the ground that lightning rods were of no practical value.

The discussion resulted in one of the deacons, a pompous individual, being appointed a committee to learn all he could on the matter and report. The deacon decided to interview Edison, as the latter was an unquestioned and high authority on matters electrical.

Edison was very busy when the deacon called and insisted on seeing him.

"Mr. Edison," the deacon began with a flourish of his hand, "I don't believe lightning rods on a building are of any value, do you?"

"What sort of building?" asked the Wizard, impatient to be away.

"Well, on a church for instance."

"By all means," answered Edison quickly. "Providence is absent-minded at times."

The Stanley Electric Manufacturing Company.

The annual meeting of the Stanley Electric Manufacturing Company of Pittsfield was held last evening and the reports were gratifying. The business of the past year has been very prosperous, and for a good part of the time their extensive shops have been run overtime. The shipments show a decided increase over last year, or about 12½ per cent., and more orders to begin the new year with than they have ever had before. The gross profits for the year are reported at over \$100,000. A dividend of 6 per cent. was declared, payable April 1 to stockholders of record January 25. The stock is quoted at 130. The Stanley Company's machinery sells for a higher price than any other similar concern's of the class that is made, and the payroll is about \$3,000 a week.

Pittsfield is pleased with the prosperous company in its midst doing a business the past year of about \$600,000. The old officers were elected as follows: President, W. W. Gamwell; treasurer, George W. Bailey; general manager, John H. Kelman; general superintendent, Henry Hine; electricians, C. C. Chesney and John F. Kelly; directors: William W. Gamwell, William A. Whittlesey, William R. Plunkett, Walter F. Hawkins, Henry Hine, George H. Tucker and George W. Bailey. The company's machines are in active demand, going to foreign countries, including Japan, and four large ones were shipped to California yesterday. The company also maintains a large shop in Canada for English and Canadian trade.—*Springfield Republican, Jan. 26.*

THE PRESENT EFFICIENCY OF INCANDESCENT LAMPS.*

BY JOHN E. RANDALL.

The present efficiency of incandescent lamps for central stations lies somewhere between 3 watts per candle-power and $3\frac{1}{2}$ watts per candle-power. It might appear from these limits that no advance has been made in the lamp industry during the last thirteen or more years of its extensive growth. As long ago as 1885 we heard of $2\frac{1}{2}$ watt lamps, and $3\frac{1}{2}$ watt lamps were considered a regular article of commerce. At the Detroit meeting of the National Electric Light Association in 1887, a $1\frac{1}{2}$ watt lamp was described. As no one in the business is advocating longer life than was claimed ten years ago, it would appear from the figures named above as if the manufacture of incandescent lamps had retrograded and was approaching the state of a lost art.

If the falsity of this supposition were not demonstrated every night, one might be pardoned for thinking the industry was disintegrating.

Every investigation of claims for extremely high efficiency has shown that there was some hocus-pocus—either the candle was of the wax taper variety or the watt was not one of the family that James made famous, or else the lamps didn't live to tell the tale.

Finally the people forgot about the 1 watt and the 2 watt lamp, and concluded to take what they could get, which might be anything from 3 watts to 5 watts, depending upon what the maker had ready to send. It really was a matter of small moment whether the lamps were 3 or 5 watts per candle, since they all went to 5 watts the next day after they were placed in circuit.

This state of affairs has continued with some improvement until a comparatively recent date. In the meantime elaborate series of life tests were made under the auspices of the Franklin Institute; Mr. W. H. Pierce made an extended test; several foreign tests appeared, and tests were made at the Ohio State University of samples from thirteen different makers. There was nothing promising in the general results of all these tests, and for a time the outlook was rather gloomy. Progress was being made however, although the results were not published. It was found that lamps whose initial efficiency was less than 3 watts per candle-power would not last a reasonable time on commercial circuits. This set the maximum limit of efficiency. The minimum was set by what the people would accept and it was placed at 4 watts. More recently all energies have been exerted to produce types suitable for the various kinds of uses. We have now the highly efficient central station lamp, the isolated plant lamp, and the railway type, besides numberless modifications for special uses.

Among the lamps in the Franklin Institute tests was one Weston tamadine (16) that maintained its brilliancy and gave most excellent life. It was the only one of the type, and almost the only one in the test that gave any indication of good quality as quality is gauged at present. As far as that test went the tamadine lamps were a commercial failure, yet this one lamp showed what might be gotten from a cellulose filament. Since then the cellulose filament has been brought to a degree of perfection far surpassing the prototype. While made by a process differing from Mr. Weston's, the present filaments possess all the good features to be found in this early lamp and have outgrown most of the poor ones. Upon the quality of this cellulose filament I base a claim that the present efficiency of incandescent lamps is better than it ever has been, and is so much better that the lighting industry is to be congratulated.

The incandescent lamp is still a filament of carbon of high resistance, hermetically sealed into an exhausted glass globe, with conducting wires passing

through the glass. Its quality as an illuminant depends directly upon the quality of the filament and the quality of the vacuum.

The object of the vacuum is three fold :

1. To reduce the energy expended per unit of light emitted, because of the heat lost through convection.

2. To prevent injury to, and destruction of, the carbon by burning.

3. To prevent injury by abrasion or so-called "air-washing."

Any gaseous envelope will carry away the heat-energy from an incandescing body so rapidly that a great amount of power must be supplied to maintain its surface at a temperature corresponding to a certain brilliancy, the core being at a far higher temperature. This loss becomes less as the pressure of the surrounding gas is decreased, until a point is reached beyond which no further changes can be detected. When the vacuum reaches one part in 1,000 the loss becomes extremely small, and after a vacuum of one part in 10,000 is reached the loss is negligible so far as our present methods of measuring light can determine.

Some years ago we made a series of measurements showing the relation between the degree of vacuum and the power necessary to produce a definite candle-power from a lamp filament. The net results showed that, so far as the convection losses are concerned, the degree of exhaustion ordinarily found in incandescent lamps is better than need be.

Carbon at high temperature cannot resist the attacks of oxygen. Therefore all oxygen must be eliminated, even slight traces causing injury to the carbon surface. We would naturally suppose that the residual gas was composed of oxygen and nitrogen, in the proportions found in air. The induction coil shows that such is not the case, and I believe that in a properly exhausted lamp, although no other gas may be purposely admitted to displace it, no oxygen remains. It is known that a filament will rapidly decline in brilliancy if the vacuum is low, because the radiating surface is injured, but it will not burn out. Very few lamps burn out because of poor vacuum unless cracked, when, of course, fresh oxygen is constantly admitted.

While the effects of abrasion formerly were considered of importance, my experience indicates that, at present at least, they are of small consequence. A high degree of exhaustion, as measured by a vacuum gauge, is not the object to be attained; an unchanging vacuum is essential to the maintenance of the highest brilliancy. In the type of lamp made five years ago a positive injury resulted if the vacuum were made too high. The disintegration of the filament, due to evaporation of carbon, not only injured its surface but seriously darkened the bulb.

The vacuum does not grow poorer with age provided the lamp is properly made and exhausted in the first place. The vacuum changes as the lamp is burned, and a part of the lamp maker's art is to reduce these changes to the smallest degree. But the vacuum is finally higher than at the start. Nothing is tighter than the glass and wire joints of a properly made incandescent lamp. Absolutely no leak can be detected after years. In some lamps used for at least twelve years in rheostats where the current at times brought them to full brilliancy the vacuum was as good as when first made.

Many think that all lamps gradually lose their vacuum. This mistaken notion was caused, no doubt, by a fault common to many individual lamps having the old form of seal at the base, and illustrates the influence which apparently unimportant details exert upon quality, as well as the necessity for wide information and extended experience in successfully making lamps. The present lamps, made by modern methods, have perfect joints, or else the leaks are so bad as to be instantly discovered by proper inspection.

The filament is the most important element of the lamp, so far as efficiency is concerned. Filaments

are now made from a form of cellulose reduced chemically to an amorphous state.

Not many years ago, when the bamboo carbon was supreme, we had occasion to complain about the poor quality of a certain lot of bamboo strips which we had received from an importing firm. They said they could not guarantee a natural product. This furnished the key to the success of the cellulose filament. Art replaces nature, breaking down the structures of a fiber, reducing it to a protoplasmic condition, then spinning a thread radically different in appearance and character from the original material. Instead of whittling down a stock to make a lamp filament, we now cause the filament to grow.

The quality of the filament is determined by the thread. The process of squirting threads is controllable if proper skill, experience and appliances are employed. Yet the weather is more controllable than is the quality of the product when any of these requisites is lacking. It is easier to shave down strips of bamboo to a uniform size, or to weave braids of silk fibers that will appear to be even than it is to squirt a cellulose thread of uniform diameter, but the bamboo strips and the silk braid will not be uniform in weight. They cannot therefore make uniform carbons.

It may be supposed that the coating of carbon applied in treating the filaments fills up the pores and depressions, thereby correcting the defects due to irregularities in texture and surface. This is not true. A poor base carbon cannot make a good lamp. When one filament is found to be better than another, its superiority can be attributed to the base carbon.

In purity, density, surface polish and uniformity, the features that determine quality and maintain efficiency, the cellulose filament, properly made, far exceeds any other kind.

A graphitic coating covering an amorphous carbon body, in a vacuum, is, so far as known, the best combination for fulfilling these conditions. The science of lamp making consists in knowing how the carbon body can be formed, how the graphitic coating can be given and how the vacuum can be produced. The art of lamp making consists in doing these things perfectly and uniformly a thousand times over every day.

Whenever lamps are found to be uniform in voltage and efficiency they are found to be good. In all their minor features recently made lamps are superior to those of older dates. They are uniform in shape and neater in general appearance. The caps are securely attached and more durable in every way. They are entirely fireproof and nearly moisture proof. The bulbs are clearer, cleaner and alike in shape and size. The carbons are placed in the bulbs so as to be more effective and more symmetrical. The connections, both within and without the bulbs, are more secure. Cracks and poor vacuums have about disappeared.

These features help the service that can be derived from the lamps. They form part of the general economy of operation, and therefore influence the efficiency to the extent of being more satisfactory and reliable.

Another point worthy of consideration is the evolution of types suitable for the different conditions of service: one for close regulated central stations, one for poorer regulation and isolated plants in general, one for street railways and other purposes in which, for certain reasons, the service is severe. Added to these are the almost innumerable varieties for special uses, such as window decorations and signs. Finally the use of cellulose has made the 220-volt lamp a commercial possibility.

It may be claimed that the new lamps are more delicate than the older bamboo, in that they cannot be run as long before the filament will break.

The principle upon which all practical methods of illumination are founded, that of incandescence—excessive activity—limits the period of effective ser-

* Paper read before the Northwestern Electrical Association, Milwaukee, Wis., January 19-21, 1898.

vice and induces early destruction. We may as well accept the condition of limited life in the case of the incandescent lamp, knowing that no other light is better in this respect if all factors are considered.

I am not willing to admit that the cellulose filament is more delicate, either in transit or in service. Under identical conditions it will live longer than any other form of filament. Furthermore, the individual life approaches nearer the average than has been the case with any other material. Any carbon filament which will not maintain its brilliancy should live to a good old age.

The life of cellulose lamps at three watts per candle-power should not be compared with bamboo or silk at four. The four watt cellulose railway lamp is giving more satisfactory service than those of other materials. Their light is more uniform and they last longer.

Recent lamps are approaching the ideal one which, when its work is done, breaks and thus announces its own "smashing point." The best proofs of any claim are those based upon actual performance. In support of the claim that the present efficiency of incandescent lamps is more satisfactory than the past, I submit some comparisons.

In the subjoined table are results of tests made

end of the period. For example, if a cellulose lamp whose candle-power is 16 at the start and whose economy is 3.2 watts per candle-power is in service for 500 hours, it will average 15.17 candle-power during that period, but will give less than that value at the end. If a 50-volt bamboo lamp of the same brilliancy and economy is used for the same length of time, its candle-power will average 14.2. The 110-volt bamboo will, under the same conditions, average only 10.4 candle power. In the latter case especially the great change in the brilliancy of the lamps after they had been running for a short time would be very noticeable. Viewed in another way: If a station furnishes a service of 50 cellulose lamps to one customer, and to his neighbor a similar number of 110-volt bamboo, charging the same for each service, the one would be justified in demanding that his lamps be renewed every 100 hours in order to keep his place as bright as his neighbor's.

A 50-volt bamboo lamp, to maintain the same average brilliancy as the 3.2 watts cellulose during any period from 300 to 700 hours' service, should have an initial efficiency of 3.4 watts per candle-power. A 4-watt 110-volt bamboo would not maintain its brilliancy as well as a 3.2 watt cellulose.

While none of the lamps involved in the tests

ELECTRICITY IN MUNICIPAL ENGINEERING.*

BY PROF. R. B. OWENS,
University of Nebraska, Lincoln, Neb.

My object in presenting this paper is to emphasize the economy which can often be effected by generating at one point all the power required by a municipality, and its distribution for whatever purposes, by electrical means.

But I am not to be understood as advocating the community ownership and operation of any interest which can be as well administered by individuals. On the contrary, I believe the vicious efforts, so noticeable of late, to shift individual responsibility to that popular misconception, "the Government," marks the beginning of another serious setback to the growth of democratic institutions.

However, I will not attempt a discussion of private versus public ownership, even the phase presented by the lighting question. I only wish to show the economy of combining the several problems in municipal engineering involving the use of power, and to point out a further considerable field for the use of electrical apparatus.

The several principal problems referred to are, of course, the supply of water for potable and other uses, the disinfection and disposal of sewage, the destruction of ash-bin refuse, and street lighting.

When a city is so fortunate as to be able to get good water from a nearby river or lake, with or without pumping, much that I have to say will not apply. But in the majority of cases in our flat western country water is only obtainable from wells, driven or dug, and when a considerable amount is required, as for municipal uses, it is generally necessary to separate the wells as far as practicable, because of the limit to the supply which can be continuously obtained per unit of volume of water-bearing strata.

In small towns of a few thousand inhabitants, where the underflow is good, it is usual to find driven wells ten to twenty feet apart and a direct-acting steam pump over each, an arrangement which as a rule requires the construction of a railway siding for rapid coal supply. In cases of this kind I have recommended power pumps driven through a countershaft by an engine of economical design. To the same countershaft one or more dynamos can of course be attached. Now if both dynamos and pumps are driven by clutch pulleys, it is possible by shutting down pumps as dynamos are started, and varying the number in operation as lighting load varies, to keep an almost exactly constant load on engine—the most favorable condition for its economical operation.

In larger towns of from fifty to sixty thousand inhabitants and upwards, it is not unusual to find half a dozen pumping stations from one-half to one mile apart, each with a full complement of boilers, steam pumps and attendants, and the whole operated apparently as much in the interest of the coal dealers and those on the pay-roll as for the taxpayers. A one or two cylinder pump without flywheel, lifting from a single dug well and discharging directly into the mains, is usual.

In a case of this kind recently coming to my notice, I urged the immediate substitution for the steam pumps of an equal number of triplex power pumps operated by constant torque variable speed motors, the current for such motors to come from a central power plant equipped with economical machinery and suitably located.

The annual saving as the result of such a change was estimated to be more than 50 per cent. of total cost of operation. It might be remarked here that the recent appearance of satisfactory constant torque motors, in both A. C. and D. C. types, for operation from constant potential circuits, removes the last difficulty in the most general application of electric power, and now it can be confidently hoped that

* Paper read before the Northwestern Electrical Association, Milwaukee, Wis., January 19-21, 1898.

Average C. P. and Watts per C. P. of Bamboo and Cellulose Lamps During Various Lengths of Burning.

		During a run of—							
		0 hour.	100 hours.	200 hours.	300 hours.	400 hours.	500 hours.	600 hours.	700 hours.
Average C. P.	Cellulose— 110 volts.	16.0	15.89	15.86	15.68	15.41	15.17	14.96	14.74
	Bamboo— 110 volts.	16.0	14.1	12.9	11.8	11.0	10.4	9.9	9.6
	Bamboo— 50 volts.	"	15.8	15.8	15.0	14.6	14.2	14.0	13.7
Average watts per C. P.	Cellulose— 110 volts.	8.16	8.26	8.13	8.37	8.53	8.51	8.54	8.74
	Bamboo— 110 volts.	2.20	3.50	3.80	4.08	4.32	4.58	4.75	4.90
	Bamboo— 50 volts.	3.20	8.28	3.37	8.45	8.53	8.61	8.67	8.76

upon three classes of lamps: 1st, 110-volt cellulose; 2d, the 110-volt untreated bamboo; 3d, the 50-volt treated bamboo. The initial watts per candle power were nearly 3.2 for all. The bamboo represent their class, both the 110-volt and the 50-volt having been carefully selected. The tests upon these were a part of a series upon a large number started in groups of various initial watts per candle, and their results are consistent with those of the entire test. The tests were carefully conducted with the best facilities. They may be considered reliable. Both lamps were at one time extensively used and well regarded.

The figures shown for the cellulose lamps are the combined results of a number of tests made at various times and places and by different persons, but evidently made under similar conditions so far as regulation is concerned. There is excellent agreement, not only in averages but in individual cases, both in candle-power and in watts per candle-power. The oldest tests, which were made over three years ago, show the poorest results. This fact suggests a gradual improvement in the quality of the cellulose lamp. All the lamps entering the tests were samples of commercial lamps taken at random from large lots. No claim is made that the results are remarkable. I believe that they can be relied upon to represent faithfully the present efficiency of the incandescent lamps supplied for central station use.

The remarkable feature is the close agreement between various lots made at different times. This feature is the criterion of quality. Upon it depends the successful introduction and use of the highly efficient lamp. I believe that they can be relied upon to represent faithfully the present efficiency of the incandescent lamps supplied for central station use, because every result was used in the table, whether good, poor or indifferent.

This table shows the mean C.P. during a certain period of service, and not the value found at the

failed before 600 hours, no other conclusion has been drawn from this fact than that the percentage of early failures of lamps, operated under good condition, is so small as to be negligible.

Lamps are to-day more uniform in wattage; a variation in current of 2 per cent. either way from the average, is rare. Candle-power is tested while the lamp is revolving. Thus the true horizontal value is determined. The value of light standards is carefully guarded and constantly checked. The accuracy of all instruments employed in the photometer room is kept at the highest degree. While an official standard of C.P. does not exist, this fact has not caused the great divergence in the light value of different lamps. The most prominent manufacturers are in agreement as to the value of the 16 C.P. lamp. Their standards check more closely than do those of the technical schools. Lamps vary in C.P. because of carelessness and sometimes deception in rating. In the Columbia factory the accuracy of rating is considered a matter of prime importance and constant effort is made to keep the standards exact. Each lamp has a mark whereby its history may be known. The volts at which it gives its normal revolving horizontal C.P. together with the current passing are marked upon a suitable label. A record of these items for each lamp is made at the same time upon a sheet. These sheets are the indices of uniformity in the product.

One of the largest alternating stations in the country has, by substituting the highly efficient cellulose lamp for the low economy silk and bamboo, and by improving its regulation, been able not only to reduce the price of service to its customers, but to increase its lamp capacity over 25 per cent.

There is still one condition to be fulfilled in order that incandescent lighting may be more profitable—the voltage at the lamps must be kept everlastingly and unceasingly steady. There has been improvement, but much more is possible and desirable. Everything about lighting service is improved where regulation is improved, even the customer's temper.

non-expansive steam-working, as in boiler feed pumps, drain pumps, etc., in our lighting and power plants and also in many cases of pumping from wells against a constant head for city and other supply, will soon become a thing of the past.

The demand for water not being constant during the day, a suitable reservoir should always be supplied of such a capacity as not only to allow the engine or engines to operate at constant load but also to supply the extra water for fire purposes whenever it is required. Such a reservoir, though indicated by economy, is often lacking, in whole or in part; and more unfortunate still is the too small size of mains usually employed, the latter necessitating in some cases that the pressure at the pumping stations be more than doubled during a fire to obtain normal or approximately normal pressure at points where fire engines are attached.

These faults, however—the absence of suitable storage capacity and too small pipe—belong to the original design, and have nothing to do with the kind of power used for the pumps. But their absence will of course be seen to greatly facilitate the economical operation of a combined plant, one intended for the utilization of ash-bin refuse, the supply of power for pumping, for disinfecting of sewage and for street lighting.

The usual method of handling sewage is by means of a water carriage system—draining into the nearest stream without disinfecting. But this practice is barbarous. No system of sewage is complete which does not abstract the solid matter and sterilize the liquid portion before turning into our waterways.

The solid matter is readily precipitated as "sludge" in settling pools, and the clear affluent subsequently treated, or not, as the case may be. The sludge can be dried and pressed to about one part by weight of water and one part by weight of solids. This pressed sludge amounts to from one to two cwt. per annum per head of population, according to recent statistics. At first it was thought to have a high fertilizing value, but I believe it is generally recognized now as being useless for such purpose.

It has, however, more than sufficient calorific value to evaporate the water it contains and to destroy itself, and so may profitably be mixed with ash-bin refuse and used for fuel.

Chemical methods of sewage disinfection, when effective, are expensive, and it would seem that electrical methods must supersede them in the future. The two principal methods of manufacturing a disinfecting fluid by electricity are Hermite's and Woolf's, the former being used principally on the Continent and the latter in this country. They do not differ much except in detail. In both systems the disinfectant is obtained by passing a large current of electricity at low pressure through sea or salt water prior to or after being mixed with the sewage. From this results the formation of certain hypochlorites, hypobromites, and iodine compounds, which latter are for the most part in the form of iodates, all strong oxidizing agents directly or indirectly.

Where a common drainage and sewage system is adopted, the disinfecting liquid may be greatly diluted during a storm, but the trouble is obviated by the adoption of separate systems or by the use of a reservoir holding a considerable quantity of the liquid to be discharged into the sewage system in times of heavy rains.

One installation of the Woolf system reported consists of a 15 HP. engine with suitable dynamo, tanks, etc. A bacteriological examination made by competent persons showed almost perfect sterilization. This plant is considered sufficient for disinfecting the sewage of 30,000 population if run continuously.

At usual rates for fuel and attendance, the cost per inhabitant per annum was shown to be about twenty-five cents. A similar cost per inhabitant has been obtained elsewhere.

It will be seen, however, that this figure can be reduced to a small fraction of itself if the system

were operated as a part of a combined plant instead of as a small separate one. As compared with other systems of sewage purification, chemical, land filtration, or a combination of chemical and land systems, the cost per inhabitant per year by the electrical system, even when current is supplied from a special plant, is apparently less by from one-half to two-thirds.

Another important point to note in this connection is, that the electrical system while cheaper and in general more effective requires power at practically a uniform rate, a condition fitting in very perfectly with the economic operation of a pumping plant and the requirements of a plant to burn and utilize town refuse.

The matter of disposal of ash-bin, or more generally town, refuse has not received the attention it deserves. There is but one successful method of handling it, and that is, to burn it; but town refuse has a calorific value equal to about one-fifth that of ordinary coal, and consequently may become, with proper arrangements for its burning, a source of profit instead of an expense.

A difficulty in utilizing the heat energy of town refuse for street lighting is that it requires to be burned at a very regular rate the twenty-four hours. To meet this, the so-called thermal system of energy storage has been devised, but since the power required for pumping, supposing some reservoir capacity in the water system, and for the electrical purification of sewage, is in many cases practically constant, and more than that, obtainable from the refuse, a combination plant would save the expense of such a thermal system and accomplish as much.

It has also been proposed to use such a thermal storage scheme in connection with lighting plants having a poor load factor, but it may be seen that the following scheme is equally effective and involves very small extra cost. Instead of using separate thermal storage tanks, by carefully lagging the entire boiler setting and providing removable insulating covers for the fire and ash-pit doors, the boilers themselves may be converted into heat reservoirs. When one boiler of a battery is to be put out of service, the fire is allowed to burn as low as possible and the boiler well filled with water, then the fire and ash-pit doors are closed and covered, and the main steam valve to header shut tightly, as well as damper in smoke flue. Any further steam generated by the remaining fire on grate and by heat of setting finds its way into the header through a by-pass about main steam valve. In this by-pass is placed a difference of pressure valve to operate whenever the boiler pressure exceeds the pressure in the header by a certain desired amount. The rate of loss of pressure or heat by such an arrangement can be reduced to an extremely small quantity. Now when the boiler is to be put in operation again it has a pressure equal or perhaps greater than that of those in service and brings to their immediate aid its volume of stored energy on a sudden demand for steam. By providing arrangements for starting fires with oil when necessary, the stand-by boilers in a battery can be put into full operation at the rate of perhaps one a minute, or in any case quickly enough to meet such sudden demands for steam as can occur in practice. I have recommended such a method of handling boilers in small city pumping plants, where, during the time steam is not required for pumping for ordinary purposes the fires are banked for quickly getting up steam in the event of a fire. This scheme would save practically all the coal required for banking and which occasionally amounts to nearly one-half of all coal used.

Ash-bin refuse is burned in a special furnace, usually with automatic attachments for uniform feeding. These furnaces, though commonly called destructors, might better, as has been suggested, be called utilizers. In Great Britain there are more than fifty towns in which destructors are at present used. In this country, unfortunately, there are few.

By burning, the refuse is reduced to about one-

third of its weight and one-fourth of its bulk. The residue after combustion consists of clinkers and ashes which are valuable for road-making ballast. In the earlier forms of destructors the temperature was not high, but in more recent ones, designed to be odorless, the temperature of the gases is 1,500 to 2,000 degrees F., and the addition of a suitable boiler to absorb their heat is not difficult. Ordinarily ash-bin refuse will amount to from one to four tons per inhabitant per year. Of course such refuse is a poor fuel, and as it burns with difficulty would seldom be used for steam making. However, it should be burned for sanitary reasons alone and any profit resulting from the utilization of the heat is clear gain.

It is seen then that a destructor plant will combine very perfectly with a plant to supply current for sewage disinfection and for pumping.

For street lighting electricity need only be considered, as the demand for electric illumination, as against other means, is almost universal. But the peculiarity of municipal lighting as compared with ordinary commercial lighting is the constant power required while lights are in use, a feature which again lends itself happily to combination with a pumping plant and plant for sewage disinfection. Also in many cases it will be found that the amount of power required for lighting is not far different from the amount required for pumping. Now from what has been said it will be evident that in many cases a combined plant can be designed to burn and utilize the ash-bin refuse, do the pumping of water from a series of scattered wells, and supply current for street lighting and sewage disinfection, in which all the machinery will be loaded very nearly to full capacity twenty-four hours a day.

The extremely uneconomical machinery used for pumping in many places to-day, and the demand for better sanitation, offer, it seems to me, a very considerable further field for electrical machinery, and one which I trust will not long remain uncultivated.

The pressure of many recent demands must be my apology for this scant treatment of an interesting subject.

Creating an Electrical Town.

The Newark, N. J., *News* of a recent date gives the following particulars of a great enterprise:

"Besides the Weston Electrical Instrument Company, a number of other concerns in the same line of business will, it is said, in the spring locate their factories near Waverly. These others are the Weston General Company, capital \$200,000; the Weston Electric Appliance Company, capital \$750,000, and the European Weston Electric Instrument Company, which manufactures for the European market and is capitalized at \$200,000. The South Newark Land & Improvement Company, with a capital of \$50,000, is also interested.

"This project when completed will form a colony of electrical factories, and the army of workmen employed therein and housed in the immediate neighborhood will ultimately, it is thought, constitute a little town.

"Edward Weston, the electrician, is at the head of the undertaking. The Weston Electric Instrument Company, which has its headquarters at William and Shipman streets, Newark, has grown so rapidly in recent years that its present factory was found to be too restricted for its needs. A plot of ground was purchased some time ago on Frelinghuysen avenue, near Waverly, with the intention of locating new works there.

"An especial inducement was found in the fact that in that immediate neighborhood a water supply of three million gallons a day could be relied upon, a most important consideration in choosing a site for the company's power house.

"The plot has a frontage of from 1,600 to 1,800 feet on Frelinghuysen avenue, and runs west along the old road to the tracks of the Lehigh Valley Railroad. Besides that property, the company also came into

possession of a strip of land running east from the Waverly Hotel to the Pennsylvania Railroad station, besides one or two adjoining tracts. It is here that the electrical industry will construct its various works and its homes for the employees."

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES OF EUROPE.

BY JOHN B. C. KERSHAW, F. I. C. (LONDON).

Chapter XIII.—The Alkali Metals.

In Chapter I of this series (see *ELECTRICITY* August 11, 1897,) reference was made to the fact that "Electro-Chemistry" was a science dating back to the earliest years of the century. We have been so accustomed to regard this new branch of electricity as a growth of modern times that it is very surprising to find that Davy in the years 1806 and 1807 was delivering lectures before crowded audiences at the Royal Institution in London upon "Electro-Chemistry," then really a new branch of science. In the latter year Davy was fortunate enough to separate sodium and potassium in metallic form from their fused hydrates by means of the electric current, and this success raised him at once to a position of great eminence in the ranks of European scientists. The constitution of the alkaline hydrates had long been a puzzle to the chemists of that day, and when Davy on November 19, 1807, informed the audience gathered to hear him deliver the annual Bakerian lecture before the Royal Society that he had solved the problem by means of electricity, and that he had separated from these bases two metals of extraordinary properties, to which he proposed to give the names potassium and sodium, the astonishment and excitement in scientific circles was indeed great. The description by Davy of the results obtained when electrolyzing caustic potash is sufficiently interesting to be given in his own words: "A small piece of pure potash which had been exposed for a few seconds to the atmosphere, so as to give conducting power to the surface, was placed upon an insulated disk of platina. connected with the negative side of the battery of the power of 250 plates in a state of intense activity, and a platina wire communicating with the positive side was brought in contact with the upper surface of the alkali. . . . Under these circumstances a vivid action was soon observed to take place. The potash began to fuse at both its points of electrization. There was a violent effervescence at the upper surface; at the lower or negative surface there was no liberation of elastic fluid, but small globules having a high metallic lustre, being precisely similar in visible characters to quicksilver, appeared, some of which burnt with explosion and bright flame as soon as they were formed and others remained and were merely tarnished, and finally covered by a white film which formed on their surfaces."

Thorpe in his remarks upon this epoch in Davy's life says: "Sometime during the first fortnight in October, 1807, he obtained his first decisive result; and on the 19th November he delivered what is generally regarded as the most memorable of all his Bakerian lectures. Few discoveries of like magnitude have been made and perfected in so short a time, and few memoirs have been more momentous in result than that which Davy put together in a few hours, and in which he announced his results to the world. The whole work was done under conditions of great mental excitement. His cousin, Edmund Davy, who at the time acted as his assistant, relates that when he saw the minute globules of the quicksilver-like metal burst through the crust of potash and take fire his joy knew no bounds; he actually danced about the room in ecstasy, and it was some time before he was sufficiently composed to continue his experiments."*

Davy had used in fact a method of preparing these metals that to-day is being employed for their production upon an industrial scale; but it has taken nearly a century for the process to pass from the experimental to the industrial stage of its development. The cause of this long delay has been that often alluded to in these chapters on the development of the electro-chemical industries; namely, the absence of a cheap and reliable source of electrical energy in large quantities. Until the year 1892 all the potassium and sodium produced for scientific or commercial purposes were made by the chemical method of manufacture; and even the large quantities of sodium required in the aluminum process worked at Oldbury, near Birmingham, between the years 1888-1891 were obtained by the old reduction method. But the success of the electro-chemical and electro-metallurgical methods in the copper and aluminum industries had led chemists to turn their attention to the application of electricity in other branches of the chemical manufacture, and in 1893 the method used by Davy, nearly ninety years before, was put into operation upon a fairly large scale at the works of the Aluminium Company at Oldbury, Birmingham. In the years 1894-95 there were three works in England where sodium was produced by electrolysis of the hydrate or chloride, while potassium was produced by a similar process at Patricroft, near Manchester. The Aluminium Company of Oldbury are however now sole producers of sodium in England, while abroad the manufacture is carried on by the "Elektro-chemische Werke," Bitterfeld, and by the Elektro-chemische Werke, Berlin.

The following is a description of the apparatus and process as worked by the Aluminium Company, who still remain the largest producers of the alkali metals in Europe. The apparatus is protected by Patent No. 13,356, granted to Castner in 1890. An iron vessel contains the fused hydrate, which is maintained at a temperature about 20° C. above its melting point by means of gas-jets, or by means of the heat generated by the electric current. The regulation of the temperature requires considerable attention; if allowed to become too high, portion of the metal separated by the current at the cathode will become oxidized, and pass by diffusion into the electrolyte again as caustic hydrate, while if too low the fused hydrate will not remain in the fluid state, and will cease to act as an electrolyte. The cathode is of iron and projects up into the fused hydrate through the bottom of the vessel, into which it is cemented by a cooled mass of the same hydrate. The anode, which may be of carbon or of metal, is connected to the under side of the lid of the vessel, and encircles the upper part of the cathode. A small wire gauze cage is used to collect the metal which rises to the surface of the fused hydrate, and a continuation of this cage hangs as a circular curtain between anode and cathode, and acts as a diaphragm. The metal that gathers in the collecting cage is removed at short intervals (every twenty minutes) by means of a perforated ladle, and fresh caustic hydrate is added to maintain the electrolyte at a constant level. One thousand HP. is stated to be used at the Oldbury Works in operating Castner's process, and an output of one ton of sodium per day is stated to be obtained. The process is practically a continuous one. The theoretical EMF. necessary to decompose fused sodium hydrate is 4.21 volts, but the experiments made at Oldbury have shown that the decomposition can be effected with a lower EMF. than this. The discrepancy is probably due in part to the high temperature used at Oldbury. Taking the electro-chemical equivalent of sodium as .000238691 grm. and the theoretical EMF. required to decompose sodium hydrate as 4.21 volts, we find that 1,000 IHP. should produce

$$\frac{.000238691 \times 60 \times 60 \times 24 \times 1000 \times 735 \times 85}{100 \times 4.2 \times 1000 \times 1000} = 3.067$$

tons sodium per day of 24 hours. As the actual production is stated to be one ton per day, it follows

that the energy efficiency of the process as worked at

$$\frac{1000}{3067} = 32 \text{ per cent.}$$

Taking the cost of EHP. hour as .282 cent,* the cost of the power requisite to produce one ton sodium by the Castner process is found to be

$$\frac{.282 \times 1000 \times 24 \times 85}{100 \times 100} = \$57.52.$$

Since this one ton of sodium is worth at present about \$960, it is evident that the manufacture must be a profitable one. Borchers gives the following detailed estimate of the cost of 100 kgs. sodium (100 kgs. = 220.4 lbs. = $\frac{1}{10}$ metric ton) in the apparatus designed by himself for the production of the metal from the fused chloride: †

850 kgs. salt.....	\$1.68
8 tons coal for steam raising.....	7.20
1 ton coal for heating the apparatus.....	2.40
2 firemen.....	2.40
2 engineers.....	8.60
6 laborers.....	5.76
Renewing the decomposing apparatus.....	24.00
Interest and depreciation.....	8.16
	<hr/> \$55.20

The cost of the energy in this estimate is seen to be much higher than that given by the writer as the probable cost in the Castner process; but Borchers has based his calculation upon the very high current density of 467 amperes per square foot and an EMF. of 10 volts.

The market for potassium and sodium is a very limited one, and when these metals are produced by the ton it is easy for the supply to be much in excess of the demand. Much of the sodium produced at Birmingham is used by the firm themselves for the manufacture of sodium peroxide, and of cyanide for use in the cyanide gold extraction process. The latter is made by heating potassium ferro-cyanide with potassium or sodium, the product obtained by this reaction being much purer than that obtained by the usual method of cyanide manufacture.

The sales of the Aluminium Company have recently fallen off, owing to competition from Germany, but in the last report the directors state that they are taking legal proceedings for infringement of their patents against some of the competing firms.

The electrolytic method for the production of sodium and potassium described in this chapter is to be worked in America by the Electro Chemical Company of New York, who are now building works at Niagara.

Although the manufacture can never become a large one, it is one of the most interesting of the new electro-chemical industries. It illustrates well the advantages that result when electricity replaces the pyro-chemical methods of the earlier day. In this particular case, cleanliness and safety have been gained by the change.

Draw Your Dividends.

The local stockholders of the Sterling Remedy Company, makers of Cascarets and No-To-Bar, will be pleased to learn that the great "Union for Profit" has again declared its regular semi-annual dividend of 3 per cent. and the checks are now being mailed. The annual report of the Board of Directors shows that over 3,000,000 boxes of Cascarets were sold during the year 1897, and that the prospects for 1898 are indicating a doubling of the business. The great success of this great corporation was developed within two years, principally on the merit of its preparations, effective general newspaper advertising and the co-operative push of its thousands of interested and enthusiastic stockholders all over the country. It is at once an illustration of the quickness of the American people to recognize something that's good of the force of newspaper advertising, and of invincible power of co-operation.

* Estimate by present writer in *Electrician* (London), Dec. 25, 1896.

LONDON NOTES.

[From our London Correspondent.]

Institution of Electrical Engineers—President's Address.

Mr. J. Wilson Swan, F. R. S., the new President of the Institution of Electrical Engineers, delivered his opening address on January 13th to the members of that Institution. Mr. Swan made a brief reference to the method of illumination by incandescent electric lamps which he introduced to the notice of this Institution sixteen years ago. He proceeded to make special reference to the subject of electro-chemistry and the electro-chemical industries, which, he said, were of great interest and importance, and young engineers would do well to study the field within which lay the application of electricity to chemical processes. The field was a very large one, and only a small part of it was occupied. Regarding the industrial applications of electricity, one-third of the fine copper produced in the world was obtained electrically, and the present price of aluminum, which in 1855 was nearly as dear as silver, silver itself being twice its present price, was entirely due to the development of the electrolytic method of production. He considered that the most important of all the applications of electrolysis now engaging the attention of electrical engineers was the manufacture of alkali, several electrolytical processes being now in operation for the production of caustic alkali and chlorine. Electrical methods were also in use for making sodium, chlorate of potash, carbondum, calcium carbide, and ozone, from which secondary effects of great value could be obtained. Mr. Swan touched on many other subjects, such as water power utilization and the direct conversion of heat energy into electrical, which he said was not yet within sight.

Electric Tramway Schemes.

The electric tramway schemes on foot in England are very numerous, and there are many important electric light railways waiting for the permission of the Light Railway Commissioners. An eight mile electric tramway is to be constructed from the boundary of Oldham, through Ashton-under-Lyne, Audenshaw and Denton to Hyde. These various districts have a population of somewhere about 250,000 people, and it is considered that the line has every prospect of financial success. The electrical energy for working the tramway will be supplied by the municipality of Ashton, upon certain terms per unit which have been arranged. The permanent way is now being laid, and the electrical equipment is in hand. The English investing public has just had the scheme laid before it in the form of a prospectus inviting applications for over \$400,000 in shares.

Electric Power Schemes.

Two important undertakings are projected in the way of electric power distribution. Two companies have been formed, known as the Midland Electric Corporation for Power Distribution, and the General Power Distribution Company, for the purpose of supplying electrical energy within certain areas for the convenience of manufacturers and others who are anxious to use the electric power for machinery driving, but cannot afford or do not care to put down special installations for themselves. One of the companies takes into its area a large number of very important manufacturing centers and offers very favorable terms to manufacturers in South Staffordshire. Current would be supplied at 1d. per Board of Trade unit for power, and 6d. per unit for lighting for one hour and 3d. per unit afterwards. The company would lay a comprehensive system of mains and supply motors for hire, to save outlay on the manufacturer's part. Both the schemes are meeting with considerable opposition from the municipal authorities of the districts they propose to supply. Some of them already have municipal

electric lighting plants and are afraid of competition. This is a cause of most of the opposition.

Practical Work with X-Rays.

A paper with this title was read before the newly formed Roentgen Society in London on January 11, by Mr. W. Webster, F. C. S. After describing the best forms of apparatus to use, and the various methods for avoiding failures, he stated that the best coils were of English manufacture. Reference was made to the early work of Sir William Crookes and Prof. Jackson. A tube made by Prof. Jackson in 1894 was shown, with which he had demonstrated that wood and other materials were pervious to certain rays. The speaker had found an improvement to prevent the spark from passing round the bowl of the tube and thus lessening the danger of perforation. By heating the tube and starting with a small spark he was able gradually to produce the effect he wished, and thereby had saved the lives of many tubes. The bulb of the tube should not be very large, as the larger it was the more difficult the tube was to condition and the greater were the number of accidents. An aluminum cover for the cathode tube was an advantage, and a protector of sheet iron was useful for saving the hands from the effect of the rays. Anæmic subjects were the best to photograph, while gouty subjects were particularly difficult. To produce good negatives considerable experience in photographic development was necessary, especially in the production of cloud negatives.

IMPORTANT "ELECTRICAL EXHIBITION" ARRANGEMENTS.

Aside from the fact that large amounts of space are now being taken up for the Electrical Exhibition in Madison Garden next May, and that the flow of applications is such as to exhaust every possible and available square foot, a great deal of other preliminary work is going on quietly. A very important and interesting piece of news is the acceptance by Prof. F. B. Crocker of the position of Consulting Engineer, on invitation of the management, which is desirous of associating with itself all that is best in regard to the technical side of the art. Prof. Crocker, who regards the Exhibition as a highly useful means of reaching the public, is deeply interested in its success and wishful of promoting its beneficial influence in every way. His name as Consulting Engineer is a guarantee of good work being done under his supervision by the construction staff in the disposition and safe-guarding of the exhibits. Prof. Crocker as President of the American Institute of Electrical Engineers and Professor of Electrical Engineering at Columbia University represents the highest technical skill known in the profession, and the Exhibition management felicitates itself upon the valuable acquisition.

In addition to this, an Auxiliary and Educational Committee has been formed to take general charge of Exhibition matters other than commercial, and to co-operate with the Advisory Committee which represents the New York Electrical Society. The Auxiliary Committee comprises men of the highest standing, all of whom intend to take an active part in the work and are now making extensive and interesting plans, of which news will be published from time to time. Mr. T. C. Martin, who was chairman of the very successful committee of the 1896 show, has again consented to serve in the same capacity. With him are associated Prof. F. B. Crocker of Columbia University, Prof. Morris Loch of the University of New York, Prof. W. E. Geyer of the Stevens Institute of Technology, Dr. Chas. A. Doremus of the College of the City of New York, Mr. Herbert Laws Webb of the New York Telephone Company, Mr. J. B. Taltavall, editor of the *Telegraph Age*, Dr. Park Benjamin, Secretary G. H. Guy of the New York Electrical Society, Mr. W. T. Wheeler, Vice-President and National Deputy National Association of Stationary Engineers, Lieut.

G. O. Squier, U. S. A., and Mr. Thos. A. Edison, Jr. (who is in charge of some special decorative and mechanical effects). It is believed that this committee, enjoying as it undoubtedly will the heartiest confidence and co-operation of all, will be able to accomplish some extremely useful and memorable work in behalf of the science and industry.

As already announced, the New York Electrical Society is the body under whose auspices the Exhibition is to be held, and it has appointed an Advisory Committee entrusted with its interests and composed of its present officers and past presidents, namely: Present officers—Dr. M. I. Pupin, President, and Messrs. Dunn, Sinclair, Case, Osterberg, Guy, Riker, Cobo and Ker; past Presidents—Messrs. F. W. Jones, Small, Pendleton, Crocker, Wetzler, Mailloux, J. W. Lieb, Jr., and Dr. C. E. Emery.

A SPECIAL PRIZE OFFER.

Theses Competition for Students.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to *ELECTRICITY*.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For *Electricity's* Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of *ELECTRICITY*, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and wherever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of *ELECTRICITY* duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all theses submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of *ELECTRICITY*, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we should like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not thoroughly clear, we will be pleased to answer any inquiries relating to this matter.

BOOK REVIEWS.

THE MOTOR ENGINEER'S AND ELECTRICAL WORKER'S HAND-BOOK. By WILLIAM LINTERN, West Park, O. 150 p. Price, \$1.50.

This little work, which is in pocket size, was compiled, as the title indicates, with a view to furnishing a book of reference in convenient form for the use of motor engineers and street railway men. The opening pages are devoted to a general explanation of the rudiments of electricity, such as the various units used, Ohm's law, etc., and to showing how simple problems that are constantly arising in practice may be readily solved. Further directions and instructions are given as to how various electrical apparatus should be handled to obtain the best results. The little book is essentially practical in its bearing and should prove of great value to electrical workers in general. The diagrams and tables will prove especially useful.

ANDERSON'S PHYSICAL EDUCATION. By WILLIAM GILBERT ANDERSON, M. D. Published by A. D. Dana, 853 Broadway, New York. Price 25 cents, sent postpaid.

We have just received from the publisher a copy of this useful little book. It is the latest work of Dr. W. G. Anderson, the well-known Professor of Gymnastics at Yale University. The book treats of every phase of body building and is "up to date" in every particular. There are special chapters devoted to professional people, business men, women and children. It tells you how to decrease your weight if corpulent and increase it if thin. It gives valuable measurement charts for both men and women. Every reader interested in better health, greater strength, grace, self-control, elegant carriage, should possess a copy of this work.

The book is full of good suggestions for all classes. The parent who is anxious about the narrow chest of the child—the young man who is worried about his lungs and stooping shoulders—the business man on the verge of collapse—the busy editor, lawyer or minister alarmed because of an overtaxed brain and its resultant sleeplessness—the society woman, the housewife, the young lady, can all find in this book much that will benefit and help them. We know of no work that gives so many useful and helpful suggestions in such compact and readable form. The illustrations, about one hundred in number, are taken from drawings and life.

SOCIETY NEWS.

American Institute of Electrical Engineers.

The 121st meeting of the Institute, which was held at 12 West Thirty-first street, New York, on the 26th ult., was devoted to a discussion on Standardizing Generators, Motors and Transformers. The discussion was opened by Mr. E. W. Rice, Jr., and was participated in by Messrs. Lozier, Kennelly, Wolcott, Hutchinson, Lieb, Dunn, Coho, Pattison, Henshaw, Steinmetz, Mailloux, Osterberg and Mossorop. The appointment of a committee to consider the question was suggested, and subsequently the whole matter was referred to the Institute council for such action as it may deem proper.

At the meeting of the council in the afternoon the following associate members were elected:

Chas. R. Bangs, Special Agent American Telephone and Telegraph Co., New York.

M. C. Beebe, Assistant in Electrical Engineering, University of Wisconsin, Madison, Wis.

Hugh Thomas Brown, Supt. of Electrical Department Selma Gas and Electric Co., Selma, Ala.

Edward P. Buroh, Electrical Engineer Twin City Rapid Transit Co., Minneapolis, Minn.

Eben Clinch Crocker, Electrical Engineer American Ordnance Co., Bridgeport, Conn.

Albert B. Elias, Electrician Davis Coal and Coke Co., Thomas, West Va.

Alex. Stanley Garfield, Engineer Cie. Thomson, Houston, Paris, France.

Chauncey Graham Hellick, Electrical Engineer Chicago Telephone Co., Chicago, Ill.

Jacque L. Morgan, Electrical Inspector Kansas City Fire Department, Kansas City, Mo.

Herman A. Prosser, Electrician Baltimore Copper Smelting and Refining Co., Baltimore, Md.

John Joseph Swann, Assistant Editor *Engineering News*, New York.

C. Walton Swoope, Instructor in Electrical Engineering Spring Garden Institute, Philadelphia, Pa.

Jin Tachihara, General Electric Co., Schenectady, N. Y.

Henry Electrical Society.

The 96th meeting of the Henry Electrical Society will be held at Columbia University, Engineering Building, Room 302, on Friday, February 4, at 8:15 P.M., when A. H. Ford, E. E., will deliver an experimental lecture on "Transformers."

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

LEGAL NOTES.

The Supreme Court of this State has decided that the appeal of the New York, New Haven & Hartford Railroad Company from the decision of Judge Wheeler of the Superior Court in the matter of the building of the Shelton Electric Railway cannot be allowed.

John E. Ridall filed a bill in equity at Pittsburg, Pa., against the Brush Electric Company, to compel the defendant company to file a bill of discovery and make an accounting to the plaintiff for goods sold in territory allotted to Ridall as agent for the company. In 1880, Ridall and Eugene Ingold, partners as Ridall & Ingold, made a contract with the Telegraph Supply Company, of Cleveland, by which they were given the exclusive agency for Western Pennsylvania and parts of Ohio and West Virginia. The agents were to receive a commission of 20 per cent. on all goods sold in this territory. The Telegraph Supply Company changed its corporate name and the partnership of Ridall & Ingold was dissolved. The interest of Ingold in the contract was assigned to Ridall February 9, 1894, and the assignment was approved by the Brush Electric Company. The plaintiff claims that beginning in 1889 the Brush Electric Company has sold and permitted to be sold through other agents goods covered by the agreement for an aggregate price of not less than \$300,000, upon which the plaintiff claims a commission of \$60,000. A suit has been entered to recover this amount, and the bill in equity is to compel the defendant company to produce certain records necessary in the trial of the case.

An attachment from Steuben County, N. Y., against the Bernstein Electric Company of Boston for \$1,459 in favor of the Corning Glass Works is in the hands of the sheriff. Dispatches from Boston, however, state that the Bernstein Electric Company has made an assignment. It was incorporated in 1888 with a capital stock of \$100,000, and the plant was mortgaged in 1889 for \$100,000. The company manufactured electric lamps and appliances.

At Ottawa, Ill., Ex-Mayor L. W. Hess has been appointed receiver of the Ottawa Electric Street Car Company, of which W. F. Ellis of Boston is president. The company was organized last year with a capital stock of \$100,000. Extensions and a resort were built at large expense, which Eastern capitalists who hold stock agreed to but have failed to pay for. The line will be operated by Receiver Hess under order of the court.

Judge Bishop at Des Moines, Ia., has rendered a decision in the case Windsor vs. the city, the Board of Public Works, the McCaskey-Holcomb Company et al. He granted the injunction asked for to restrain

the city from building the plant under the contract made last August between the city and the McCaskey-Holcomb Company. The Judge decided that the election held last May, to get the views of the voters on the city plant proposition, was rendered invalid by the fact that the two proposals submitted to the voters were contradictory.

GENERAL NEWS.

What Is Going On in the Electrical World.

Albany, N. Y.—Assemblyman Guider has introduced a bill providing that all telegraph, telephone and electric light poles and wires in cities of 50,000 inhabitants shall be removed within one year. Poles now in use in connection with underground systems are not affected by this act.

Anderson, Ind.—Articles of incorporation have been filed by W. M. Leeds, D. G. Reed, L. H. Landon and others, whose purpose is the construction of an electric railway from Elwood to Anderson and subsequently to Lapel. As Congressman C. L. Henry and Philip Matter have already secured right of way for an electric road between the two cities, the incorporation of the new company is supposed to be a move in the interest of the Panhandle Railway Company, whose line the Henry road parallels. The Henry company, however, announces that it will go ahead with the construction of its road.

Athens, Ga.—The cotton mills in this section of Georgia are rapidly adopting electricity for motive power. Two cotton mills in Clarke county have just finished putting in a full electrical equipment.

Boston, Mass.—It is understood that Tucker, Anthony & Co. of this city will finance a new electric road to be known as the Providence & Taunton Street Railway, to operate between the two cities, connecting with the Union Railway Company of Providence and the Brockton, Bridgewater & Taunton Street Railway Company at Taunton. The proposed capitalization is \$175,000 stock and \$175,000 bonds. Construction will commence in the spring. The road will be 14 miles in length and will make a direct road between Providence and Taunton. The distance between the cities by steam road is 24 miles and the fare is 60 cents, while the new company proposes to run cars between the two cities in one hour and 15 minutes and charge 25 cents.

Brooklyn, N. Y.—The laying of the trolley car tracks on the Bridge has been completed, including the loops at the New York end, and cars of two or three companies are making regular trips over the Bridge daily. The trip is made in 6 minutes.—President Rossiter of the Heights Railroad Company has sent to Sheriff Creamer a check for \$10,105.04 to settle the judgment obtained by Charles J. Patterson in favor of Robert H. Furman, who was injured by one of the company's cars in 1895.

Chicago.—The city council has passed an ordinance granting the Wisconsin, Inland Lakes & Chicago Railway Company the right to lay tracks for a period of fifty years, along, under and upon certain streets of the city. The company is given two years in which to lay its tracks and have its lines in operation and agrees to pay the city \$550,000 for the privilege. The company is capitalized for \$10,000,000 and is said to contemplate an underground roadbed for portions of its line. A. E. Case is the Chicago representative of the company.

Cincinnati.—The Walnut Hills cable line is being changed into an electric system, and by the middle of the month the hum of the trolley will have totally displaced the dull buzz of the cable.—The Norwood council having refused to grant the concession asked for by the Bullock Electric Company for the removal of their manufacturing plant to that village, it is now doubtful whether the company will establish its works at Norwood. One of the proprietors states that the company has received flattering offers from Covington, Ky., Chester, Penn., two or three places in New Jersey and several places in New York, but prefers to remain in Cincinnati or near by if possible. The Manufacturing Club of Cincinnati has taken up the matter and will try to secure a site for the company in this city.

Corsicana, Tex.—The city council has granted a franchise to M. M. Bright and E. L. Tyndale of Chicago to construct and operate an electric street car line over all the streets of Corsicana for a period of twenty-five years. The line will be operated with the Patton motor.

Cullman, Ala.—The city council has granted a franchise to J. E. Clark of this city and Charles Temple of Grand Rapids, Mich., for waterworks and electric lights. Fifteen years is the term of the franchise.

Delaware, O.—Hon. J. D. Van Deman has been removed as receiver of the Delaware Electric Railway on application of Miss Ava Main, one of the stockholders, who objected to him as being favorable to the bondholders. Captain John A. Cone has been appointed receiver in his place.

Dickson, Tenn.—Capt. John Adams, who is erecting a cob-pipe factory here, proposes to add an electric light plant to the factory and supply light for the town.

Goshen, Mass.—Interest in the proposed electric railway from Williamsburg to Goshen and Cummington was revived among the people here by the recent visit of John C. Hammond of Northampton, who is a most enthusiastic promoter of the scheme. It is now believed that sufficient stock will be subscribed to warrant the

construction of the road early in the spring. The road will be equipped for freight as well as passengers.

Grass Lake, Mich.—The question of putting in an electric lighting plant here will be voted on at the spring election.

Hagerstown, Md.—The Washington County Electric Power Company has been organized by Messrs. Lynch, Jennings and Herman of Harrisburg, the present owners of the Hagerstown Street Railway, and several Hagerstown capitalists. The plant will supply both power and light, and it is thought will absorb the Hagerstown electric light plant, which at present is owned by a Philadelphia syndicate.

Knoxville, Tenn.—It is authoritatively stated that a deal has been consummated between the Knoxville Street Railway Company and the Citizens' Railway Company, controlling the rival railway and light systems. The Knoxville Company, of which J. Simpson Africa of Philadelphia is trustee, will be reorganized and the issues of the two companies pooled. W. G. McAdoo of New York is president and W. W. Harrison of Philadelphia, a large owner of the Citizens' company, vice president. The two companies have had a long stage of litigation.

Lancaster, O.—The county commissioners of Licking County have granted a 25 year franchise to the Columbus & Buckeye Lake Electric Railway Company for the construction and maintenance of a single track electric railroad from Hebron to Newark along the east or canal side of the Newark and Hebron road.

Lexington, Va.—John R. Williams of Richmond and A. Royall of Manchester, Va., are organizing a company and have petitioned the Legislature for a charter for a street railway in this city. The line will be about three miles long.

Lima, N. Y.—There is at present a scheme on foot in this place by means of which the town may, in the near future, be lighted by electricity and the defunct Lima & Honeoye Falls Railroad converted into a trolley road. There are certain Eastern capitalists interested in it, and if they receive anything like moderate encouragement they will erect a power house midway between this place and Honeoye Falls and light Honeoye Falls as well as Lima.

Lonaconing, Md.—John M. Burchinal of Moundville, W. Va., and A. Flick of Altoona, Pa., have engaged an agent to secure for them right of way for an electric railway to be built from Cumberland to Piedmont and Westernport, via Mount Savage, Frostburg, Lonaconing and others town in the Maryland coal region.

Lykens, Pa.—An ordinance granting the Lykens & Williams Valley Electric Railway Company permission to construct its railway over Market street in the borough, and to operate by electricity according to the single trolley system, has been passed by the council.

Lynchburg, Va.—The franchise and plant of the Lynchburg Electric Company will be offered for sale on the 8th of February by the commissioners appointed by the court. The franchise of the company continues in force for thirty years from the 1st of January, 1881. The length of its railway in operation is between five and six miles. The sale is subject to ratification by the court, and will be made to the highest and best bidder, who will be required by the commissioners, before making any adjudication to him, to pay in cash the sum of \$5,000 on the day of sale, and if the sale is confirmed by the court, the balance of the purchase money must be paid within twenty days from that day.

Neola, Ia.—An election is to be held February 14 to decide whether a municipal electric light plant shall be established.

Newark, N. J.—Bernard M. Shanley, recently elected general manager of the Newark & South Orange Railway Company, has been making full inspection of the plant with a view to remedying defects and improving the line.

New York.—The Ninth Avenue line of the Metropolitan Street Railway Company, an underground electric system, has been completed and is now in operation. Early in March all the lines operated by the company north of Fifty ninth street are expected to be run by electricity or cable. The Metropolitan Company has given out contracts for 300 open cars for summer service, and 300 closed cars are now being built for the company by the Stephenson Car Company and a Philadelphia Company.

Ottawa, Ill.—The Ottawa Street Railway Company has been placed in the hands of a receiver, L. W. Hess. The cars will continue to run under the orders of the court.

Paris, Tex.—Judge D. H. Scott has been making inquiries at Fort Worth in regard to the cost and operation of electric roads, with the view, it is said, of building one in Paris.

Pittsfield, Mass.—The annual meeting of the Stanley Electric Manufacturing Company was held on the 25th ult. These officers were elected: President, W. W. Gamwell; treasurer, G. W. Bailey; manager, Henry Hine. The old board of directors was re-elected. A 6 per cent. annual dividend was declared, payable April 1. The company did \$600,000 worth of business the past year, with a gross profit of \$100,000, and has orders on hand for \$175,000 worth of machines.

Portland, Me.—The Maxham Electric Third Rail Company has been organized here for the purpose of dealing in patent rights and manufacturing all appliances of which this company may become possessed, with \$100,000 capital stock, of which \$50 is paid in. The officers are: President, G. S. Merrill of Lawrence; treasurer, E. L. Pillsbury of Boston.

Reading, Pa.—Work on the Boyertown & Reading Electric Railway is to begin immediately. The line will be about twenty miles in length and pass through a number of villages.

Richmond, Va.—A bill has been offered in the Senate by Mr. Wickham to incorporate the American Development Company, with Tazewell Ellett, Warren P. Taylor, O. F. Bresee, Jr., H. G. Buchanan, Charles V. Carrington, Wirt E. Taylor, Clyde W. Saunders, A. L. Ellett, Jr., and C. H. Fleming, all of Richmond, as incorporators. The act authorizes the company to purchase, own, sell, rent, buy, lease, etc., any real, personal, or mixed property in South America, and more especially to buy, lease, sell, rent, operate and generally to own and develop any concession, grant or franchise for street railways, bonded warehouses, cattle-packing, cold storing and shipping, railroads, telegraph and telephone lines, and to establish, operate, own, perpetuate and generally to work or cause to be worked or operated mines, mills, factories, electric plants, etc., in the republic of Venezuela. In the State of Virginia and in Venezuela the company shall have power to do a general banking business. The capital stock is to be not less than \$1,000,000, and may be increased to \$25,000,000. It is said the incorporators have ample financial backing.

Schoolcraft, Mich.—At the election held on the 25th ult., this village voted in favor of establishing water-works and electric light plant.

Silver City, Idaho.—A movement is on foot to establish an electric light plant in this place. John Tardiff, an electrician and engineer, is working the matter up.

Somerville, N. J.—The war that has been waged by the Brunswick Traction Company against the Philadelphia Traction Company for the right of way through the towns of Somerville and Raritan has resulted in a victory for the New York & Philadelphia Traction Company, which has been granted a franchise by the Somerville town commissioners to build its road through the town.

Stanton, Mich.—An electric railway from Grand Rapids to Belding, Stanton, Crystal, Ithaca and Saginaw is being strongly urged.

Sycamore, O.—The citizens have voted to bond the town in \$20,000 to build an electric light and water-works plant.

Tipton, O.—A company has been organized for the purpose of constructing five miles of electric railway to connect with Atlanta on the southern edge of the county.

Topeka, Kan.—The Brush electric light plant of Topeka has been sold under foreclosure proceedings to the Edison Electric Light & Power Company for \$5,500. This places the Edison people in complete control of the commercial electric lighting business in Topeka.

Trenton, Mo.—The Trenton Gas & Electric Light Company has been reorganized and the following officers chosen: President, Henry Wettstein; vice-president, B. C. Nichols; treasurer, R. M. Cook; secretary, T. F. Fulkerson.

Trenton, N. J.—Assemblyman Carroll has introduced in the House a bill which provides that all insulators for electric light and trolley wires shall be red in color to give better protection to employees.

Ventura, Cal.—The Ventura Land & Power Company's incandescent light and ice plants were burned on the 20th ult., enailing a total loss. The plants were fully insured.

Vincennes, Ind.—Petitions are being signed by property owners along the line, granting the right-of-way for an electric railway from East St. Louis, Ill., to this city. The Wabash & Mississippi Construction Company has the matter in hand, and will begin work as soon as the right-of-way has been secured.

Waterbury, Conn.—The Waterbury Electrical Association has been organized with the following as its officers: President, W. T. Oviatt; vice-president, J. E. Kilbourne; secretary-treasurer, George M. Chapman; recording secretary, M. Greaney.

Weston, O.—This town voted at the recent election on the question of getting an electric light plant, the result being—175 votes for, 54 against. There was great rejoicing when the vote was announced.

Wilmington, Del.—The Jackson & Sharpe Company is shipping a number of electric cars to South America for use on the tramways in Buenos Ayres. The cars are thirty feet long and similar in make to those used in this country during summer months.

NOTES FROM A CORRESPONDENT.

Albany, N. Y.—At the recent Annual Convention of the State Medical Society in this city interesting papers were read by Drs. Arthur L. Fisk, of New York, and Francis H. Williams, of Boston, in regard to results obtained from the X ray in the practice of medicine and surgery. Dr. William Haines, Jr., of Albany, gave an interesting illustrated talk about "The X-Ray—Clinical Experiences." Three X-ray machines were in operation, and their usefulness was explained by Dr. Samuel Lloyd, of New York. During the illustrations a large sheet of canvas was hung across the west end of the Common Council Chamber upon which were thrown photographic illustrations of fractured bones and the interior of the human body.

Rensselaer, N. Y.—It is stated that the material for the new plant of the Kinderhook Light & Power Company will be delivered in Rensselaer in a few days.

Arrangements have been made for setting poles and stringing wires. This work will be completed within two weeks.—At a meeting of the committee from the board of directors of the Greenbush & Nassau Railway with the contractors for building the road it was decided that the contractors, J. M. Sullivan & Co., should be notified to settle all claims and debts incurred in the building of the road on or before the 31st of January or to forfeit the contract and give back the bonds which had been given in part payment. It is stated that other contractors are ready to proceed with the work if the present contractors will give it up.

Franklin, N. Y.—The Delaware Terminal Railroad has obtained its charter and issued bonds. This road runs an electric line from Franklin to Sidney. Grading has been in operation for two months and the work is well advanced. It is expected that the road will be completed by April or May.

PERSONAL AND MISCELLANEA.

It is positively stated that more than 2,000 patents for car fenders have been issued by the Patent Office, and it is still doubtful whether a single life has been saved by their use.

The London Institution of Electrical Engineers comprises 2,762 members, made up of one honorary member, 176 foreign members, 619 members, 1,729 associates and 237 students.

The executive committee of the Milwaukee board of fire underwriters has decided to recommend the election of Edward M. Dexter as electrical inspector for that city. The position has remained vacant since the resignation of George McLaren, who left on November 1 last for Mexico as the representative of an electrical concern. Mr. Dexter was connected for several years with the Wisconsin Telephone Company.

Edward M. West in a letter to the Buffalo "Times" gives a description of Rudolph M. Hunter of Philadelphia, who was recently granted patents that have created some stir in the electrical business and may be the cause of extensive infringement suits: "Mr. Hunter," writes Mr. West, "is a man of interesting personality; he seems to take no credit to himself for the work he has done. He cares apparently nothing whether it is accredited or not so long as it is not interrupted. His tastes are inherited from a talented parentage. At the age of thirteen he invented an electrical contrivance for propelling canal boats. Since then he has unraveled many of nature's secrets one after another and made them subservient to the needs of man. If his activity continues and his success is as striking in the future as it has been in the past he will live to achieve fame in spite of his modesty and will bring to the use of art the best that science can afford."

A dispatch from Colorado Springs, Col., dated January 25, announces the death in that city by consumption of Oliver Blackburn Shallenberger, consulting engineer of the Westinghouse Electrical & Manufacturing Company. Mr. Shallenberger was considered one of the greatest electricians in this country. He was born at Rochester, Beaver County, Pa., in 1860, educated at the U. S. Naval Academy at Annapolis, and graduated third in a cadet engineer class of thirty. He resigned from the navy in 1883 to devote his entire attention to electrical study. He joined the Westinghouse Company and had full charge. He was the inventor of many leading devices which have won fame for the Westinghouse Company. Among them is the Shallenberger meter for measuring power and light, in use all over the world. During the last year he had perfected a meter which was still more accurate. He furnished all the data and working plans for the ponderous machinery which the Westinghouse Company built for the Niagara Power Company and others, and inaugurated a gigantic electric plant in Colorado Springs to furnish power to the mining field of Cripple Creek. He was in charge of the experiment laboratory of the Westinghouse Company at Rochester, and his residence in that town is one of the finest in Western Pennsylvania. He is survived by his wife, a son and a daughter.

A Madison, Wis., paper states that until he was forty-three years old Emerson McMillin, who is said to have engineered the recent gigantic and unsavory gas deals in Boston, never thought of making money. The highest salary he had ever received up to that age was \$1,800 a year. He was born in Jackson County, Ohio, in 1844, and when he was old enough to work became a charcoal burner and was for a long time a day laborer who carried his dinner in a tin pail. When scarcely out of his teens he enlisted, and at Appomattox he was a lieutenant under Custer. After he was mustered out he took up the job of digging trenches for the Portsmouth, O., Gas Company, and in 1869 had learned so much about gas that he was drawing a salary of \$1,500 a year as superintendent of the gas works at Ironton. He patented an apparatus for the purification of gas and sold it, and then became president of the Columbus Gas Company. Since then he has attained special prominence in stockjobbing circles and is about as well known as any man born west of Buffalo. The syndicate of which he is now the head controls the gas companies in St. Louis, Detroit, Milwaukee, St. Paul, Grand Rapids, Jackson, Mich., Long Branch, Red Bank, Asbury Park, N. J., and Madison, Wis. His latest acquisition was the company at Detroit. More recently he has been fighting the Standard Oil Company for control of the gas companies in several large cities, including Boston.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

RECENT COMPANY ELECTIONS.

Bossert Electric Construction Company, Utica, N. Y.—President, William F. Bossert; vice-president, H. P. Crouse; secretary, Frank G. Scofield; directors: William F. Bossert, H. P. Crouse, Frank G. Scofield and Hon. Frank Sang.

Brazil Electric Light Company, Brazil, Ind.—President, E. W. Smith; vice-president, J. E. Sherley; secretary and treasurer, Hugh Stevenson; directors: J. C. S. Bower, W. H. Cordery, William Shaw and J. N. Halstead.

Chicago North Shore Street Railroad Company, Chicago—President, J. L. Cochran; vice-president, L. S. Owsley; secretary and treasurer, Howard Abel; directors: the officers and B. E. Sunny and George Newton.

Chicago General Railway Company, Chicago, Ill.—President, John H. Whitbeck; vice-president, C. L. Bonney; secretary and treasurer, L. C. Bonney; directors: J. J. Black, John H. Whitbeck, C. L. Bonney, Lyman M. Paine, Glenn E. Plumb, L. C. Bonney and N. D. Lawton. Mr. Plumb succeeds L. E. McGann, resigned.

Chattanooga & Lookout Mountain Railway Company, Chattanooga, Tenn.—President, J. T. Crass; vice-president, Vernon Whitehead; secretary, William Cummings; directors: J. T. Crass, William Cummings, Vernon Whitehead, W. L. Frierson and John P. Sanborn of Boston.

Charlestown Gas & Electric Company, Charlestown, Mass.—President, James F. Hunnewell; directors: James F. Hunnewell, James A. Sawtell, Charles F. Byam, John Turner, Charles R. Lawrence, Charles F. Fairbanks and Quincy A. Vinal.

Cleveland Electric Railway Company, Cleveland, O.—President, Horace E. Andrews; vice-president, James Parmelee; secretary, R. A. Harman; treasurer, John F. Whitelaw; assistant secretary and treasurer, Henry J. Davis; general manager, John J. Stanley; directors: the officers and Thomas H. Brooks, Hiram Kimball and A. J. Moxham. Tom L. Johnson having declined re-election as director, the board voted to reduce the number of directors to nine, leaving Mr. Johnson's place unfilled.

Columbus Street Railway Company, Columbus, O.—President, Emerson McMillin; first vice-president and treasurer, E. K. Stewart; second vice-president, Robert E. Sheldon; secretary and auditor, P. V. Burlington; general superintendent, W. F. Kelly; directors: Emerson McMillin, of New York; O. M. Clark, of Philadelphia; E. K. Stewart, R. E. Sheldon, P. H. Bruck, O. D. Firestone, G. W. Sinks, Theodore Rhoads and E. L. Hinman, of Columbus.

Detroit Street Railway Company, Detroit. Directors: Tom L. Johnson, J. C. Hutchins, A. B. Du Pont, W. L. Johnson, Irwin Fullerton, H. A. Everett.

Edison Electric Illuminating Company of Brooklyn, N. Y.—Directors: Frank L. Babbott, E. Le Grand Beers, Charles E. Crowell, Ethan Allen Doty, Julian D. Fairchild, C. N. Hoagland, Darwin R. James, Martin Joost, Edwin Packard, Lowell M. Palmer, George Foster Peabody, Royal C. Peabody and George H. Southard.

Electric Light & Power Company, Syracuse, N. Y.—President, William Nottingham; vice-president, Charles M. Warner; secretary, George M. Barnes; treasurer, George W. Davenport; general manager, Warner H. Girvin; directors: William Nottingham, Charles M. Warner, George M. Barnes, George W. Davenport, Arthur Perry, Alvin J. Belden and William P. Goodelle.

Greenville Electric Light & Power Company, Greenville, O.—Directors: Z. T. Dorman, A. J. Klinger, Samuel Harsh, D. L. Gaskill, L. C. Anderson, A. C. Robeson, W. A. Hopkins, C. J. Herr, J. M. Bickel.

Great Barrington Electric Light Company, Great Barrington, Mass.—President, D. Ward Northrop; vice-president and general manager, Ward Lewis; clerk, F. H. Wright; treasurer, Charles J. Barget; directors: Ward Lewis, P. A. Russell, F. H. Wright of Gt. Barrington, and H. B. Butler and Ward Northrop of Middletown, Conn.

Greenport Electric Light & Power Company, Greenport, N. Y.—Directors: Geo. F. Tuthill, Geo. H. Corwin, T. E. Burns, Dr. B. D. Skinner, Hon. H. A. Reeves, S. J. Higbie, A. M. Salmon, S. B. Horton.

Hartford Street Railway Company, Hartford, Conn.—President, E. S. Goodrich; vice-president, S. G. Dunham; treasurer, D. R. Howe; directors: James J. Goodwin, Charles L. Lincoln, Atwood Collins, Daniel R. Howe, Samuel C. Dunham, E. S. Goodrich and George E. Taintor.

Harrisburg Electric Company, Harrisburg, Pa.—President, E. Z. Wallower; general manager, Charles H. Kinter; treasurer and secretary, H. W. Stone; superintendent and electrician, W. R. Fitzpatrick; directors: John I. Beggs, W. O. Bishop, H. Cohen, Thomas Heist, E. B. Mitchell, H. B. Mitchell, Benjamin M. Nead, Harry C. Ross, H. J. Stewart, Joseph Strouse, E. Z. Wallower.

Holyoke Street Railway Company, Holyoke, Mass.—President, W. S. Loomis; clerk and treasurer, William R. Hill; directors: John Olmstead, Frederick Harris, Austin E. Smith and N. D. Winter of Springfield; W. S. Loomis, W. R. Hill, R. B. Johnson, J. G. Mackintosh and J. F. Sullivan of Holyoke.

Lebanon & Myerstown Electric Railway Company, Lebanon, Pa.—President, J. M. Shenk; directors: S. P. Light, H. H. Kreider, H. C. Harner, C. Shenk, Thomas Evans and Harry Nutting.

Lewiston & Auburn Electric Light Company, Lewiston, Me.—President, H. W. Oakes; treasurer, Daniel Briggs; directors: F. M. Jordan, S. D. Wakefield, J. F. Boothby, N. L. Jordan, L. Linn Small and F. R. Conant.

Lynchburg & Rivermont Street Railway Company, Lynchburg, Va.—President and general manager, H. P. Woodson; vice-president, John P. Pettyjohn; secretary and treasurer, James I. Bowman; directors: John P. Pettyjohn, W. C. Ivey, R. I. Owen, R. T. Watts, R. J. Snead, H. P. Woodson, Mrs. Ellen M. Wall.

Mahoning Valley Southeastern Railway Company, Youngstown, O.—President, John E. McVey; vice-president, L. W. King; treasurer and general manager, A. A. Anderson; secretary, C. Y. McVey; directors: A. A. Anderson, John E. McVey, L. W. King, H. M. Robinson and C. Y. McVey.

Mt. Tom Railroad Company, Holyoke, Mass.—President, W. S. Loomis; treasurer, W. R. Hill; directors: W. S. Loomis, Frederick H. Harris, R. B. Johnson, Dr. H. O. Hastings and G. S. Graves.

Rochester Railway Company, Rochester, N. Y.—President, Frederick Cook; vice-president and general manager, T. J. Nicholl; secretary, G. G. Morehouse; treasurer, F. P. Allen; directors: Frederick Cook, T. J. Nicholl, J. N. Beckley, E. H. Satterlee, Erickson Perkins, E. M. Utton, H. P. Brewster, J. Gerling, G. W. Archer, T. De Witt Cuyler, Horace Magee, Benjamin Graham, H. Sellers McKee.

Scranton Illuminating, Heat & Power Company, Scranton, Pa.—Directors: Franklin Howell, Theodore G. Wolf, Walter Briggs and Fred C. Hand, Scranton; Clinton W. Wiener and Henry W. Darling of New York, and Edwin D. Mullen of Philadelphia.

St. Louis Electrical Supply Company, St. Louis, Mo.—President, E. Ruebel; vice-president and treasurer, W. N. Matthews; secretary, Russell Stanhope. The officers constitute the board of directors.

Toronto Street Railway Company, Toronto, Can.—President, William McKenzie; vice-president, James Ross; manager, E. H. Keating; directors: William McKenzie, James Ross, F. L. Wanklyn, W. D. Mathews, James Gunn, O. L. Porteous and George A. Cox.

Utica Suburban Railway Company, Utica, N. Y.—President, John W. Boyle; vice-president, Charles E. Smith; secretary, John H. Grant; treasurer, Charles W. Mather; directors: John W. Boyle, C. W. Mather, Charles E. Smith, James T. Gardner, B. B. Putney, John S. Capron, John H. Grant, R. G. Young, Edward Peckham.

West Chester Street Railway Company, West Chester, Pa.—President, William M. Hayes; directors: R. T. Cornell, A. G. McCausland, M. H. Matlack, J. Carroll Hayes.

Worcester Traction Company, Worcester, Mass.—President, T. C. Barr; vice-president, O. H. Clark, Jr.; treasurer, E. J. Moore; directors: Thomas C. Barr of East Orange, N. J.; C. Howard Bullock of Philadelphia; Cassius M. Wicker of New York; A. George Bullock, Francis H. Dewey, Charles B. Bratt and Stephen Salisbury of Worcester.

Worococ Street Railway Company, Westfield, Mass.—President and general manager, J. A. Lakin; vice-president and secretary, James H. Bryan; treasurer, Charles J. Little; superintendent, W. S. Townshend; directors: L. S. Stowe of Springfield, James A. Crane, James A. Lakin, R. B. Crane, D. L. Gillett, T. J. Cooley, R. W. Parks, James H. Bryan and R. D. Gillett.

COMMERCIAL PARAGRAPHS.

The latest and best transformers. Such is the announcement the Wagner Electric Manufacturing Company of St. Louis, Mo., desires to make to the trade. The last year has developed a much keener appreciation by central station men of the vital part played by the transformer in economical central station distribution, and there has gradually appeared a demand for an increased operating efficiency in transformers. Such a tendency the Wagner Electric Manufacturing Company has constantly endeavored to stimulate. With their type D transformer, which has stood without a competitor for several years, this company has achieved an enviable success. From the first day of its entrance into the field of transformer building this corporation has constantly carried on extensive experiments with no other end in view than the development of its apparatus as rapidly as the conditions of the general trade demanded it. The type D line marked a material advance over type C; in the same manner the type G now excels the type D.

In the Crescent Telephones manufactured by the Pennsylvania Electric Company of Marietta, Pa., the pertinent points in the way of improvements lie in the magneto bell and the transmitter. The working parts of the bell are arranged in an entirely new and different manner. Instead of being permanently boxed so as to make inspection and repairs inconvenient and difficult, the entire movement of the bell, that is, all the working parts, including generator ringer, coils, automatic gravity hook and all contact points and springs connected therewith, are easily and quickly removable and just as easily replaced in position, all connections and contacts being electrically positive. The use of binding posts and hinges in connection with this bell has been abandoned and large surface contact plates, held together with machine screws, have been adopted instead. This company also manufactures the Ideal Transmitter, made in accordance with the particular features used in the true "Hunnings" type of transmitter, i.e., a horizontal diaphragm on which carbon dust lies in a loose state rendering packing an impossibility. Any persons contemplating purchasing telephone apparatus would do well to address the above company, who will be pleased to answer any question relating to their product.

We are in receipt of a catalogue recently issued by the Electric Storage Battery Company, Drexel Building, Philadelphia. This work has been thoroughly revised and brought strictly up to date, and as it is fully illustrated and contains a number of tables, should prove of great value to anyone interested in accumulators. This catalogue, which contains about forty pages of matter, devotes almost half of this number to describing various plants in which chloride accumulators have been installed and the advantages derived by the use of storage batteries. As a work of reference it should prove of great value.

We are in receipt of an attractive pamphlet gotten out by the Clyde Steamship Company, 5 Bowling Green, New York, which contains some thirty pages of exceedingly interesting reading matter. This little work, which is fully and handsomely illustrated, describes in a pleasing and entertaining manner the numerous pastimes indulged

in in Florida and other parts of the Sunny South. The Clyde Steamship Company has through its great fleet of ocean ships and perfect service, made the attractive winter resorts in Florida, Georgia and South Carolina so easy of access that the very journey is in itself a delight, long remembered by all who take it. On every Monday, Wednesday and Friday at 3 p. m. one of the steamers of this line leaves Pier 29, East River, New York, for Jacksonville, touching en route at Charleston, South Carolina, and remaining there a sufficient time to afford the tourist an opportunity of visiting the interesting sights and scenes of this historic old "city by the sea." Persons desiring information relating to a trip to Florida would do well to address the above company, who will be pleased to forward a pamphlet with their compliments.

Of all the insulating materials used in the construction of electric machinery, mica is the one which undoubtedly fulfils its mission most perfectly. This substance is, however, liable to fail through mechanical errors in its preparation or application. The Walker Company of Cleveland, O., has devised processes which make the use of mica the most practical as well as the most efficient means of insulation known to the electrical manufacturer. An excellent example of the ingenuity displayed in its use is afforded by the mica rings used to insulate the commutator from the iron spider of the armature and from the shafts of motors or generators from the smallest to the very largest sizes ever manufactured.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

The French engineers sent to the United States to examine and name a truck for the Paris Electric Railway chose that manufactured by the Graham Equipment Company of Boston, Mass., as it possessed very many points of merit, being simple, strong and light, smooth-riding under all loads and entirely free from tilting or oscillation. This company also controls a Brake-Bar to prevent the tilting of car trucks, which is successfully accomplished by means of a simple mechanical principle by equalizing the forces of the power applied to brake-shoes and wheels. The Graham Equipment Company will be pleased to send a pamphlet to any prospective purchaser.

Removal Notice.

We beg to announce to our friends and patrons that on and after February 1, 1898, our office and factory will be found at No. 27 Rose street, New York City.

DE VEAU & Co.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

We are in receipt of a new catalogue recently brought out by the Brown & Sharpe Manufacturing Company of Providence, R. I. This work has been thoroughly revised and brought up to date, and now contains 437 pages, 20 more than the preceding one. There are a large number of tables which make it especially valuable as a book of reference. The principal additions this year to the machines and tools this company regularly manufactures are: automatic cutting-off machine, automatic screw machine, automatic turret forming machine, belt polishing machine, universal grinding machine, improved No. 2, 60", arbors for face milling cutters with inserted teeth, face milling cutters with inserted teeth, inside micrometer gauge, micrometer calipers No. 9 and 11, micrometer depth gauge, screw slotting cutters ground for clearance, slide caliper rule, spiral gears, tools for use in screw machines, lists added to twist drill and steel wire gauge No. 776. The catalogues referred to will be mailed, upon application, to any address without charge.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

INCORPORATIONS.

The Standard Cold Electric Company, Alexandria, Va. Capital stock, \$100,000.

The Consolidated Electric Company, Fort Ann, N. Y.—to furnish electricity for lighting and power in Ft. Ann. Capital stock, \$10,000. Directors: E. L. Ashley, E. J. West and Mrs. Elizabeth H. Ashley.

The La Grande Electric Company, La Grande, Ore.—to establish an electric system in La Grande and Union County. Capital stock, \$100,000. Incorporators: W. B. Sargent, C. L. Fox and J. H. Hunter.

The Elkin Electric Light & Power Company, Elkin, N. C.—to erect, operate and maintain an electric light and power system. Capital stock, \$2,500. Incorporators: Alex. M. Smith, Gilvin T. Roth and Hugh G. Chatham.

The American Heat, Light & Power Company, Baltimore—to deal in lighting and apparatus. Capital stock, \$100,000. Incorporators: Arthur F. Spier, Perry B. McLaren, Nathaniel Z. Seitz, Nicholas P. Bond, Edward P. Hill.

The Arkansas Improvement Company, Colorado Springs, Col.—to own and operate telegraph or telephone lines, railroads, etc., carrying on its principal operations in Arkansas. Capital stock, \$250,000. Directors: J. M. Parker, H. K. Devereaux, K. R. Babbitt, E. J. Preston and L. A. Cole, all of Colorado Springs.

The Fitchburg & Westminster Street Railway Company, Fitchburg, Mass.—to build a line of electric railway from Fitchburg through Westminster to South Gardner. Capital stock, \$100,000. Directors: H. S. Pike, C. R. Streeter, F. L. Rolph, C. A. Simonds, T. S. Wood, C. C. Dawley and G. R. Godfrey.

The Atlanta Water Power Company, Atlanta, Ga.—to develop the water power of the Chattahoochee River between Jones' Shoals and Power's Ferry and use it in generating electricity for transmission to Atlanta and other places. It is understood that at least a million dollars will be invested in the enterprise. The incorporators of the company are: Henry B. Wilson and Emerson McMillin, New York; C. Emerson Smith, York, Pa., a member of a firm manufacturing electric machinery, and R. H. Smith, of Gainesville, who was instrumental in securing options on water power.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JANUARY 25, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

597,799. Electric Railway. Eben C. Crocker, Bridgeport, Conn., assignor of one-half to Edwin C. Howe, same place. Filed April 23, 1897.

597,848. Trolley. George A. Hall, Portland, Me. Filed Feb. 6, 1897.

597,949. Rail-Connector. James Bryan, Pittsburg, Pa. Filed June 12, 1897.

597,062. Device for Preventing Accidents on Railroads. Hermann Biermann, Breslau, Germany. Filed April 6, 1896.

597,864. Car-Fender. Henry C. Spangler, Harrisburg, Pa. Filed May 20, 1897.

597,936. Fender for Street-Cars. John F. Baker, Vincennes, Ind. Filed Nov. 23, 1897.

598,087. Safety-Fender for Street-Cars. William B. Heywood, Gualala, Cal. Filed Aug. 19, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

597,964. Light Refracting and Magnifying Envelop for Incandescent Lamps. Forest W. Dunlap and John R. Quain, London, England, assignors to William Castner Chapin, San Francisco, Cal. Filed June 2, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

597,816. Armature-Winding Machine. Carl Eichemeyer, Yonkers, N. Y. Filed Oct. 30, 1897.

597,855. System of Electrical Distribution. Harvey Linton, Altoona, Pa., assignor of seven sixteenths to Thos. H. Bowman, McKeesport, Pa. Filed May 7, 1894.

597,979. Electric Switch. Jesse L. Hinds, Syracuse, N. Y., assignor of one half to Huntington B. Crouse, same place. Filed Feb. 1, 1896.

597,985. Electric Meter. Gisbert Kapp, Berlin, Germany, assignor to Henry C. Townsend, trustee, New York City. Filed Nov. 19, 1897.

598,001. Electric Switch. James R. Newell, Titusville, Pa. Filed Sept. 15, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

597,782. Telephonic Installation. George Ritter, Stuttgart, Germany. Filed June 11, 1896.

597,785. Apparatus for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed April 16, 1895.

597,786. Telephone-Circuit. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 18, 1896.

597,787. Apparatus for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 18, 1896.

MISCELLANEOUS.

597,753. Apparatus for Making Observations by Means of Roentgen or X-Rays. Jacques Wertheimer, Paris, France. Filed July 27, 1897.

597,790. Electric Cable. Willoughby S. Smith and William P. Granville, London, England. Filed Nov. 1, 1897.

597,916. Manufacture of Storage-Battery Grids. William W. Griscom, Haverford, Pa.; Dora Ingham Hale Griscom executor of said William Griscom, deceased. Filed Nov. 22, 1895.

597,880. Electric Furnace. William S. Horry, Sault Ste. Marie, Mich. Filed April 16, 1897.

597,891. Electrically-Actuated Lock for Bicycle-Racks. Frank V. Walstrom and John Erickson, Chicago, Ill. Filed Nov. 9, 1896.

597,945. Electric Furnace. Charles S. Bradley, Avon, N. Y. Filed Dec. 12, 1894.

597,969. Safety-Fuse. Louis A. Ferguson, Evanston, Ill. Filed May 24, 1897.

598,032. Electric-Signaling Device. Eugene A. Stout, Jr., Philadelphia, Pa. Filed March 23, 1897.

598,044. Electric Burglar-Alarm System. Clyde Coleman, Chicago, Ill., assignor of two-thirds to Albert L. Dean and James W. Donnell, same place. Filed Dec. 14, 1896.

TELEPHONE AND TELEGRAPH.

A letter from Richmond in the N. Y. *Herald* of the 24th ult. gives a history of the telephone contest that has been going on in the Virginia capital for two years past and incidentally refers to the successful establishment in that city of an independent telephone system by the Richmond Telephone Company. The writer states that the telephone in use by the company has proven entirely satisfactory. "It is," he says, "the long-distance instrument of the Western Telephone Construction Company of Chicago, and the construction of the company's lines is admirable, consisting of a complete metallic circuit to each subscriber. The company is now giving service to 1,500 subscribers, and is continually extending its lines and increasing its list. The Southern Bell Company, apparently realizing that the opposition was rapidly driving it from the field, has reduced its charges to \$18 and \$30 respectively for residence and business telephones anywhere within the city limits, but in no case making permanent contracts, and where it finds that those rates are not sufficiently attractive it endeavors by giving entirely free service to keep up its list. It has now about 1,200 subscribers."

A report from Mr. Eugene Germain, late U. S. Consul at Zurich, to the State Department at Washington, regarding the telephone in France, is to the effect that there are at present 112 towns, with a population of 6,000,000, which have 18,191 subscribers, half of whom are in Paris. It is not, however, in Paris that there are the most subscribers in proportion to inhabitants, for at Cannes the proportion is 1 to 120; 1 in 198 at Fourmies; 1 in 215 in Mentone; and 1 in 222 at Tourcoing, as against 1 in 253 in Paris. The telephone is little used in comparison with neighboring countries, like Germany and Switzerland, for while the number of "communications" in France last year was only 74,000,000, the total number for Germany, excluding Bavaria and Wurtemberg, was over 424,000,000. Switzerland with a population barely the tenth of France, had, at the end of last year, over 1,000 miles of telephone lines, with 29,533 subscribers and about 15,000,000 communications. While the cost of telephoning in Switzerland is more than covered by the receipts, the contrary is the case in France, though the subscription price is much higher than in any of the other countries, being as much as \$40 per annum in Paris, and from \$40 to \$60 in provincial towns, to say nothing of each subscriber having to contribute toward getting connected with the system.

The Atlanta *Journal* states that the Standard Telephone Company has a large force of hands at work laying down the conduits for its wires within the fire limits of that city. George F. Payne & Co., Philadelphia contractors, are in charge of the work and will put on a large force of hands and push the work to completion as rapidly as possible. It is the intention of the company to have 1,000 telephones in operation by April 1 and to put in 4,000 telephones during the present year. The company also promises to have 4,000 long-distance telephones in operation in Atlanta, all of the latest patents and modern improvements, and Col. Joe James and Col. Baer are pushing the work as rapidly as possible.

The Southern New England Telephone Company, Boston, reports gross earnings in 1897 of \$595,831; expense and interest, \$480,656; dividends, \$150,660; surplus, \$14,515. At the end of the year there were 9,276 instruments in use, a gain of 1,349 over the previous year. During the year \$200,000 was charged to construction account, the company issuing that amount of additional capital. All but seven towns out of the 168 in Connecticut are now reached by the company's lines. The annual number of messages sent amount to about 13,000,000. At the annual meeting President Hudson of the American Bell Telephone Company was elected a director to succeed A. O. Morgan.

In the General Assembly of South Carolina a bill has passed its third reading which places express, telegraph and telephone companies under the control of the Railroad Commissioners, who shall have full power to regulate the prices to be charged by any company or person or persons owning, controlling or operating any line or lines of express, telegraph and telephone for any service performed. The bill also provides that the companies mentioned shall bear their pro rata share of the salaries of the Railroad Commissioners based on their gross earnings in the State.

The new telephone company of Wellsburg, W. Va., has completed its line connecting it with the Phoenix Company of Steubenville, O. This company operates exchanges at Toronto, Steubenville, Richmond, Wintersville in Ohio, and Holiday's Cove and New Cumberland in W. Va. The companies will connect with the Home Company of Pittsburg.

Articles of association of the New Telephone Company were filed in the office of the Secretary of State at Indianapolis on the 24th ult. This is an independent company which expects to compete with the Central Union Telephone Company, now monopolizing the telephone

business of Indianapolis. The New Telephone Company also intends to operate throughout Indiana.

The People's Telephone Company of Biloxi, Miss., at its annual meeting on the 20th ult. elected the following officers: President, John Walker; vice-president, J. F. McCormick; manager, E. L. Doyle; secretary and treasurer, John Carraway; assistant manager, Warren Suter. The company was organized last May, has been a success from the beginning and is now prosperous.

The common council at Ypsilanti, Mich., has ordered the Bell company to remove its telephones from the city buildings; the instruments of the New State Telephone Company will be installed in their stead. The New State Company has gained a complete victory over the Bell in Ypsilanti. It has in use there 168 instruments while the Bell company has only about one-third that number.

A Northville, Mich., dispatch states that the New State and Northville Telephone Companies will unite their forces and endeavor to do up the local Bell company. The New State has 11 telephones in use and the Northville Company 40, while the Bell has but 8. Prices have been reduced.

The Macon, Mo., telephone system has been purchased by a syndicate of local capitalists with Hon. Theo. Gary at the head, and will at once begin the extension of the lines. The consideration was \$10,000, for which amount the new company will be capitalized.

J. C. Hubinger has finally succeeded in getting permission to erect poles and string wires through Fort Madison, Ia., to connect his Burlington and Keokuk exchanges. Mr. Hubinger will execute a bond for \$2,000 guaranteeing the removal of the poles and wires providing he is not voted a franchise by the people.

At a meeting of the Citizens' Telephone Company of Columbia, Tenn., held since that noticed in the last issue of *ELECTRICITY*, additional subscriptions were secured, and there is now \$4,450 available to pay off the indebtedness. About \$1,000 or \$1,500 is needed for contemplated improvements, and this amount will be obtained without difficulty.

The Southern Minnesota Telephone Company, incorporated recently with a capital stock of \$30,000, will establish a system of telephone lines throughout Murray, Cottonwood and Pipestone counties, and, if desirable, extend the line to other parts of Southern Minnesota.

A new telephone company is being organized in Charlotte, N. C., and will use a metallic circuit system. It is proposed to connect Charlotte with the adjoining towns, and bring Columbia into the circuit, establishing at the same time a rate of 15 cents for long-distance telephoning.

The Park City Telephone Company is the name of a new company that is being organized at Bowling Green, Ky., and will at once begin the construction of new lines. The new company will put the cost of 'phones down considerably and endeavor to run the East Tennessee Telephone Company out.

Mr. Maupin's bill in the Virginia Legislature, providing that instead of the tax of \$1.50 on each transmitter a special tax of 1 per cent. be levied on the gross earnings of telephone companies, has been referred to the House Committee on Finance.

The Southwestern Telephone & Telegraph Company has been granted a franchise at Beaumont, Tex., and will establish a telephone system and exchange there.

A private telephone line is being built between Chelsea, and Pleasant Lake, Mich., a distance of 20 miles. Farm houses will be connected.

The Detroit Telephone Company has decided to buy \$30,000 worth of cable and wire to extend its service.

The Montcalm County (Mich.) Telephone Company has 115 miles of wire and 200 telephones in use.

New Companies Incorporated.

The Haskell & Throckmorton Telegraph & Telephone Company, Seymour, Tex.—to construct, operate and maintain a public telegraph and telephone line and system between the towns of Seymour and Haskell. Capital stock, \$3,000. Incorporators: T. H. C. Peery, G. P. Barber and G. C. Plants.

The Lexington Telephone Company, Lexington, Va.—to manufacture apparatus, build telephone lines and establish an exchange in Lexington. Capital stock, \$5,000. President, W. S. Hopkins; secretary and treasurer, N. C. Watts.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

*Unlisted. †Ex div.

b Company controls Citizens' Railway, North Baltimore Passenger Railway, Baltimore & Curtis Bay Street Railway, Baltimore & Powhatan Railway, Pimlico & Pikeville Railway and Walbrook, Gwynn Oak & Powhatan Railway and Park.

c Owned by Brooklyn Rapid Transit Company.

d Leased to Brooklyn Heights Railroad Co., which guarantees 10 % on capital stock.

e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Heights Company.

f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.

g Owned by Atlantic Ave. RR. and leased to Nassau system.

h \$90 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.; \$200,000 of stock owned by North Chicago Street Railroad Company.

i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.

j 18 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$625,000 of stock owned by West Chicago Street Railroad Company.

k Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,000 stock guaranteed by West Chicago Street Railroad Company, lessee.

l Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

*Unlisted. † Full paid. ‡ Outstanding. † Ex div.

a Leased to New Orleans Traction Company at 6 % on stock.

b Leased to New Orleans Traction Company at 8 % on stock.

c Leased to Central Crostown Railroad at 8 % on stock and interest on bonds.

d Operating the former Met. Trac. system, that corporation having become extinct.

e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.

f Leased to Houston, West Street & Pavia Ferry—now Metropolitan Street Railway.

g Leased to Metropolitan Street Railway at 8 % on stock until Oct. 1, 1897; thereafter 9 %

h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1896, at \$215,000 per annum.

i Leased to Metropolitan Street Railway for 18 % on stock.

j Leased to Met. St. Ry. for 99 years from April 20, 1892; e % first 5 years, 8 % thereafter

k Leased to Metropolitan Street Railway for \$145,000 per annum.

l Leased to Metropolitan Street Railway for 18 percent. on capital stock.

m Controlled by Third Avenue Railroad by purchase.

n Dividends of 1 1/2 % yearly guaranteed by Consolidated Traction Company.

o Controls by lease the Allegheny, Cent., Citizens, Duquesne, Fort Pitt and Pitts'h Trac. Co.

p Leased to Consolidated Traction Company for 8 % per annum on par value

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 10½@10¾c.; Lake, 10½@11c.; cast, 10½@10¾c.

The St. Lawrence Power Company of Massena, N. Y., has filed with the Secretary of State a certificate of the payment of its entire capital stock of \$6,000,000.

McEniry's bill in the Illinois Legislature to tax the gross receipts of gas and electric lighting companies 4 per cent. was killed when brought to a vote.

The directors of the New England Telephone & Telegraph Company have declared the regular quarterly dividend of \$1.50, payable February 15. Books re-open February 16.

The new company that is to absorb the electric lighting companies in Philadelphia will be incorporated in New Jersey under the title of the Pennsylvania Manufacturing Company. It will have \$15,000,000 of stock and \$15,000,000 of bonds.

The directors of the Wheeling & Elm Grove Railway Company of Wheeling, W. Va., have voted to make an issue of \$225,000 worth of bonds to secure the funds necessary to build and equip the proposed extension of the road. The securities will be of the denomination of \$500.

The Cleveland General Electric 6 per cent. 530 gold bonds of 1,923 have been called for payment on March 1, 1898, at 102 per cent. and interest. Spencer Trask & Co., 27 Pine street, New York, offer to exchange the above called bonds for new first mortgage refunding gold 5s. of the Cleveland Electric Illuminating Company.

A mortgage for \$350,000 in favor of the St. Louis Trust Company has been filed in the St. Clair county recorder's office at Belleville by the St. Louis, Belleville & Suburban Electric Railway Company. The company, which is incorporated with a capital of \$350,000, is building an electric car line along the St. Clair turnpike from East St. Louis to Belleville.

A special meeting of the stockholders of the Syracuse & East Side Railway Company will be held in the office of the company at Syracuse, N. Y., on the 8th inst., for the purpose of voting upon a proposition to increase its capital stock from \$250,000 to \$375,000, consisting of 3,750 shares of the par value of \$100 each; also for the purpose of voting upon a proposition to classify the capital stock of such corporation into preferred and common stock.

We are indebted to Messrs. Spencer Trask & Co., bankers, 27 and 29 Pine street, New York, for a copy of their "Statistical Tables" for January, 1898, giving important information relative to securities dealt in on the New York Stock Exchange. The company issue these Tables annually for distribution among their clients.

The Detroit, Ypsilanti & Ann Arbor Electric Railway Company has filed a mortgage for \$600,000, to secure an issue of 6 per cent. 20-year bonds for a like amount. The mortgage runs to the Union Trust Company and is signed by J. D. Hawks, president, and John A. Russell, secretary.

The Flynn and Boland syndicates have succeeded in getting a controlling interest in the People's Traction Company and the Westchester & Connecticut Traction Company. The two roads together control about sixty miles of street railroad in the Harlem and Bronx districts, in the northern suburbs of New York.

To enable the Union Railway Company of New York to appeal to the United States Court of Appeals, Judge Wheeler on Friday last suspended for thirty days the injunction he granted recently to the Sprague Electric Railway & Motor Company, restraining the Union Railway Company from continuing the use on its cars of an electric motor of which Frank J. Sprague is alleged to have been the inventor. The Union Railway Company is forbidden, however, to purchase additional motors.

A New York correspondent in the Philadelphia "Press" of the 29th ult., says: "Within a week or ten days it is probable that the negotiation for the consolidation of various trolley lines in New Jersey into one system stretching from Jersey City to Philadelphia will be completed. The negotiations have been somewhat secretly carried on and it is not known how large a capitalization the single system will possess or what the exact terms of the financing and assimilation are."

On the 27th of January the stockholders of the Hestonville Company, at Philadelphia, by a vote of 47,043 shares against 420 shares, ratified the 999 year lease to the Union Traction at a rental of 6 per cent. on the preferred and 4 per cent. on the common stock. By the terms of the lease the Fairmount Park & Haddington road is assigned to the Union Traction, which assumes the dividends guaranteed on that stock. The Union Traction also assumes the bonded debt of both the Hestonville and Haddington companies.

Judge Wickes, of the Baltimore Court, has decided to sign a decree for the sale of the Columbia & Maryland Railroad, the proposed electric railway between Baltimore and Washington. The road has been in the courts under various forms of litigation for some time. William L. Marbury, as trustee under the first and second mortgages, will conduct the sale. The properties included are controlling interests in the Belt Railroad and Soldiers' Home Railway, both of Washington; the Maryland & Washington Railroad, stock and bonds of the Catonsville short line steam railroad, power-house, etc. It is said that the Baltimore Security & Trading Company has liens on the properties to the extent of over \$2,000,000. The road is completed from Washington to Laurel.

The Lehigh Valley Construction Company of South Bethlehem, Pa., who had the contract to open the great Massena power canal, has filed an assignment in the St. Lawrence County clerk's office at Canton. This company has been constructing a canal two hundred feet wide and three miles long from the St. Lawrence to the Grass River at Massena. Their contract price for this work was about \$3,000,000. The company has filed a mechanics' lien against the power company for \$53,000, claiming to have done \$78,000 worth of work during the past summer, for which it has received only \$25,000. The St. Lawrence Power Company is capitalized at \$6,000,000.

President Orr of the Rapid Transit Commission has expressed the opinion that the extensions of the Manhattan Elevated system which Mr. Gould proposed do not solve the problem of rapid transit. He thinks the only solution lies in an underground system. He says: "Even should the Manhattan plans be approved by the Commission and carried out, the urgent necessity of an underground road would still remain. As I have pointed out many times before, the existing transport companies would be benefited by the building of an underground system, because it would tend immediately to develop the city to the northward, would lead to the laying out of more residential districts, and would create a vast amount of new traffic, of which the surface and elevated companies would get a large share."

A semi-annual dividend of \$3.50 has been declared on United Electric Securities preferred stock, payable May 2, to stock of record April 20. The company has passed three semi-annual dividends. Payments have usually been made in February and August. "The change in dates," says the Boston "Herald," "is made for convenience, since the coupons on the company's bonds fall due in February, and it is easier to finance the two payments separately than together. The company is said to have earned the dividend. Three experts have examined the assets, and find a value equal to the bonds and shares, preferred and common, and \$80,000 to spare. The capital is \$1,000,000 preferred and \$500,000 common stock. The General Electric Company holds all of the common stock, which receives no dividends. The company issues \$1,000,000 collateral bonds against \$1,250,000 miscellaneous bonds supplied it by the General Electric Company, turning over the former in exchange. The United Company handles these securities, collecting interest and selling the same, and off the income and profit retires the collateral bonds at 103 and pays dividends. The United Company thus operates as a finance company to the General Electric Company."

ELECTRICITY.

Vol. XIV.

NEW YORK, FEBRUARY 9, 1898.

No. 3.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4021 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES,	\$2.50
IN CLUBS OF FIVE OR MORE,	2.00
FOREIGN COUNTRIES,	4.50
SINGLE COPIES,	10 cents

ADVERTISING RATES:

As *ELECTRICITY* reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application. Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

EDITORIAL NOTES.

The Electrical Resistance of Alloys.

In this week's issue we publish the first part of what appears to be a really very important paper on the electrical and mechanical properties of alloys.

If the author's deductions are found to be correct, we shall, for the first time, be placed in a position to determine *beforehand* the electrical properties of any alloy that may be made.

Many years ago Matthiessen claimed to have deduced from his work a general law which would enable him to determine *a priori* the general electrical properties of alloys, but Mr. Weston's elaborate researches, which resulted in the discovery by him of alloys having practically no temperature coefficient, and the further most remarkable discovery that certain alloys had a negative temperature coefficient, demonstrated beyond a reasonable doubt that Matthiessen was in error.

But Mr. Weston's investigations also proved that Matthiessen was also in error in assuming that german-silver had either a definite temperature coefficient or a definite specific resistance. Indeed Mr. Weston's researches showed that the specific resistance of german-silver increased as the percentage of nickel used increased, and that its temperature coefficient decreased as the resistance increased, and consequently it was not safe to adopt Matthiessen's values for this alloy.

Mr. Weston, however, made numerous and exhaustive researches along this line, extending to hundreds of alloys, and it is only from a sense of justice that we make the statement that it was he, and not Dr. Feussner as some people seem to believe, who discovered the properties of the nickel copper alloys referred to in the paper.

In connection with this matter, we advise any one interested in the subject to read each of Dr. Feussner's papers on the subject of resistance alloys and to note the point from which Dr. Feussner started, and it will be found that he commenced his researches on alloys of the exact composition and proportions described in Mr. Weston's United States patents. Indeed we think that Dr. Feussner's position in this is that of having intentionally but bunglingly sought to reap the whole credit due to Mr. Weston's prior work, and amongst most writers on the subject of resistance alloys Dr. Feussner and the German Imperial Reichsanstalt are given credit for the work actually done by Mr. Weston.

The manner in which this has been done will however be certain to result in disgrace to Dr. Feussner, as it is the most daring piece of scientific robbery that has come to our notice for some time, and we trust that Mr. Weston will deal with the subject in the near future.

Cast-Iron as an Insulator?

Mr. C. B. Martin, the electrical engineer of the Brooklyn Bridge, in answer to all that has recently been published regarding the possible corrosion of metal in that structure by the trolley currents, makes the following statement in the *Brooklyn Eagle*:

"There seems to be a disposition in this portion of the country to find fault with all our public works and thus make the general public afraid. Out West the press and people take a pride in their public buildings and bridges, and if there was anything wrong there would be more of a disposition to keep it from the public, for the very reason that lives might be endangered by a feeling of fear. It was this fear that was responsible for the terrible calamity that marked the opening of the bridge. The press had said that the bridge was not safe, and the panic was due to this feeling on the part of the people on the bridge at that time.

"So much has been written in regard to the danger of the bridge from electrolysis, that it seems unnecessary to deny it, as has already been done in the columns of the *Eagle*. The public need have no fear on this score, however, as the bridge is perfectly insulated. It is true that the steel is subject to electrolysis, but as the corrosion is caused by the return current we have provided for any damage from this source. This insulation of the bridge is accomplished by the fact that the cables or connections of the bridge are fixed in the masonry at the anchorages, which are made of cast-iron. Cast-iron, as was shown by the exhaustive report of the subway commission, which dug up pipes all over the city, is impervious to electricity."

Mr. Martin apparently jumps to the conclusion that it is the purpose and intent of the public press in the East to pick out flaws in various public works for the sole purpose of having something sensational to write about. This may be so in the case of a few sensational dailies, but we think the better class of papers have referred to the possibility of the Brooklyn Bridge being affected by electrolysis in order that proper precautions should be taken to prevent such an occurrence taking place. As we stated in a former editorial, there would seem to be very little chance of any serious damage being done, but it is by no means impossible, and so long as such is the case every precaution should be taken to prevent the return current from reaching the iron work of the span, or some method adopted for maintaining the anchorages at both ends at the same potential. Mr. Martin's last statement regarding cast-iron would seem a rather curious one. It is unquestionably true that corrosion does not take place anything like so quickly with iron as, for instance, with lead, for while an ampere of current will dissolve in a year approximately 75 pounds of the latter metal, this same current will dissolve in the same space of

time but 20 pounds of iron. Experience has shown, however, that cast-iron is by no means exempt from electrolytic action, and several photographs were exhibited at one of the meetings of the American Institute of Electrical Engineers a few years ago of cast-iron pipes taken from the ground at Milwaukee which were terribly pitted, and it was further stated that sections of this main had to be renewed owing to electrolytic corrosion three times in the course of two years.

If Mr. Martin is placing any great reliance on the insulating qualities of cast-iron as a protection to the anchorages, it might be advisable for him to speedily adopt some other method of preventing electrolytic action.

* * *

Electric Semaphore Signals.

Two different types of electric semaphore signals for railroad work have recently made their appearance. These devices, made in different parts of the country and produced at nearly the same time, have proved eminently successful. Engineers and electricians have been striving for a number of years to produce something satisfactory in this line, but it is only lately that their efforts have been rewarded.

Although it is only recently that electricity has been successfully and economically applied to semaphore signals, the electric current has played an important part in railroad signaling for some time.

Shortly after the block signal idea was thought of, an automatic signal of this nature, operated by compressed air and electricity, was invented. This was speedily adopted by the various railroads and was operated until what is known as the electric disk or banjo signal made its appearance, some few years ago. This latter proved fairly reliable and could be operated so extremely economically that it was generally adopted throughout this country.

Usage however brought out a serious defect in this class of signals, as they indicated danger by a change of color and not by a change of position as does the semaphore. Thus engineers often experienced difficulty in making out the signal at a sufficient distance ahead of their train. The fact that the disk signal could be operated by a low power primary battery has made it extremely valuable, especially for through line use, and accounts in a great measure for its having been so extensively adopted and so long retained notwithstanding the serious defect just mentioned.

The new electric semaphores are made in two different types, and differ radically from each other in appearance. One of them much resembles the old mechanically operated signal on a wooden pole, while the other is unlike anything of the kind that has yet appeared. The former is operated by a small electric motor which is located inside an iron case attached to a bracket fastened to the side of the pole. The working of the mechanism is as follows: When the section of track next ahead of this signal is clear, the current from a set of strong primary batteries is turned on and the motor operates until the signal has taken the "all clear" position. When a train reaches that section of the track the blade is released and gravity drives the motor and gearing back to the "danger" position.

The other type of electric semaphore is an extremely handsome and ingenious device. It consists of an enameled aluminum blade mounted on an iron pole. All the moving parts are carefully protected from the weather by being enclosed in the iron post, even to the batteries, which are located in the base. Wherever there is a moving part, ball or roller bearings have been introduced with a view to reducing friction to a minimum and consequently the amount of power necessary to operate the semaphore. Every precaution has been taken in its construction to make it as light and durable as possible, and as a consequence it can be operated with but few batteries.

This signal differs in its operation from the one

previously mentioned only in an electric release for the blade when the section of track it governs is occupied by a train. Then a catch held by an electro-magnet is released and the blade rises to the danger position without turning the armature of the motor.

A semaphore of the above type has been in successful operation on the Pennsylvania Railroad near Philadelphia for several months, so we are informed, on an extra busy section of track.

Another electric semaphore, to be used for signaling between naval vessels, has recently been invented by Lieut. B. A. Fiske. The semaphores to be used for the above purpose are six feet in length by six inches in width, and four in number, arranged one above the other on the masthead. When not in use they hang down against the mast and are invisible at a distance. To bring one into action an electric circuit is closed by an operator in another part of the vessel, and by means of an electro-magnet the semaphore can be made to stand either at right angles to the mast or at an angle of 45 degrees. It is claimed that the semaphore is more readily distinguished than small flags.

An electric semaphore signal which can be operated economically and well would unquestionably be very generally adopted by railroads throughout this country, as it would enable greater speed to be made and reduce the chances of accidents.

* * *

An Electric Ice Boat.

A rather interesting and novel test was recently made on Chevy Chase Lake, near Washington, of an electric ice boat. This vehicle-sledge, as it might be termed, is the invention of Mr. Chas. Steffgen, who entertains hopes of its proving of great commercial value in northern regions as a means of transportation.

The model which was tried at Washington was but 36 inches in length and fitted with a one-tenth horse-power fan motor. Notwithstanding this fact, it is said to have successfully drawn a load of 910 pounds against a strong breeze. The floor of the car is mounted on two pairs of movable runners, which allows of the machine being guided in any desired direction. On the rear of this platform the motor is located. The propelling apparatus consists of a metal wheel, much resembling a circular saw in appearance, which passes down through the floor as does the centerboard in a sailboat. By means of a set of bevel gears the speed of the motor is reduced and transmitted to a small sprocket wheel. The motion is again transferred by a link chain to a larger sprocket attached to the propelling wheel. In this way the machine may be geared to any desired speed. The teeth on the propelling wheel are pressed into the ice by the weight which they support, and it is thought that owing to this circumstance three or four feet of snow may easily be run over with a full size machine.

With 1½ amperes of current at 110 volts a weight of 910 pounds was easily hauled by this little sledge at a moderate speed.

It is proposed to equip the full size machines with a 15 horse-power motor to be operated by means of storage batteries. The propelling wheel will be ten feet in diameter and three-quarters of an inch thick, made of some non-corrosive metal.

From the results obtained with the working model the inventor confidently expects that with a full size machine he will be able to attain a high speed, probably sixty to seventy miles an hour. Over an evenly frozen surface such as a lake, with just sufficient weight to give the teeth a good hold on the ice, it is by no means improbable that a high rate of speed could be attained at times, but it is scarcely to be expected that such speed could be constantly maintained under working conditions.

It is thought that some such device as this could be used to advantage on the Yukon River in Alaska during the winter season, but it is Mr. Steffgen's intention to apply his invention more particularly to

lumbering and similar commercial pursuits in northern countries where no facilities for transportation exist.

Under the Searchlight.

Notes and Comments on Various Topics.

We called our readers' attention in our issue of November 24, 1897, under the head of "Top-Heavy Capitalization," to a report issued by the Akron Street Railway & Illuminating Company of Akron, O., and certified to by the Audit Company of New York.

In this report the franchises were estimated at \$1,500,000, which we thought stupendous considering the size of Akron.

We are not surprised that this road has gone into the hands of Hon. George W. Crouse, of Akron, and Alfred O. Beebe, of New York City, as receivers, upon application of the Manhattan Trust Company, the trustee of the bondholders. This was brought about by the railway company's failure to meet its January interest coupons. There is some talk of the company being reorganized. In addition to the \$1,000,000 worth of bonds held by the trust company, it is said the railroad is mortgaged to other corporations in the sum of \$185,000. There is also said to be unsecured liabilities to the extent of \$75,000.

This is simply another case of a company's being so heavily capitalized that it is next to impossible for it to earn dividends on its stock and bonds.

It seemed remarkable to us at the time that the Audit Company of New York, Mr. Ralph Beach, Mr. F. W. Child and Mr. L. H. Conant, should lend their names to an advertising scheme of this nature, for it must unquestionably have been done with their full consent. For a new concern such as the Audit Company this is certainly not a very good beginning.

* * *

General Electric's Prosperity.

(Succinctly dispatch in N. Y. News Bureau.)

The plant of the General Electric Company is employed day and night to keep up with its work on hand. It is stated on excellent authority that the company will enter on its new fiscal year with new contracts to the amount of \$1,000,000. It is stated that the company has cash on hand amounting to about \$2,500,000. Last week's net earnings showed an exceptionally heavy increase over the same week of the previous year.

If the above organization has so much ready cash on hand, why don't it pay the \$1,339,380 owing on preferred stock dividends? It must be exceedingly aggravating for the stockholders, who have received nothing for years, to be constantly told of the prosperity of the company.

* * *

The Bernstein Failure.

Regarding the Bernstein Electric Company, the assignee, Gen. Benjamin F. Beach, declines to make any statement respecting the liabilities and assets of the company. He apparently is not ready as yet to make any statements.

The last certificate of condition filed by the Bernstein Electric Company, on March 30, 1897, shows as follows: Capital stock, \$100,000. Paid in, \$97,300. Assets: Machinery, \$26,370.63; cash and debts receivable, \$20,459.38; manufacturers' merchandise—material and stock in process, \$52,199.97; patent rights, \$120,859.61; miscellaneous, \$502.73; total, \$220,392.32. Liabilities: Capital stock, \$97,300; first mortgage bonds, \$90,000; other indebtedness, \$22,110.02; balance profit and loss, \$9,982.30; total, \$220,392.32.

At the time the above certificate was filed Mr. E. W. Gilmore, as president and Mr. James Bradley treasurer, both from North Easton, Mass. The striking feature of the above certificate is the exceedingly high value placed upon the patent rights, namely, \$120,859.61. It would seem as though every enterprise in which Mr. Charles A. Coffin is

interested has its assets invariably swelled in this manner.

* * *

THE LAMP-LIT LOCK.

McFuddle had a constant drouth that wracked him day and night,
And led him into habits that were anything but right,
The chief of which was striking home immoderately tight.

His face was known in all the bars for twenty blocks around,
And every one who knew his ways knew where he could be found
As long as he could hold himself rectangular to the ground.

On reaching home full loaded he was often troubled sore
To localize the keyhole in the residential door,
And from side to side and end to end the panels would explore.

Sometimes for several minutes this proceeding would proceed
Before he found the orifice of which he was in need,
And then the pesky key would drop and make him wroth indeed.

To look for it was waste of time, so he preferred to swear,
Which always roused his patient wife, a-nodding in her chair,
And she would rush to let him in and help him up the stair.

But patience in the best of wives is subject to decay,
And her's, so lamentably tried, was ebbing fast away—
She was a fool to bear with him she heard the neighbors say.

Still what she dreaded most of all was his nocturnal fumbling
Around the keyhole of the door and consequential grumbling,
In sight of scores of peering eyes, her wifely feelings humbling.

So she bethought her if she could some simple way devise
To bring the keyhole quite distinct before her husband's eyes,
'Twould save her many a vigils and much unrest likewise.

One day it flashed upon her mind as sudden as a shock,
There was a small electric lamp that lighted up a lock,
And she looked up the ad. and found where it was kept in stock.

It didn't take her long to get an expert electrician,
Who promptly had the lamp installed in the desired position,
And then she told McFuddle all about the new condition.

He saw the point, was somewhat piqued, but praised his wife's design—
In fact, declared her little plan ingenious and fine,
And later sought his favorite bar and there set up the wine.

Believed of all impending care, he slung the throttle wide,
And set a pace whose giddy speed his fastest chums defied;
No rounder in the town that night his drinking record tied.

When midnight came they sent him home completely filled with "booze,"
With dinted hat and clothes awry and lager-spattered shoes,—
He looked like Schiller's hapless bark returning from her cruise.

He managed to get up the steps and spied a streak of light
Just where the keyhole used to be, if he could judge aright—
And this must be his wife's device to aid his errant sight.

It gave a prod to consciousness, and fingering for his key
He brought it forth, with sense enough to hold it cautiously,
And aimed it at the jet of light that he could plainly see.

He missed his mark, the little beam still met his puzzled gaze,
But what did more his muddled mind to startle and amaze
Was seeing duplicated lights replace the single blaze.

He tried again, but as before, he failed to reach the goal,
And now a dozen mimic lights seemed dancing round the hole—
The "booze" was getting in its work and gaining full control.

So rapidly increased the jets in number and in size
That soon a myriad gleaming orbs were imaged in his eyes—
Was he in an electric show or sailing through the skies?

Roused by his fears he flung himself against the offending door,
And jabbed at every spot of light its glittering surface bore,
And surged about and backed and filled and knocked his knuckles sore.

Then paused awhile to gain his breath, and with a savage yell

He tried the tactics of the goat and plunging forward fell
Headlong into the vestibule and threw his wife as well.

Awakened by the racket, she had hurried to his aid,
And had the door wide open when his final rush was made,
But was too slow in drawing back and so was struck, she said.

She scrambled quickly to her feet, unhurt but terrified,
And then to raise the "catapult" with all her might she tried,
But he was of the heavy weights and very drunk beside.

In her extremity she called the watchman and his friend,
The local "cop," and they could scarcely stand him up on end

Although assisted by the strength that size and muscle lend.

With much ado they bore him to his rooms just overhead,
And partially disrobing him they laid him on the bed,
Then pacified his sobbing wife who feared that he was dead.

A doctor summoned by a friend soon "diagnosed" the case;
He found some fever in the pulse, some bruises on the face,
Strong symptoms of exhaustion, but all the bones in place.

Then having heard from first to last the wife's suffused narration,
He told her to dismiss her fears, 'twas but severe prostration
Induced by potable excess and keyhole inflammation.

Th' prescriptions that he gave her brought the patient round all right,
Who in a week assured her he was feeling "out of sight,"
Then made a vow to mend his ways and stay at home at night.

The lamp was taken from the lock, and worn as a charm
Now serves to keep McFuddle out of many kinds of harm,
For every time he looks at it his conscience takes alarm.

* * *

Couldn't Start the Road.

Curious things occur in the operation of underground trolley systems. When the electric current was first turned on the downtown section of the Madison Avenue line in New York to test it, the night before the cars were to start running, the current breaker for that section popped out with a bang, denoting a short circuit somewhere along the line. As there was nothing in the vicinity to account for this, it was finally decided to follow the slot along from the power house and find the trouble. This was done, and after some hours the trouble was located at the curve where the line turns from Fourth Avenue into Astor place. There some laborer, extra careful of his shovel, which was his own property, had stowed it away for the night handle down and with the blade carefully pressed up diagonally between the two current-bearing conductors. When the men tried to remove it they found it was firmly welded to each rail and had subsequently to be cut away with chisels. It was a fortunate thing for the laborer that the current was not turned on when he stowed the shovel away so carefully.

* * *

A BILL has been introduced in the House of Representatives at Washington declaring trusts or combinations of any kind whatsoever to be illegal, and persons engaging in or maintaining the same in any way to be deemed guilty of a felony, proof of which shall subject the guilty party to a fine of not exceeding \$10,000 and imprisonment for not more than 15 years nor less than two years. The bill further declares that every person monopolizing, or even attempting to do so, any part of trade between the several States or between foreign nations, shall be guilty of a like crime, punishable in the same manner. The bill carries with it the power to invest Circuit, District and State courts with authority to try such cases. Property owned by any such combination being transported from one State to another would be forfeited to the United States, and would be seized and condemned by proceedings similar to those provided in the case of forfeiture of goods imported into the United States contrary to law. Any person injured by such corporations or combinations may bring suit in the various courts named, and he would be able to recover twice the amount of the damage sustained, the costs of the suit, also a reasonable fee for his attorney. The author of the bill is Representative Greene, and it has been referred to the Committee on the Judiciary.

THE PRACTICE OF THEORY.*

BY J. C. M'MYNN.

The subject of this short paper reminds me of a trolley car, for the reason that it can be turned either way and run equally well. Whether the subject should be the "Practice of Theory" or the "Theory of Practice" I must leave for your judgment.

In the development of electrical machinery, together with the necessary steam auxiliaries, theory and practice have been the complements of each other, and neither could have reached the present stage of perfection without the assistance of the other.

Theory is much more progressive, and as a usual thing precedes practice, for practice paves the way, lays the track, and makes it possible for the practical man to become a factor in the engineering profession.

The object of this paper is neither to praise nor decry theory or practice, but to simply recall to your minds the close relations existing between the theoretical man and the practical engineer. To a certain extent we are all theorists, for we have our own original ideas and fancies, and oftentimes the engineer who prides himself on his being a practical man is the most theoretical.

However, it is with regret that I notice that the old-fashioned engine driver is fast disappearing. How he could sneer at and deride "book learning" and "book-foolishness!" But he deserves our respect and admiration for the success he attained and the hard work which he expended happily but unnecessarily. He knew nothing of the B. T. U. in his coal, nor of the entrained moisture in his steam, nor of the hyperbolic curve in his engine, but he managed to keep his engine and plant going, and to still have time to ridicule "book learning."

We have also met the theoretical engineer or college boy who could calculate the thermal efficiency of an entire plant from the coal pile to the incandescent lamp, but who could not start a Corliss engine, and who would be worthless in an emergency.

Neither of those men fill our ideal, but a proper combination between the two will give us an able, earnest, thoughtful and cautious engineer. Engineering colleges are to-day turning out, year after year, educated engineers who are exerting a strong influence on the profession, which is resulting in a strong union of practice and theory, the outcome of which must necessarily be engineers of a high standard, with broader and deeper foundations of learning and experience.

In my idea the application of theory to practical work is of the utmost importance to every owner of steam and electrical machinery. In construction work as well as in operation it is most valuable. To be sure, an engineer can consult a text or hand book and can there find out that masonry will sustain certain loads or that a girder of given dimensions will support a certain weight, but if he is unable to understand "the how" and "the why" he is much more liable to make an error. One may read that phosphorus is detrimental to boiler and other steel, but if the reason is not clear, can one appreciate the danger arising from its presence?

To a certain extent, the manufacturer represents the practical side of engineering, while the inventor and consulting engineer represent the theoretical side, yet frequently the manufacturer sees the advantage of practising theory, and in such cases we see experimental laboratories established in large plants and original research carried on under the supervision of the most competent theorists.

I firmly believe, after mature observation, that the educated engineer who can master practice as well as theory is the one who will rise above his competitors in the future. Yet do not understand that by "educated" I mean necessarily a college graduate. A man who can master the laws of mechanics and can conquer mathematics by his own

* Paper read before the Northwestern Electrical Association, Milwaukee, Wis., January 19, 1898.

exertions is deserving of more credit than one who was sent to college and learned simply because it was pounded into him.

Nearly every modern machine is an example of the practical application of mechanics and design to theoretical ideas and discoveries, which thus become mechanical laws. Men knew that the electric current would some day become of commercial value, and long before the perfected dynamo appeared the laws governing the generation of the current were known.

A recent invention is a good example: For years we have known that a boiler feed-pump was doing much more work than was necessary, for if water were pumped into a closed tank at an elevation above the water level and then this tank were opened into the boiler, the water would run into the boiler by gravity. The invention consists of forcing the water to a level above the boiler, and then shutting valves and utilizing gravity. The saving made is about 85 per cent. of the steam formerly used by the pump. I simply mention this as a good example of the practice of theory.

In a certain way, theory is the foundation and practice the structure of an engineer's attainments. The deeper and more substantial the foundation, the higher and more imposing can be the superstructure; the more substantial the foundation, the more resistance will the structure have to either the winds of adversity or the more dangerous gusts of flattery and adulation.

THE TRANSFORMATION OF ENERGY IN THE ELECTRIC ARC.*

The mechanism of the conversion of electric energy into heat in the electric arc still evades the inquiries of experimenters, but papers are from time to time published dealing with the subject, and new suggestions made, and new conclusions reached, without any conspicuous approach to an explanation of what occurs. Mrs. Ayrton's laborious and systematic observations are in recent years the most important of these contributions. Of course "explanation" in such a case as this means no more than that the phenomena are shown to be subject to laws and conditions which are ascertained and well recognized in other cases, even though the mode of action in the latter may be quite obscure. The reference of the planetary motions, and the weight of terrestrial bodies, to one law of the attraction of gravitation, is called an explanation of these phenomena, though the mode of attraction is not less obscure than the phenomena it explains, and the very idea of action at a distance may be abandoned as a misleading fiction. Following a course of this kind, one experimenter after another has attempted to find laws for the behavior of the electric current in the arc similar to those which it obeys in a metallic conductor.

Electricity flowing through a metallic conductor generates heat at a rate proportional to the square of the current, and the independence of that coefficient, which is called the resistance, of the amount of current passing, is so conspicuous a property of metals and their alloys that it seems to indicate some marked characteristic in the mechanism of their conduction. So when a current of electricity flows through a junction of two different metals heat is developed, or absorbed, at a rate directly proportional to the current, and here again the coefficient involved, viz., the electromotive force of contact, is a physical constant not less significant than the resistance. The molecular structure of metals is unaltered by the passage of the current, and no transfer of matter takes place.

This last property clearly differentiates the mode of conduction by metallic conductors from that by the arc, where disruption and transfer of matter occur. The *prima facie* improbability is very great that conduction by the arc is regulated by laws similar to the peculiarly exact and simple ones which

apply to metallic conductors. All attempts to represent the heat developed in the arc as due to a resistance and a back EMF.—or, in other words, to express it as the sum of two terms containing the first and second powers of the current respectively—have been futile, and it appears unwise to persist in attacking the question on these or similar lines.

If the arc consists of molecules torn from the positive carbon, employed in the incessant to and fro bombardment of the poles, carrying positive charges to the negative and negative charges to the positive carbon, the mode of transference of the charges is by convection and not by conduction; and an attempt to represent the action in terms of the ideas used for metallic conduction is analogous to an attempt to enter the statistics of a town supply by water carts on printed forms arranged for the data of a pipe supply.

An observation that under certain circumstances an increase of current in the arc is accompanied by a diminished potential difference between the carbons, led the observer, drawing too closely the analogies with metallic conduction, to the absurd conclusion that the arc possesses negative resistance. No portion of the heat generated in the arc has been traced to a distinct cause involving transformation of energy proportional to the square of the current; and we have no ground for assigning resistance to the arc.

Prof. Fleming, in a letter to the *Electrician* of January 7, considers the probability of the existence of a "counter electromotive force in the arc," and makes an interesting suggestion as to its possible source. It is not quite clear what idea is expressed by the words "counter electromotive force." They must mean something more than a means whereby electrical energy is converted into heat in direct proportion to the current, and seem to imply that the action is reversible, and to some extent elastic, so as to produce an EMF. in the reverse sense, if only for a very short time, on the sudden cessation of the main current. Such an action has been looked for repeatedly in the arc, but never, we believe, detected. It occurs in every other case we can call to mind, to which the term "counter electromotive force" is applied. It is not obvious why it should be looked for in the arc at all. An elastic action implies a return from a more to a less strained condition, and if the energy in the arc is employed in the disruption and mutual bombardment of the carbons, no reversible effect is to be expected.

Prof. Fleming suggests that the current may generate heat in direct proportion to its amount when passing from a hot point to a cooler one in carbon vapor, by analogy with the Thomson effect in copper, or solid carbon; the existence of a difference of temperature in the carbon vapor being inferred from the difference of temperature in the carbon rods at the arc. The explanation requires carbon vapor and solid carbon to be in contact at two very different temperatures at the same pressure, and to have very different thermo-electric gradients; since if the gradients were the same, the total development of heat, by a Thomson effect, between the distant ends of the carbons, which are at the same temperature, would be zero. The latter condition may be satisfied: we have no knowledge of the matter; but it is hard to see how two very different temperatures can be found in a small body of vapor, presumably saturated. The existence in hot gases of an effect similar to the Thomson effect in solid conductors is only guessed at, but it offers an interesting subject for experiment. If this effect is found in carbon vapor, electromotive forces between the solid and gaseous carbon might exist at the contact surfaces, similar to the Peltier effect in metals, and the energy converted at those points might be expected, by analogy, to be considerably greater than that due to a difference in the thermo-electric gradients in the solid carbon, and in its vapor.

It may be observed here that the reduction in the potential difference of the carbons for a given cur-

rent, by heating the negative carbon, is explained by the bombardment hypothesis, as well as by Prof. Fleming's.

Observations on the distribution of potential in the arc are difficult to interpret, but it appears that the difference of potential between the central part of the arc and the negative carbon is small or zero, and that the whole fall of potential in the arc takes place at or near the positive crater. At this point disruption of matter is taking place, and the generation of heat under these conditions and the generation of heat by a Peltier or Thomson effect, where no change occurs in the condition of the matter concerned, seem phenomena, *prima facie*, to be placed in very different categories. It would seem that little assistance in this question is to be expected from analogies drawn with the phenomena of electric conduction in solids. The phenomena seems rather allied to those of discharges in rarified gases and movements in electrolytic solutions.

Electric Lighting of Powder Magazines.

Acting on the instructions of the French Minister of War, a committee of the Académie des Sciences have drawn up a report on the precautions to be taken in fixing electrical conductors in or near powder magazines. The committee make no distinction between electric light and power conductors and telephone or telegraph wires, since all these may be exposed to lightning. The recommendations can be summarized as follows: All underground conductors for electricity, as well as gas and water pipes, should be kept at least 10 yards from the magazines. Aerial lines should be placed even further away—20 yards is recommended—and should be so arranged that they will not fall across the magazine in case of fracture. If light is required inside the magazine all wires are to be led in strong metal pipes, and then all switches and fuses, etc., controlling the lamps are to be placed outside the magazine. Only fixed lamps are permissible, and then they should be protected by a second envelope of glass. No voltages over 110 may be used. Any electric bells required in the magazines must be placed at least four yards from the powder, and the bells must be such as require very little current.

Changing Alternating to Direct Current.

Leo Graetz discusses an electro-chemical method of changing alternating into direct currents, his conclusions being given as follows: "An electrolytic cell, one of the electrodes of which is composed of aluminum, causes a great decrease in the strength of any current sent through it when the aluminum electrode is the anode, and the separation of oxygen takes place on it but leaves the current unaffected when the aluminum is the cathode. If through a series of such cells an alternating current is sent, and the number of cells is so chosen that the anode-polarization balances, or is greater than the tension of the current, the positive portion of the current, for which the aluminum would act as anode, is checked and only the negative current passes. On this principle, a method of converting an alternating current into a direct current is based."

Proposals Invited.

The War Department, through the United States Engineer at New London, Conn., is inviting sealed proposals until March 3, 1898, for electric lighting and power installation at Great Gull Island, New York. Specifications and full information regarding the work will be furnished prospective bidders upon application to Major Smith S. Leach, New London, Conn.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

THE CALCULATIONS OF THE ELECTRICAL RESISTANCES OF ALLOYS AND THEIR APPLICATION TO THE FINDING OF ALLOYS OF DEFINITE ELECTRICAL PROPERTIES.*

BY C. LIEBENOW.

It is not necessary to dwell here upon the importance of the properties of alloys as used in technics. The utility of alloys depends frequently upon their tensile strength, or luster, or permanency, or non-oxidation due to atmospheric causes, and frequently upon the numerical value of their electrical resistance and its independence from variations in temperature. Nevertheless their properties in general are very little known, and all our knowledge is derived only from observation in special cases. We can never be sure when compounding a new alloy whether it will differ decidedly from those investigated previously; a small increase of one of the constituents may result in a remarkable change in some of the properties. Even the measurements of the electrical resistance of supposedly identical alloys made by different observers have resulted in variations of as much as 50 per cent. or more, notwithstanding that the observers have exercised great care in the electrical and chemical determinations.

Even the question of the chemical nature of alloys has never been made clear as yet. In general we believe that alloys are either solutions of metals in each other or that they are really chemical combinations, a fact which has already been stated by Matthiessen in England forty years ago, who first investigated the electrical conductivity of alloys in a systematic manner. As to which of the alloys are real chemical compounds or simply mixtures there is considerable difference of opinion. Lately theories have been advanced upon the analyses of common liquid solutions to decide if a real metallic compound is built in the molten alloy. If however these conclusions do allow different explanations I do not wish to investigate them here. In any case we do not know if chemical compounds built in the molten state will not decompose again in the moment of solidification. If therefore we have made an alloy in the desired percentage proportion how can we decide whether we have a chemical compound or physical mixture of the constituents? If we wish to learn the chemical nature of solid alloys we must have a method of testing them in the solid condition without dissolving them.

Of all the properties which appear mostly changed in alloys from the properties of pure metals the electrical conductivity is the most striking. Feussner, for instance, found the resistance of certain nickel alloys not only to be five times as large as that of nickel and about thirty times as large as that of copper, but he also found the temperature coefficient of these alloys very materially different from those of its constituents.

The temperature coefficient of all pure metals, as is well known, is always positive and relatively high, about the same as we find the coefficient of expansion of gases. But in these alloys the temperature coefficient was partly nil and partly even negative.

Are we forced under such circumstances to assume a chemical combination of the metals with entirely new properties?

Matthiessen, who had already found similar results, did not yield to this opinion, but when asked how such large variations could result, he answered with the counter question, Are not all the other physical properties changed?

This of course means simply an extension of the question, but in placing it in parallel with the other one inspires some hope that as soon as we find the reason for one of these changes we will also acquire a better understanding of the other ones.

In order to be able to follow up the increase of

electrical resistance of alloys by calculation, it is necessary to adopt some theory about the constitution of the metals. We do not need to look about for this, but may select the well-known molecular hypothesis on which the science of modern chemistry is built up. According to this, all bodies are composed of small particles which cannot be further divided without destroying the properties of the body and which are known as molecules. The molecules again consist of still smaller particles, called atoms, which are themselves not further divisible.

I assume the same hypothesis for the solid metals, and this hypothesis is sufficient, as we will soon see with the help of some well-known empirical deductions—to permit an algebraical expression—for the increase of resistance. In case of melting two metals together the molecules remain unchanged; we have simply a physical mixture. In case, however, the metals exchange their atoms in melting them together, we would have new and other molecules than we had before melting the metals together, and we therefore would have a chemical combination of the metals; or in other words, when we call a metal a simple metal whose molecules consist of the one kind of atoms, in this case where each molecule consists of atoms of different kinds we would call the alloy a compounded metal.

We will consider first the simple alloys, which consist only of molecules of similar atoms, and we will choose as an example a gold-silver alloy. In this case we have throughout the whole alloy gold and silver molecules mixed thoroughly with each other. If we send through a wire consisting of such an alloy an electric current, and if we follow up a single thread of current within this wire, this current would pass alternately gold and silver molecules. If we consider the passage of such a current thread out of the wire, then we would obtain a thread which is composed of two metals alternately. If we were able, for example, to heat up every even contact point by a flame and could cool down every odd contact point, say by applying a very small piece of ice, there is no doubt that such a thread would generate an electric current exactly like a thermopile. This experiment cannot be performed, but we can make use of another way to accomplish the same effect. If we send an electric current through such a thread, the well-known Peltier effect will take place—i. e., the current will generate heat by going over from the one metal to the other and absorb heat in returning. Therefore the passing current increases the temperature, we will say, of all the even contact points and decreases the temperature in all the odd contact points. By this the current is generating an electromotive force, and it can be easily shown that this thermo-electric force must be always in opposite direction to the EMF, which causes the current itself to pass.

The electric current then generates in every second on the even contact points a definite quantity of heat and absorbs nearly an even quantity of heat on the odd contact points. In case our thermopile is well insulated against radiation, the temperature difference between two consecutive contact points must in the beginning continually increase. As, however, metals are conducting the heat, the heat will flow from the warm contact places to the cold ones through the metal itself. The quantity of heat going over in units of time will constantly increase as the temperature difference increases, till finally in every second just as much heat is conducted off as is generated. Then a stationary condition has been reached at which the temperature differences remain constant and a constant EMF. of the pile has been reached.

I would not like to tell you to develop mathematically the details of this theory. Whoever is interested in it will find the same in my paper, "Ueber den Elektrischen Widerstand der Metalle," which is published in the *Zeitschrift für Elektrochemie*, and which is also edited in book form.

This thermo-electric force which is generated in the pile from the moment when a stationary condition has been reached can be expressed by the following equation:

$$\pi = \frac{1}{n} \times \frac{l}{1-n} \times \frac{a_1}{a_2} \times i.$$

In this equation π designates the EMF., l the length, and q the cross section of the pile; i designates the current strength, and a_1 and a_2 are constants which depend upon the thermo-electric behavior of the molecules and their internal heat conductivity, and n and $1-n$ are the quantities of the alloyed metals expressed in parts of the total volume.

The first fraction on the right hand of this equation is therefore a constant for the particular alloy. If we designate this constant by c our equation reads

$$\pi = c \frac{l}{q} \times i.$$

You will be aware that we have here an expression of Ohm's Law— c corresponding to the specific resistance.

This equation holds good, as already stated, from the moment a stationary condition has been reached. The calculation furthermore shows that this condition will have been reached so much the quicker the shorter the single elements are; and the rate of decrease in time is greater than the corresponding decrease in length of elements. If the length of the elements are commensurable by the same units as the molecules, which means about one millionth of a millimeter, a rough calculation shows that already within a millionth of a second after the current is passing the deviation from the definite stationary condition would be so small that it is impossible to express it in per cent. If we would express it as a decimal, we would have to write down more than a thousand ciphers before the first numeral. The apparent resistance therefore is reached so quickly that there is no way of detecting any deviation in the first moment even with the most sensitive measuring instruments. And even if not, the self-induction in the pile would depress in the first moment the current impulse.

If we could, therefore, build a thermopile out of such small elements, and if the metals of which this pile consists would have no absolute resistance whatever, the pile would nevertheless show an apparent electrical resistance on account of the thermo-electric force, and this apparent resistance we would not be able to differentiate from a common electrical resistance of metals.

Our wire must certainly consist of a number of threads of such thermopiles, it seems to me therefore perfectly reasonable if I assume that there exists in the alloys besides the common resistance another apparent resistance of the form as expressed in the above equation.

I may here mention that I believe that the reason for an electrical resistance in pure metals in which no heterogeneous molecules are contained is due to a similar cause, "the Thomson phenomena."

If we now simply consider the alloys, we will be able to test our hypothesis, for example, by Matthiessen's observations.

Matthiessen divides the metals into two classes. To the first class, A, belong those metals which conduct the electrical current proportionally to their volume. To this class of metals belong lead, zinc, tin and cadmium. To the class B belong those metals which when alloyed with each other or with metals of class A will always conduct the electrical current in a lower degree than indicated by their proportions. To this class probably all other metals belong.

(To be continued.)

*Paper read before the Elektrotechnischen Verein on Nov. 28, 1897. (Translated for ELECTRICITY.)

PHYSICAL AND CHEMICAL PROPERTIES OF VOLATILE OILS IN BOILERS.*

BY W. H. EDGAR.

I have not written a paper, but will speak on the subject of the use of volatile oils, hydrocarbon, kerosene and oils of that nature, in the steam boiler. I do not believe there are many cases in this country where we get petroleum or other oils in our feed-water supply, but the general laws of nature are such that our waters are heavily impregnated with lime and magnesia, which are the main ingredients, the scale-forming salts, that form an incrustation in the steam boiler, which incrustation is a poor conductor of heat as compared with iron, so that we are forced to look around for something to counteract the evil effects of this incrustation and to get rid of it if possible; so that has led us to put most everything into our steam boilers, and among the different reagents employed have been volatile oils. I know that they have pumped turpentine and resinous oils into boilers up in the lumber districts, because they found in districts where they were sawing hemlock and oak that the sap and washings from them have apparently kept the boilers clean, so thought if they put a little of the product they were working on into their boilers it would have the same effect, it all being vegetable. These volatile oils, including turpentine and oils of that nature, are all hydrocarbons, and when they have been put into steam boilers have caused a corrosion or general eating and deleterious effects upon the boilers from their use.

In the oil fields years ago they put in what was called an oil brick, made from petroleum, and that was not successful; lately, in the last few years, they have been in the habit of pumping into the steam boilers kerosene, etc. I know of one party in Chicago who is at the head of some six or eight large plants, one of the largest corporations we have in the city of Chicago, who put naphtha gasoline into his boilers for years, and would persist in saying that it did the work to perfection, but had to stop using it, due to the leaks, etc.

There are two ways of looking at this subject of incrustation and its proper antidotal reagents. A boiler is very much like the human system; we are liable to injure it and we are liable to put something into it where the after effects are worse than the disease; so we must take up both sides of the question. Now, I want to bring out a few points about volatile oils and kerosene. Kerosene is a light distillate hydrocarbon and has been used very extensively throughout the country, or tried here and there, and dropped for one and another reason, and I will offer these suggestions and take up these points without any personal motive whatever, for I have none, but I will just simply take up the evil effects of kerosene and petroleum and their different distillates. Kerosene pumped into the steam boiler with the object of converting the incrustation into such form that we can readily wash it out, or prevent its formation, I will consider in the first place. Kerosene is a hydrocarbon. If we had a carbon hydrate, an animal oil, we would get an oleate radical and could possibly get the oleate of lime or oleate of magnesia, which however would not help us out, but we could get a chemical reaction from carbon hydrate having a combining acid radical there; but in the hydrocarbons we have no possible acid radical; we have not the base; we have not the combination that will take the place of either base or an acid radical and we get no chemical reaction whatever, and the action of the kerosene is purely mechanical, following the laws of capillary attraction. If I dip a blotter into water, the water will run up the side and penetrate the blotter; if the blotter is set over a tumbler of water, the water will penetrate through the substance of the blotter; and if you play a hose on a brick wall the moisture will penetrate to the other

side. Now, kerosene, being a light volatile oil, will penetrate everything of a porous nature such as lime, magnesia, etc., and will penetrate to a greater extent and more rapidly than water. The scale incrustation in the boiler will be softened, will be penetrated by this kerosene, due to the laws of capillary attraction; the scale being porous, the kerosene will work through to the iron, and when it comes in contact with hot metal the oil will run back of the sheet of the scale between the scale incrustation and the iron, and when you shut your boilers and draw your fires and let out your water, your boiler contracts, the iron contracting and expanding with the application of heat. Now, you have put a substance of different physical properties, of a different nature, between your lime and magnesia incrustation and your iron sheet or plate. The lime and magnesia, little particles of them, will attach themselves to the sheet, due to the general affinity that they have for hot metal; they cling very tenaciously to the iron, and when this substance comes in between, you have lessened that adhesive property and the incrustation is not adhering as tenaciously, and consequently, being a non-conductor and not expanding and contracting uniformly with the iron, it is more readily scaled off, and you get a great quantity of this broken scale from the continued use of a volatile oil such as kerosene. The kerosene does not change the chemical composition of the scale; its action is purely mechanical.

Now, there are other points to be looked at. Kerosene volatilizes in the steam boiler; you get probably a third over with your steam; it passes off immediately and begins to come over from about 150 degrees to 300 degrees Fahrenheit. (I was going to bring a little retort and a receiver up here, but thought it would be in the way and we would not be able to set it up.) This kerosene that passes over constitutes hydrocarbon distillate and your steam is hydrogen and oxygen, and you know the evil effects from condensation in a steam plant; you know that every year you have in your heating system to put in a few more nipples or an elbow here and there. When you put in a light volatile oil of a hydrocarbon nature you intensify that action and you get a series of oxidizing hydrocarbon reagents that will intensify that general pitting and grooving 10 per cent.; that is, you will get the general eating through of the joints and connections probably a hundred times as quick as you would otherwise. Besides that, the kerosene carries over into your cylinders. It is a part of the cylinder oil in the first place; they all come from the petroleum, except the animal oils. The kerosene is a solvent for them. It dilutes your cylinder oil; it has a tendency to change its lubricating properties just that much, and with the hydrogen and oxygen of the water and the compound formed in the distillate, you will get blackening of your piston rods and the deleterious general oxidizing effect on your rings, and if you have a metallic packing you will have hard work keeping your packing in your engine. From these same distillates, these same products formed in your distillation, you will have the pitting and the general eating through of all the threads of your joints and connections, through your entire steam system; not only that, but the part that is left in the steam boiler and the part that goes through your scale and reaches the iron cannot stand that high heat. It is carbonized. It is all decomposed, and in the carbonizing of the hydrocarbon oil in the presence of iron or against the iron sheet you are going to carbonize your iron, and you will have a blistered appearing spot where the iron has been carbonized; it will be of a blackish, blistered appearance, and you will get that action all through the water submerged part of your boilers. You will never get all your scale out with kerosene; you will never get more than a third, and those who are using kerosene and claim it is working fine simply look at the scale that they take out and do not look into the boiler to see what is left. In my travels I have had some of my

best friends tell me that they have used kerosene and their boilers are clean, their system is in good shape, and I have gone down to their plants and looked around, and in the steam system from the boilers to the engine I have seen the little leaks; and when this leakage does start in and the flange gives out and you have to put a new one in, in taking that apart you jar the whole system and bring to sight more leaks where your piping is half eaten through and almost ready to leak. Of course an old plant will show up leaks in a few months or a year, but a brand new plant will disclose leaks in time if you continually use kerosene.

Now, why do people want to use kerosene? It is generally the man up at the office end of the institution that clings to the practice; it is generally the superintendent or the manager that clings to kerosene, because it costs nothing; he is getting something for nothing. That is where so many men have made a mistake even in the running of large enterprises and large businesses. One of the greatest dangers is to look for something for nothing. Even in the hiring of men to represent them and in the hiring of help—in the hiring of brains around their establishment—they are not willing to pay; they want ten dollars put in their hands before they will give eight dollars. A man cannot do that in business; you cannot get something for nothing and you cannot get any man to run his business without profit. This is true of boiler compounds, which to the modern steam plant owner is far behind all other branches of science. If you will in using kerosene, or using any volatile oil of that nature whatever, take the subject up and look into it for yourselves, you will find that the deleterious effects, the general carbonizing and pitting, the general eating away of that thin natural skin of the iron (the finish as it comes from the boiler maker) is a dangerous thing. It takes several years to scale a boiler to start with, on a fairly good water, but if it is scaled once it will scale again in three months, because the skin of the iron is gone. When the skin of the iron is once gone, the scaling ingredients readily attach themselves to the rougher iron, while in the new boiler they cannot adhere as rapidly as they can in the boiler where the skin is gone.

Mr. Thayer—I would like to inquire what the chemical reactions are that occur between the pure water and the iron, and also between the mixture of pure water and the hydrocarbon oil and the iron. There has been a great deal of trouble in exhaust steam where the condensed water was absolutely pure and a strong corrosive action on the iron being found which is stronger at the pressure of 212 degrees than it is with the high pressure steam. The New York Steam District Company in their steam mains had them originally laid with return pipes, and they found that their returns were so badly corroded that they had to waste all the water of condensation instead of returning it to the boiler.

Mr. Edgar—It is purely an oxidation with the aid of hydrogen. We get the same effect there as we would get in a boiler where you are using the water over and over again and the water is too pure, or you are pumping rain water and distilled water back into your boilers and you get a pitting same as the submerged part of the boiler; you get a pitting and grooving of the iron; and in these pits which have a scab over a great many of them or the appearance of a scab, if you tap that off you will find underneath a little raw sore, you might say a hole, eating through the skin of the iron, a pit-hole, and in that hole you will find a red powder and this powder is the ferric hydrate. You get the same thing by taking tincture of chloride of iron and adding ammonia water precipitating ferric hydrate, which is $\text{Fe}(\text{OH})_3$, and by boiling the same as we would boil it in the pharmaceutical laboratory it is converted into its oxides, finally going into black magnetic oxide of iron, which is a black gritty powder having the physical properties of the black manganese dioxide, and is found in the bottom of the boiler. In

* Address before the Northwestern Electrical Association, Milwaukee, Wis., January 19-21, 1898.

FEB. 9, 1898.]

this deleterious action on the piping from the distilled water you have a water which is not satisfied. You know water is the greatest solvent known to chemistry. We have no artificial liquid or anything produced by nature that is so great a general solvent as water. It must take up something in solution to keep it satisfied. It has got to be satisfied. It is as natural for water to want to take up something in solution as it is for a woman to want a baby. It is natural for water to want to take up something and take care of it and hold it in solution. All nature is governed alike. We are all subject to magnetic attractions, electrical currents, absence of heat, chemical affinities and natural laws, and we find the same thing in chemistry—each element has its given affinity and its natural influence over nature.

Mr. Thayer—The water acts on the iron and produces ferric hydrate with the liberation of half the hydrogen, is that it?

Mr. Edgar—Yes, we get direct oxidation by the way of a hydrate. Also we often pump our fresh water into the heater and get pitting in the heater and not in the boiler, which is due to lack of circulation and the freeing of the air and oxygen held in the water, and it is almost a direct oxidation in that case. But we get a more rapid oxidation in the presence of the H_2O pure. It is in an unsatisfied condition, and our iron is taken up as a hydrate from that to an oxide; that is, from our analysis and personal investigations we find that we have got to satisfy the water.

If you could in some way get into the condensing system, that is, into the steam system where the condensation begins to take place, and introduce something to satisfy that water, you would stop that trouble, but I do not believe you can do that. There is no way of really reaching that.

Mr. Thayer—Hot water, then, containing the carbonate and sulphate of lime and magnesia will not exert that action except in a modified degree?

Mr. Edgar—Yes.

Mr. Ralph—What is your idea in regard to the vegetable compounds?

Mr. Edgar—Speaking of vegetable compounds, we should use sugars and tannins only, and in the following way: We find that we can take care of the carbonates of lime and magnesia with tannin extracts, and this is what we want; we do not want the extracted tannic acid.

Mr. Ralph—Well, the tannin is what these lumbermen were getting when they were getting it out of their oak and different lumbars, but when they got into the pine forest they got a resinous gum as I understand it?

Mr. Edgar—Yes, sir. We want the tannin in the extract form and still combined and containing the inert matter—the sap, the sugar and the starch. We want that because we do not want the straight, pure tannic acid. It is too stable in itself to be readily convertible into tannates. Our object is to convert carbonates of lime and magnesia into tannates. Now we find that we cannot work on gypsum, the sulphate of lime, with tannin. We find that gypsum is one of the four insoluble sulphates and that it is so stable in itself that it is not even soluble in its own acid, and is soluble only in the analytical laboratory in small quantities in hydrochloric acid.

Mr. Thayer—Have you worked on the magnesium sulphates too?

Mr. Edgar—Yes. Now we find that sugar introduced into the steam boiler with the water will convert the sulphates into saccharates. The saccharates break up into oxalates, tartrates and carbonates, and in the presence of tannin extracts part of that goes into tannate of lime, so that we need but a small proportion of sugar present in the general mixture to handle a water containing both the sulphates and the carbonates. Your sulphates and carbonates are to be proportioned according to the percentage of the carbonate and sulphate contained in the water, determined by analysis.

Mr. Ralph—You spoke about introducing the compound into the steam boiler or condenser. Do you not think that would be a good way to neutralize the effect of the water, if possible, before it went into the boiler?

Mr. Edgar—Yes, indeed. Take it back as far as you can take it through the system. The tannins in the extracted form and blended with the sugar give you no tannic acid reaction or action on the metals. You have got your readily converted tannins and they will take up lime and magnesia only, and under the conditions it is impossible to get any effect on the iron or metal. It also has no effect whatever on the gaskets or any of the substances of an organic nature in your packing. Using a vegetable mixture of that kind you will keep your gaskets pliable. You will keep all your connections and your boiler plant intact, with never a leak, and you can keep your boilers absolutely clean, and you can go to the wholesale druggist and buy the materials yourself; and it is well always to mix in a little slippery elm and poke root or powdered willow hardwood pulp so as to get a little soluble wood starch to keep your sugars from being too stable and the tannins likewise, so as to get readily convertible tannates and saccharates. We should not have a thing too well satisfied—we cannot change it, the actions are not there—we are in the realm of organic chemistry where the combinations are very complex. We get a reaction a great many times in chemistry which is not true to our general text books; that is to say, there is many a chemist who has determined something in his laboratory and completed a reaction, and he has formed a company to exploit his new method of making white lead, for instance, at one-quarter the price at which it has been hitherto produced. He goes right on with his work; he is perfectly sincere and confident. A big factory is put up, machinery is started and everything is set going, but the results do not come. The chemist then changes everything and perhaps puts in some electrodes with a little current for the purpose of excitation, but all fails, and many a fortune has been lost on such laboratory results. On the other hand, there are a hundred and one things that take place in our manufacturing establishments on a large scale, produced by nature, that we cannot reproduce in the analytical laboratory.

Mr. Norcross—You do not recommend, as I understand it, the use of kerosene oil to remove scale in boilers?

Mr. Edgar—No, sir; under no circumstances should kerosene oil be put in the boiler. I would make the same remark in regard to caustic soda.

Mr. Norcross—Your suggestion in regard to the skin on the iron is important.

Mr. Edgar—I would advise you to get a tube that is all scaled over and seal it up at the bottom of an iron kettle and play your flame up in the middle of it, then put your kerosene and water in there and watch the action.

In answer regarding steam heaters: I think one of these steam heaters is a good thing on hard water, for you get from 50 to 70 per cent. out. If a water is so soft that you get all the impurities out it becomes too pure and you pit your boilers. Water is a great solvent. In the East, where the soil is principally granitic, there is very little scale, only about two or three grains to the gallon; but throughout the West, where there is a limestone soil, you get from 16 to 40 grains.

A surface blow-off contrivance is very good, but the trouble is they are expected to do all the work, and sufficient interest and care is not usually taken in the application of such contrivances. The boiler is too often neglected and it cannot get up and speak its piece like the engine when anything is wrong.

You must diagnose your case and work out your own ideas.

Do not forget to treat the boiler regularly. Put in regularly whatever you use. Have the water analyzed and go to the wholesale druggist and he can

mix up the tannins and sugars in proper proportions; but do not use any soda. Some sulphate waters require considerable starch, slippery elm, etc.; they sometimes use 5 or 6 per cent. of carbonate soda in boiling together, which kills the gelatinous properties, and then when you introduce your tannin extract the carbonate is converted into tannate of soda—5 per cent. tannate of soda, 20 per cent. of sugar and 50 per cent. of tannins.

The steam users in the country should look into this thing and should study their boilers. There is an article on the impropriety of the use of caustic soda in the October issue of the *National Engineer*, also one on "Water" in the December issue. The greatest point in regard to compounds is the care given to the boiler. We should get the engineer interested in the matter.

SHIELDED CONDUCTORS.*

BY W. A. PRICE.

Mr. Mordey's paper on "Dynamos," read on May 20th, before the Institution of Electrical Engineers, has produced a long series of articles and letters in different periodicals, proposing and solving a number of paradoxes and puzzles of more than usual interest. Some of these are curious and excellent examples of magnetic problems that can be dealt with sufficiently by the application of first principles though complete solutions would be difficult mathematical exercises. The first puzzle proposed was not new, having been described years ago by Mr. James Swinburne; but its interest was revived by an experiment described by Mr. Mordey. The difficulty is to explain how a conductor buried in the iron of a slot-wound armature experiences very little mechanical force, though it is equally as efficient in developing electromotive force in a dynamo as if it

FIG. 1.

were exposed on the surface of an ordinary drum armature, and has just the same effect in producing torque in a motor.

The electromotive force developed in a conductor is simply proportional to the number of lines of force crossing it in a given time. The mechanical force on a conductor is proportional to the product of the current, and the density of the magnetic field in its own substance; and the difficulty lies in seeing how the magnetic field in the body of the slot-wound conductor can be so small that no appreciable force is exercised on the conductor, while, at the same time, it is cutting a field of sufficient intensity to generate a large electromotive force. The answer is, of course, that in a slot-wound armature the conductors are so shielded by the iron body in which the slots are cut that only a very small part of the total magnetic flux passes through them at any given instant, and the force acting on the conductor is correspondingly small; while at the same time the total flux cut by any conductor in the course of the revolution of the armature is not affected.

Figs. 1 and 2 are diagrams of the usual character, showing the distribution of the lines of magnetic flux near the air-gap in a slot-wound armature. The upper part in each figure represents parts of a magnet pole, while the conductors are shown in round slots cut in the body of the armature. The air-gap

*From the *Electrical Review*, London.

is shown straight instead of an arc of a circle for convenience in drawing. Fig. 1 gives the arrangement of the lines of magnetic flux when there is no current in the conductor. The field in the body of the conductor is extremely weak, but as the armature is rotated the lines of flux are carried across the conductor, moving slowly in the mass of the iron, but flashing across the slot at great speed. But no figure explains the movement as well as Mr. Swinburne's comparison of the action to the appearance of a row of railings passing behind a knot in the window of a railway carriage, producing an appearance similar to Fig. 1.

Fig. 2 gives the arrangement of the lines when a

Fig. 2.

current is passing in the conductor. It is obtained by imposing on Fig. 1 a system of magnetic forces, circular about the conductors, producing distortion of the field. The distortion does not affect the reasoning already given about the forces acting on the conductors, and the electromotive forces developed; but the figure shows how it is that the weakness of the field in the body of the conductor does not affect the torque on the armature. The points of application of the forces which produce the torque lie on the surface of the armature, where the lines of force enter it from the ether, viz., along the surface, A A A. In Fig. 1 these lines enter the surface normally, and produce no torque; but when a current is started in the conductors, the lines of force in the air-gap become slightly oblique, as shown in Fig. 2, in consequence of the circular systems of magnetic forces about the conductors, and a torque is developed. The whole of the useful effect is obtained from the slight displacement in the air-gap. The large displacement of the lines in the body of the armature serves no useful purpose. The magnetic force in

Fig. 3.

the air-gap, due to the current in the conductor of circular section, is at all points inversely proportional to the distance from the axis of the conductor, and is in no way shielded by the iron body of the armature.

Another advantage possessed by slot-wound conductors, that they are less heated by eddy currents than surface conductors, can only be due to a very steady movement of the lines of flux across the slots, so that all parts of any conductor are cutting lines at the same rate. It is no explanation to say that,

since the field in which the conductor lies is weak, even large percentage variations in its density are immaterial; for the absolute density has no relation to the generated electromotive force. The exact explanation of what is undoubtedly the fact, viz., the freedom of slot-wound conductors from eddy current heating, is not very clear.

A remarkable statement has been made by Prof. du Bois, from whose article in the *Elektrotechnische Zeitschrift* we extract the following passage:

"A ring magnet experiences a side thrust when in an external field, whose lines of force are in the same plane as the ring; and conversely it exerts a thrust in the opposite direction upon the supporter of the external field. This deduction, so astonishing at first sight, I have proved to be verified by experiment."

Though not expressly stated, it seems to be implied that the field is uniform, except so far as the ring distorts it, the ring homogeneous and uniformly magnetized, and the thrust experienced a continuous one, and not merely impulsive or ballistic on completing the connections. We take "side thrust" to mean a thrust in the plane of the ring, at right angles with the field, but it may mean a thrust in the direction of the axis of the ring. Each construction presents the same difficulties. Such a field and ring may be realized by permanent magnets, and by

Fig. 4.

arranging the ring to turn about an axis "perpetual motion" is obtained.

Mr. James Russell disputes the truth of this "deduction" on experimental evidence, while it is totally opposed to conclusions drawn from the ordinary premises, which would lead us to reason somewhat thus. If an iron or steel anchor ring, unmagnetized, be introduced into a uniform magnet field, the field is distorted from its previous form in some way depending on the permeability of the ring and its position in the field. If the ring is placed with its plane parallel to the field, it will experience no force tending to move it in space. There will be forces tending to elongate it into an oval, but these would not produce any such effect as that discovered by Prof. du Bois. Now, without moving it, suppose the ring to become circularly magnetized. This magnetization, though it produces a new distortion of the field in the body of the ring, produces none in the field outside the ring, which retains the same form and distribution as before, so that the ring experiences no force.

Figs. 3 and 4 show the character of the field near the ring before and after its magnetization.

In these diagrams we have taken no account of the effect on the permeability of the different flux densities on the two sides of the ring. This would change the field distribution to a form that would be produced by an unmagnetized ring which is non-homogeneous, but symmetrical about the axis A B of Fig. 3, being less permeable on the side B than on the side A. This change of field taking place when the ring is magnetized would produce a sud-

den and transient force acting on the ring in the direction B—A, and it is possible that this is the effect Prof. du Bois has observed. His words do not exclude such a construction. The action would not occur with a circular or ring solenoid.

Mr. Mordey's suggested explanation of Prof. du Bois' observation published in the *Phil. Mag.* for

Fig. 5.

December is difficult to understand. He attributes it to the fact that a ring solenoid is equivalent magnetically, so far as the external field is concerned, to a single turn laid along the circle that forms the axis of the helix, but how such a ring can experience a side thrust in a magnetic field is not easy to see. One would expect only a tendency to turn into a plane perpendicular to the field.

Mr. James Russell describes also a number of interesting experiments on the forces exerted on a conductor carrying current in a magnetic field, when shielded by an iron cylinder. In one of these an iron tube is placed in a uniform magnetic field perpendicular to the tube, and a conductor is placed in the axis of the tube. On starting a current in the conductor, the iron shield tends to move sideways, i. e., at right angles to the field and to its own length, while the conductor experiences little or no force. Considered in connection with the action on the magnetized ring (Fig. 4), the result seems paradoxical, i. e., if this action be what we suppose, and Prof. du Bois is mistaken; for the effect

Fig. 6.

of the current on the iron tube is to magnetize it circularly, and to produce motion sideways, while no such motion occurs with a permanent ring magnet of the same form.

The explanation lies in the action of the current on the field outside of the iron tube, which is distorted by the current exactly as if the iron shield were absent, and is not affected by the circular distribution in the ring itself. In fact though the iron tube shields the conductor inside it from the action of the outside field, and prevents any force from acting on it, it does not shield the outside field from

the action of the current in the conductor. It seems possible that Prof. du Bois, in his experiment on the magnetized ring, may have led his current in such a way as to distort the field, and so produce the action on the ring, an action which would be more intense if the ring were not permanently magnetized and more permeable.

Fig. 5 shows the character of the distribution of the field when no current is passing in the conductor. It is, of course, similar to Fig. 3. Fig. 6 shows the field when a current is passing, and the field is disturbed outside the shield, tending to move it in the direction of the arrow. Comparison of Figs. 4 and 6 shows the difference between the conditions of Mr. Russell's experiment and the one we understand Prof. du Bois to describe.

Another point requires notice. A law of refrangibility has been repeatedly referred to, viz., that the

FIG. 7.

ratio of the tangents of the angles made by a line of magnetic flux with the normals on two sides of a surface separating two different media is equal to the ratio of their permeabilities. This only applies when neither medium is coercive, and the field of magnetic force is continuous at the surface in question; e. g., suppose in diagram Fig. 7, A A, B B, are infinite plane current sheets, A A coming up, B B flowing down normally to the paper. The space between A A, B B, is a uniform magnetic field in the direction of the arrow. Now, if the whole be placed in a uniform field perpendicular to the sheets, the lines of flow will take the direction shown in the figure, each of them bending sharply where they cross the current sheets, though the whole space is equally permeable.

So where lines of flow enter hard magnetized steel the law does not apply, and since all iron is coercive and other materials have practically the same permeability, the law is little more than a guide in drawing freehand certain classes of diagrams.

It is not suggested that the writers who have re-

FIG. 8.

ferred to this law are not familiar with its limitations, but when laws are formally stated one is apt to think the statement is also complete.

I am tempted to suggest another paradox. A space is enclosed by a shield formed of bar magnets placed side by side with all their north poles outside and all their south poles inside. There can be no flux, and they consequently cease to be magnets.

For a simple case, consider the space enclosed between two infinite plane magnetic shells (Fig. 8). Along N N, N N, are north poles, and along S S, S S, south poles, the shells being made of small bar magnets placed side by side. There is no magnetic field anywhere. Have the bars ceased to be magnets?

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

LONDON NOTES.

[From our London Correspondent.]

Electric Mail Carts.

The Post Office authorities in London have been for some months past experimenting with steam, electric and other motor mail carts. A service of electrical delivery vans has now been inaugurated for carrying the mails between the General Post Office (St. Martins le Grand) and the West Central, Western and Paddington district offices. These vans were supplied by the London Electrical Cab Company, which has had a number of electrical cabs in service on the London streets for some time past and is now making arrangements for a greatly increased number to be in use.

Electric Lighting of the Thames Embankment.

The London County Council proposes to put down a special installation for the electric lighting of the Victoria Embankment and the Westminster Bridge, the annual maintenance cost of the plant being roughly estimated at \$17,600. The initial outlay will be \$126,500. Another cross-river in close proximity, the Waterloo, will be electrically lighted free of charge by a company in return for a concession to lay mains across.

Electric Lighting in London.

The London electricity supply companies seem to have reached very prosperous times. One company has declared dividends of 12 per cent. on its ordinary capital for the year 1897, and another 14½ per cent. These are the highest dividends ever paid in England for electricity supply, but there is promise of other London companies doing quite as well within a year or two. The City of London Electric Lighting Company, which supplies the City proper, has not yet declared its dividend, but it is rumored on the Exchange that the year's profits will be equal to 17½ per cent., though the dividend may not be more than 11 or 12 per cent. There is a good deal of dissatisfaction felt by this company's consumers at the high charges imposed notwithstanding the enormous business. The full charge of 8d. per Board of Trade unit is imposed for lighting, and all attempts to get it reduced have failed.

Lucan Tramways.

The Lucan Steam Tramways Company (Ireland) has for some time been considering the question of electric traction, and when recently the line was relaid for widening the gauge from 3 ft. to 3 ft. 6 in., advantage was taken of the opportunity to have the rails specially bonded ready for electric traction. The cost of equipping the lines for electrical working is estimated at about \$75,000 and the equipment can be done in four months.

Lecture on Electrical Engineering.

A series of lectures on electrical engineering has been arranged for to be given in the American Museum of Natural History, New York, during the month of February. The first of the series, on "Mechanical Sources of Energy," by Prof. Frederick R. Hutton, was delivered on Friday evening last and proved attractive to a quite numerous audience that would have been larger if the weather had been more favorable. The other lectures will be given in succession as follows: February 12, "Generation of Electrical Energy," by Prof. Francis R. Crocker; February 19, "Transmission of Electrical Energy," by Dr. A. E. Kennelly; February 26, "Utilization of Electrical Energy," by Prof. William A. Anthony.

The lectures begin at 8 o'clock on the evenings named. Tickets of admission are required, and these can be had without charge from the Secretary of Columbia University.

CANADIAN NOTES.

Application will be made to Dominion Parliament for an act to incorporate "The North Shore Electric Railway Company," to construct a railway on the north shore of the St. Lawrence, starting from Three Rivers in the province of Quebec, and through the district of Three Rivers and other districts in the province.

At the annual meeting of the shareholders of the Ottawa Electric Railway Company, last week, the annual report was submitted and considered satisfactory. It showed that 4,762,082 passengers were carried during the year, and 1,538,836 miles run, and that four quarterly dividends of 2 per cent. each were paid. A satisfactory increase in receipts was reported, especially since the month of September.

Rumors have been circulated respecting the approaching completion of arrangements whereby the street railway company of Montreal will obtain its power from the Chambly Power Company in future. Ever since the construction of the works of the Lachine Rapids Company and of the Chambly Company, the street railway people have been urged to substitute water for steam to operate their electric plant, it being represented that considerable economy in working expenses could thus be effected. The street railway people have been studying the question and are naturally prepared to make any bargain which can be advantageous to them, but so far no decision has been reached.

Application will be made to the Dominion Parliament at its present session for an act to incorporate a company to construct a railway to be operated by electricity or other power between London, Ont., and a point in or near the village of Lucan, and from Lucan to a point in or near Centralia in the township of Stephen, in the county of Huron, to a point in or near Grand Bend on Lake Huron; also with power to construct and operate telegraph and telephone lines, to take and use water for generating power, and to transmit and dispose of the power derived therefrom; to build, acquire and operate steam and other vessels and all necessary wharves and docks.

The Electrical Exhibition.—A Personal Exhibit by Prof. S. H. Short.

In addition to the superb exhibit which will be made of all its modern apparatus for the generation and use of electricity by the Walker Company of Cleveland, Prof. S. H. Short, its electrical engineer, well known as one of the most distinguished and successful pioneers in the electrical railway field, will make a personal exhibit. For some fifteen years Prof. Short has been actively engaged in railway design and invention, and as far back as 1885 organized a company in Denver which laid and operated a slotted conduit railway. His work will now be interestingly and richly illustrated by pictures, relics, models, old apparatus, etc. It will constitute one of the features of the Exhibition, and will attract wide attention and help secure for Prof. Short the recognition which certainly is his due.

Chicago Electrical Association.

The following papers are to be read before the above Association at Chicago on the evenings given: February 18—"Electricity in Medicine," by E. W. Jewell.

March 4—"Relationship of the Hunter and Tesla Patents," by A. Miller Belfield.

March 18—"The Autobiography of a Piece of Wire," by C. T. Gage.

April 15—"The Electric Railway," by W. R. Garton.

May 6—"The Enclosed Arc Lamp," by J. M. Hollister.

The annual banquet of the Association will be held on May 20.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

LEGAL NOTES.

The firm of Royce & Marean, electrical manufacturers, Washington, D. C., have been made defendants in a suit for injunction filed by the Diehl Manufacturing Company of New Jersey, which claims to have exclusive patent rights to certain improvements in electrical fans and appliances that Royce & Marean are manufacturing. The bill states that Edwin H. Bennett, Jr., a member of the Diehl Company, is the inventor of the improvements, and has transferred the patent rights to the company.

I. I. Spiro has been appointed receiver of the Lake Cities Electric Railroad Company of Michigan City. The receiver filed a bond in \$50,000 before assuming control of the road. The liabilities are estimated at \$30,000, with assets not known.

The General Electric Company has brought suit in the Circuit Court at Jacksonville, Fla., in which assumpsit damages for \$10,000 are claimed from the city in connection with the municipal lighting plant contract.

John L. Heins, president of the New Jersey Electric Railroad, commonly known as the Rutherford road, has been appointed receiver for that company, and the United States Court has served notice to the city authorities of Hoboken, N. J., restraining them from interfering with the operation of the road. The Hoboken officials had endeavored to compel the company to pay the \$20,000 which it had agreed to pay for its franchise by stopping the running of the cars on Sunday through the enforcement of an ancient "blue law," and the U. S. Court was appealed to by the company.

The full bench of the Supreme Court at Boston on the 27th ult. sustained the defendant's exceptions in the case of Carlos Wilson vs. Thomas W. Bicknel. The Boston *Transcript* gives the following statement of the matter in suit: "In accordance with an agreement entered into between the plaintiff and the defendant, the former on January 3, 1891, purchased of the latter 100 shares of stock of the International Port Electric Company of New York for \$1,000. By the terms of the agreement the defendant agreed to reimburse the plaintiff for any loss on the shares purchased by plaintiff on January 3, 1891, 'at or before the expiration of five years from this date, with interest at 6 per cent.' In September, 1895, the plaintiff offered the stock to the defendant, stating that it was worthless. The defendant refused to accept it. As a result the plaintiff brought suit against the defendant to recover \$1,000 with interest, in accordance with the agreement referred to. The Superior Court found for the plaintiff, and the defendant excepted and appealed. The Supreme Court declares that the action was prematurely brought, the five years not having expired. In the opinion written by Mr. Justice Lathrop, the Court says: 'A promise to pay a person "at or before" a day named is a promise to pay on the day named, the promisor having the option to pay before that time.'"

Death of William Habirshaw.

The death at Yonkers, N. Y., on the 30th ult., of Mr. William Habirshaw, only son of Dr. W. M. Habirshaw of the India Rubber & Gutta Percha Insulating Company, was a severe blow to his immediate family and to his business associates and its announcement was received with unfeigned sorrow by all his friends and acquaintances. His illness was of only a single week's duration, but his disease was pneumonia, and though combated by the best medical skill and the most devoted attendance, it gained the mastery and death resulted. The deceased was a young man of fine physique and engaging personality and had the reputation of being one of the best informed men in the wire insulation field and an expert in all laboratory work in that direction. His death, coming with such suddenness, is a deplorable affliction that must bear heavily upon his aged parents, and all who knew their son sincerely sympathize with them in their trouble.

Desirable Books.

Theo. Audel & Co. of 63 Fifth avenue, New York, the well known publishers, have recently brought out two exceedingly useful and valuable works.

One, entitled "The New Catechism of the Steam Engine," by Prof. W. Hawkins, treats of the steam engine and its appliances, and to this are added chapters on gas, gasoline and hot-air engines. "The New Catechism of Electricity," also by Prof. Hawkins, treats mainly of dynamo electric machines in a way that can readily be understood by anyone. Fully one-third part of the whole work has been devoted to the explanation and illustrations of the dynamo and particular directions relating to its care and management. All the directions are given in the simplest and most enticing way, to assist rather than confuse the learner.

As the price of these books is but \$2 each it will well repay any one interested in this subject to secure either one or both by addressing Theo. Audel & Co., 63 Fifth avenue, New York.

Personal.

All who are interested in the Electrical Exhibition—and that means the whole electrical trade—will be glad to learn that Mr. Max Osterberg has been retained by the Electrical Exhibition Company as Construction Engineer.

GENERAL NEWS.

What Is Going On in the Electrical World.

Chillicothe, O.—The plant and other property of the Chillicothe Electric Street Railway & Lighting Company have been transferred to a syndicate of local capitalists composed of William Poland, George A. Vaughners, Clark W. Story, Willard A. Story and John Tomlinson. The property is to be greatly improved.

Chicago.—The executive committee of the Illinois Street Railway Association at a recent meeting in Springfield instructed the secretary to request C. L. Bonney to prepare a paper embodying the views entertained by him relative to municipal franchises for street railways, to be read before the association at a meeting to be held in Chicago on the third Wednesday in May. Seventy-five of the 120 cars of the South Side Elevated Railroad have been already equipped with the new Sprague motors and the work is going forward at the rate of ten cars a week.

Cleveland, O.—President Emerson, of the city council, favors the organization in Cleveland of a bureau of electricity, to have charge of electric lights, telephone, telegraph, fire alarm and other wires.

Connersville, Ind.—The plant of the Connersville Gas & Electric Light Company has been purchased at foreclosure sale for \$8,000 by J. H. Sly, George Griffith and Thomas K. Egbert of New York. There is a bonded indebtedness of \$117,000 held by the Boston Loan & Trust Company.

Denver, Col.—The Denver City Railroad Company has applied to the city council for permission to change its system from the cable to the trolley.

Detroit, Mich.—The Detroit, Lake Shore & Mt. Clemens Railway Company has concluded negotiations for completing its line from Detroit to Mt. Clemens, Marine City and Algonac. The following officers have been elected: President Merrill B. Mills; vice-president, George S. Davis; secretary, Thos. N. Fordyce; treasurer, Frederick T. Ranney.

Fairmont, W. Va.—The Fairmont Electric Railway Company has been chartered and work on the road will begin at once. Col. A. Howard is the chief promoter.

Farmington, Ia.—At the city election held here a few days ago there were two propositions before the public: Shall the city of Farmington be permitted to put in electric lights or shall a company be permitted to put in a system of electric lights. The last proposition carried by a majority of 145.

Geneva, N. Y.—Justice Dunwell has appointed J. N. Johnston referee to sell the franchise and property of the Geneva Brush Electric Light & Power Company to satisfy a claim of the American Loan and Trust Company of New York.

Gridley, Ill.—There is an agitation here in favor of putting in electric lights and water works.

Grand Rapids, Mich.—The M. B. Wheeler Electric Company, located here, is to be organized into a stock company with increased capital.

Hazleton, Pa.—Surveyors have been staking out a route in the Conyngham Valley for an electric road to be run from this city to Wilkes-Barre. The project was conceived by Alvan Markle of Hazleton and by officers of the Wilkes-Barre & Wyoming Valley Railroad Company, but the greater part of the capital will, it is understood, be furnished by New York parties.

Kansas City, Mo.—The Tenth Street Cable Company has begun preparations to change its line from cable to electricity. When the change is made the line will be extended.

Kansas City, Kan.—Operations for the building of the Kansas City, Lawrence & Topeka Railway will be begun

at once and it is expected that the road will be completed to Lawrence before the end of the coming spring. Ex-Senator C. S. Brice is one of the financiers behind the scheme. The primary object of the railroad is to open the Kaw valley to a new cultivation and to change it from a continuous cornfield yielding annually from \$10 to \$20 per acre to a vegetable and fruit growing region which will return from \$200 to \$500 per acre per year. By means of the proposed road these products can be delivered into the Kansas City market in from fifteen to fifty minutes from the time they are gathered. By cutting the present immense tracts of land, some of them over 2,000 acres in extent, into five, ten and twenty acre tracts, it is expected that a great increase to the population of the Kaw valley will follow, and that it will become the greatest garden in the world. Apart from the details of operating the road, the company proposes to furnish electricity for manufacturing and lighting purposes to the cities and towns along the line. The work of securing the right-of-way is being vigorously pushed, and no difficulty is being experienced by the promoters in gaining concessions, because of the fact that the property holders are enthusiastically in favor of the new line.

La Porte, Ind.—Col. Sears of this city, representing a syndicate which proposes to build an electric railway from Goshen, Ind., to Danville, Ill., and to St. Louis, is going to London to interest English capital in the project.

Marquette, Mich.—After eight years of unsatisfactory municipal electric lighting and an expenditure of \$116,000, the light plant has at length been equipped with sufficient power to light the city.

Madison, Ill.—F. E. Allison, president of the Venice, Madison & Granite City Electric Railway, and E. J. Spencer have applied to the village board for a street railway franchise covering certain streets in Madison.

Middletown, Conn.—At a recent meeting of the directors of the Middletown Street Railway Company and of the Portland Street Railway Company it was voted to consolidate the two corporations, with \$135,000 capital stock, representing \$75,000 stock now outstanding of the Middletown Company, and \$60,000 outstanding stock of the Portland Company. J. M. Douglass of Middletown was elected president of the consolidated company, and Israel Kelsey of West Haven vice-president.

New Haven, Conn.—The Connecticut Electric Lighting Association elected the following officers at the annual meeting: President, James English of New Haven; treasurer, A. M. Young of Waterbury; secretary, Addison F. Hunie of New Haven.

New York.—Superintendent J. H. Robinson of the Third Avenue Railroad Company states that the main line of the road, the 125th street and Amsterdam avenue line and the branches will be equipped with electrical underground trolleys as soon as consents are obtained and the materials can be supplied.—Importers of electric light carbons, through R. F. Downing & Co., Custom House brokers, have filed a protest against the Appraiser's interpretation of the provision of the tariff law relating to imported carbon sticks. The law imposes a duty of 90 cents a hundred pieces, and importers have caused the pieces to be increased to about three times their original length for the purpose of lightening the duty, cutting them into the proper lengths after reaching this country. Appraiser Wakeman has deemed it to be his duty to count each one of these imported long sticks as three electric light carbons, hence the protest. The Customs board of classification gave a hearing on the matter on the 1st inst., and the question will be referred to Washington. (See *ELECTRICITY*, Vol. XIII, p. 212, "Duty on Carbons.")

Philadelphia.—At the annual meeting of the stockholders of the Wissahickon Electric Railway Company, on the 25th ult., they decided to accept the proposition to lease to the Roxborough, Chestnut Hill & Norristown Traction Company.

Pittsburg, Pa.—The Westinghouse Machine Company has just made a shipment of electrical machinery into the Klondike. The shipment consisted of two motors and the appliances necessary to operate a wire rope tramway across the Chilkoot Pass and was billed to the Dyea Transportation Company. A power house is being erected thirteen miles from the entrance to the pass and the power will be transmitted that distance. The Dyea Company will carry passengers and freight across the pass in baskets suspended on ropes. One of the latter will be operated by a thirty and the other by a fifteen horse power motor.

Port Jefferson, N. Y.—The Port Jefferson & Patchogue Traction Company have accepted the franchise for their road as amended by the highway commissioners. It is estimated that the road will cost about \$200,000, and the company will solicit stock to the amount of \$50,000.

Providence, R. I.—Mr. Randall of Scituate has introduced a bill in the House changing the name of the Cowesett Terminal & Transportation Company to Providence & Danielson Railway Company and authorizing the company to construct and operate an electric railway in the towns of Johnston, Smithfield, Scituate, Gloucester and Foster, with the assent of the town councils of said towns. The bill was referred to the Committee on Corporations.

Sac City, Ia.—A public vote is to be taken here shortly on the question of granting a franchise to an electric light company.

Springfield, Mass.—The question of municipal street lighting will be given a thorough investigation by the street lighting committee this year. The committee

will send inquiries to towns and cities that furnish their own light, and may inspect some lighting plants in person. The present contract with the electric light company does not expire until the spring of 1899.

St. Cloud, Minn.—The St. Cloud City Street Car Company's road and plant were bought in at foreclosure sale on the 29th ult. by Jared How of St. Paul, representing the bondholders, for \$5,410.52. The property cost originally \$40,000. The company will be reorganized.

Tacoma, Wash.—Machinery and men were sent on the last steamer to install the new electric plant at Skagway and Dyce for which C. B. Hurley of Tacoma made arrangements on his recent trip to Alaska. Bert Johnson, formerly city electrician of Tacoma, will have charge of the electric work.

Tonawanda, N. Y.—The opponents of the proposed municipal electric lighting plant scored an overwhelming victory at the election held here on the 29th ult., the vote being 339 against to 64 in favor of the proposition.

Warren, O.—Application has been made to the city council by the Trumbull Electric Railroad Company for an extension of its franchise to 50 years, instead of 25. The company contemplates placing larger cars on the line and otherwise improving it if the extension is allowed. The line runs from Warren to Niles, with two branches in Warren.

Wilmington, Del.—A deal has been consummated by which the Wilmington City Railway becomes the property of a syndicate organized by Clark & Co. Robert Wetherill of Chester, Pa., and Messrs. Widener and Elkins of Philadelphia are reported to be leading members of the syndicate.

Worcester, Mass.—An electric railroad project for a line from Worcester by way of Marlboro, Maynard, Concord and Chelmsford is attracting attention here and will probably be carried out.

Westwood, N. J.—C. M. Ottignon proposes to establish an electric lighting plant here, and is making a canvass of the town to ascertain what patronage he might expect.

NOTES FROM A CORRESPONDENT.

Schenectady, N. Y.—The General Electric works closed at 1 P. M. Saturday last and remained closed until Wednesday in order to permit the annual inventory of stock by the company.

Troy, N. Y.—The valuable electrical apparatus and instruments belonging to Doctors Scott and Fanning, who had a branch office in Gloversville, were destroyed in the Alvord House fire there.

Whitehall, N. Y.—At a meeting of the village trustees the contract for lighting the village by electric light has been awarded to E. L. Ashley of Fort Ann.

PERSONAL AND MISCELLANEA.

It is expected that by February 15 Siemens & Halske will have ready the electrical plant which is to light the City of Mexico. The entire plant will furnish 40,000 incandescent lights and 600 are lights for the city. Most of the machinery and supplies for this plant have been sent from New York, including poles and other apparatus.

James Heber Roberts, of St. Louis, although only fourteen years old, gives promise of becoming an electrical wizard, and has the St. Louis "Republic" says, received an invitation to place his inventions on exhibition at the Electrical Exhibition to be held in Madison Square Garden in May next, where space is to be given to juvenile work. Young Roberts is the son of the editor of the "American X-Ray Journal," and has done some surprising things in electrical construction.

The device of C. B. Martin, an electrician and son of Superintendent C. B. Martin, for keeping tally of the trolley cars crossing the Brooklyn Bridge consists of a series of magnets which are introduced in a special feed wire. This will lead to an insulated section of the regular trolley wire for a distance of sixty feet. Every time a car passes this section the instrument will register one toll in the collector's box. The trolley cars will be charged a toll of five cents for the round trip and the elevated companies will pay 12 cents for each of their cars. The revenue to the Bridge from this source will be between \$150 and \$250 a day.

The Mayor of Macon, Ga., in his annual address speaks well of the electrical department of that city. "This department," he says, "is rapidly growing to be one of the most important of the government. I am glad to say that it is kept to the highest standard by our electrician and the committee on electricity, and is pointed to by the best electricians as the best kept and best equipped system in the South. It is a pleasure to compliment this department on its splendid condition."

The Mackey mausoleum in Greenwood Cemetery, Brooklyn, has been equipped with electric apparatus for lighting and heating, and is probably the only private tomb in the world thus furnished. The use of heat and light in such a place might strike most people as fantastic, but the necessity is obvious enough when it is learned that the mausoleum contains a small chapel in which daily prayers are to be offered up for the dead. This magnificent tomb was erected to the memory of young John W. Mackey, the favorite son of the millionaire of that name, who was accidentally killed in France a few years ago and whose remains now rest within the structure.

President John Scullin of the Union Depot Railway Company at St. Louis, is so closely identified with the

progressive enterprises of that city that his name is as familiar there as almost daily mention of it in the local newspapers can make it, and the St. Louis "Star" gives this portrait of him: "John Scullin is one of the most pleasant and genuinely liked men in St. Louis. Although absorbed in business he is always ready to give attention to those who desire to consult him or talk with him, and in every way he shows the genial, affable man that he is. In appearance, he reveals in his pleasant smile and kind features his fine character, and that is perhaps the reason that he has frequently been appealed to for aid by entire strangers. He has done many good deeds of which he never speaks. His employees are all warm in praise of his kind treatment of them. The incident in the disastrous tornado that swept over St. Louis May 27, 1896, will never be forgotten by some of his men. Mr. Scullin's great electric plant on Missouri and Geyer avenues was razed to the ground, and several employees maimed and killed. While he set at once to work to rebuild the plant, he did not forget in his tremendous losses his unfortunate employees, but pensioned and provided for their families and saw that the injured were given every attention."

RECENT COMPANY ELECTIONS.

Atlanta Consolidated Street Railway Company, Atlanta, Ga.—President and general manager, M. E. Woodruff (to succeed Joel Hurt, resigned); treasurer, R. J. Lowry; superintendent, H. N. Hurt; secretary, T. K. Glenn; assistant superintendent, N. W. L. Brown; directors: R. J. Lowry, S. M. Inman, W. C. Sanders, H. M. McKeldin, E. Woodruff, M. L. Moore, H. E. W. Palmer, H. A. Inman, J. C. Payne, J. T. Dargan, Joel Hurt.

Electric Light & Power Company, Clinton, Ia.—Directors: A. G. Oatman, W. H. Talbot, J. B. Webb, W. A. Cotton, T. F. Reed, A. M. Price, J. A. Hannum.

Edison Electric Illuminating Company, Tiffin, O.—President, W. P. Noble; vice-president, J. M. Naylor; secretary, J. F. Bunn; treasurer, C. J. Yingling; directors: the officers and Joseph P. Myers, E. B. Hubbard and J. M. Greiner.

Fall River & Stone Bridge Electric Railway Company, Fall River, Mass.—President, William A. Tucker, Boston; treasurer, Philip T. Saltonstall, Milton; clerk, A. Lincoln Hamby; directors: W. A. Tucker, P. T. Saltonstall, A. L. Hamby, S. Gillman Bowen of Tiverton, G. B. Swift and Messrs. Stevens and Goff. The interests of the New York parties in the company have been transferred to Messrs. Tucker, Anthony & Co. of Boston. It is probable that the road will be consolidated with the Portsmouth & Middletown Company, thus making a continuous line from Newport to Fall River.

Greenfield Electric Light & Power Company, Greenfield, Mass.—President, F. E. Mills; treasurer, A. J. Doolittle; clerk, Charles W. Keith; auditor, Coyt F. E. Pierce; directors: Joseph W. Stevens, F. E. Wells, John H. Sanderson, N. S. Cutler and F. O. Wells.

Kansas City, Lawrence & Topeka Railroad Company, Kansas City, Kan.—President, E. B. Purcell, Manhattan, Kan.; secretary, John G. Johns, Houston, Tex.; assistant secretary, Edward G. Anderson, Kansas City, Kan.; treasurer, James Haggart, Kansas City, Mo. Directors: Henry McGrew and W. L. Wood, both of Kansas City, Kan., and E. E. Holmes and A. N. Gossett of Kansas City, Mo.

Lebanon & Annville Electric Railway Company, Lebanon, Pa.—Directors: Simon P. Light, H. H. Light, H. H. Kraider, A. Hess and Harry Nutting.

Mahoning Valley Railway Company, Youngstown, O.—Directors: G. Parmelee, G. Herrick, B. F. Miles, W. H. Lawrence, J. G. Butler, Jr., A. A. Anderson, C. F. Clapp, R. G. Sykes.

New London Electric Company, New London, N. H.—President, Le Roy F. Griffin; vice-president, William A. Messer; treasurer, Charles E. Shepard; clerk, Herman S. Adams; directors: Le Roy F. Griffin, Charles Woodward, Joseph M. Clough, Merrill Robie and James E. Shepard.

Newark, Somerset & Stratford Railway Company, Newark, O.—President, David Lee, Zanesville; secretary, P. C. Sneed, Chicago; directors: the officers and R. T. Davaries, J. R. McCortney and J. D. Culbertson, of Wheeling, W. Va.; Lincoln Richards and Franklin Ames, of Chicago; P. E. Werner, Akron, O.; John Reed of Mansfield, O., and L. M. Graham of Newark.

Newport Street Railway Company, Newport, R. I.—President, Gardiner B. Reynolds (in place of A. C. Titus, resigned); directors: Henry Darling of New York and George P. Magner of Newport, in place of Judge Baker and Anthony Sherman, resigned. The changes make the board practically the same as that of the Newport Illuminating Company, which owns a controlling interest in the railroad.

Norwich Gas & Electric Company, Norwich, Conn.—President, Edward N. Gibbs; vice-president, George E. Terry; treasurer, Morris E. Tyler; secretary, A. M. Young; directors: Edward N. Gibbs, New York City; George E. Terry, A. M. Young, Waterbury; Morris E. Tyler, New Haven; Garrett A. Hobart, Newark, N. J.; H. H. Osgood, William C. Mowry, Norwich.

Penn Yan Electric Light & Power Company, Penn Yan, N. Y.—President, Calvin Russell; vice-president and treasurer, C. T. Birkett; secretary, W. Stanley Bruen.

Reading Electric Light & Power Company, Reading, Pa.—President, Jerome L. Boyer; secretary and treasurer, J. K. Righter; directors: Jerome L. Boyer, Levi Quier, O. W. Stager, John G. Mohn, James Nolan, Henry Darling and J. K. Righter.

Wissahickon Electric Railway Company, Philadelphia—President, Peter Liebert; vice-president, Wm. Flanagan; secretary and treasurer, John Flanagan; directors: Wm. Johnston, James Christie, L. M. Jones, John Kenworthy and Ben Kenworthy.

Wilkes-Barre & Wyoming Valley Traction Company, Wilkes-Barre, Pa.—President, John Graham; secretary and treasurer, Theodore S. Barber; directors: B. F. Myers, Patrick Russ, Harrisburg; J. J. Patterson, Philadelphia; Robert McLean, Chambersburg; J. W. Hollenback, John Graham, Benjamin Reynolds, W. G. Eno and George N. Reichard, Wilkes-Barre.

COMMERCIAL PARAGRAPHS.

We would call our readers' attention to the advertisement of the Warren Electric & Specialty Company that is to be found in this issue. As is well known, this concern manufactures High Grade Anti-Trust Incandescent Lamps, one of the very best on the market. Persons purchasing from the above company can depend on being properly treated, as the Warren Electric & Specialty Company is in no way connected with the Lamp Pool of unsavory reputation. The price of their lamps is low for a good article, and although the Trust may possibly offer to furnish some kind of a lamp for less money we would strongly recommend any one in need of such an article to purchase it from the Warren Company.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

The Frank B. Rae Engineering Company, of 134 Monroe street, Chicago, has for some time made a specialty of municipal engineering, and stands ready to furnish plans and specifications of waterworks, electric lighting plants or other works of like nature. Mr. Rae, who is at the head of the company, is an engineer of wide and practical experience. His work, especially in electric railways and elevator design, is well known, and whatever he advances in machine design is sure to be worthy of consideration. Of late he has devoted much of his time to bringing out a new form of electric vehicle which embodies several valuable improvements. It will not be long before this electric carriage will probably be extensively used.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedial Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

INCORPORATIONS.

Central Electric Company, Painesville, O. Capital stock, \$10,000.

The Dayton, Troy & Tippecanoe Electric Railroad Company, Cleveland, O. Capital stock, \$10,000.

The Colville Electric Light & Water Company, Colville, Wash. Capital stock, \$50,000. Incorporators: Julius Pohle, Henry Oakes, W. B. Aris and S. Douglas.

The Lurye-Lewis Electric Protective Company, New York City. Capital stock, \$5,000. Directors: H. J. Lurye, M. H. Lewis, Simon Schwarz and Joseph Schwarz, New York City.

The Electrical Railway Equipment Company, Washington, D. C.—to manufacture and supply equipment for electric railways. Capital stock, \$100,000. President, Archibald Greenless.

The People's Electric Light, Heat & Power Company, Ocean City, N. J. Capital stock, \$50,000. Incorporators: George Pfeiffer, Jr., George Barrett and J. Rufus Eastlock, all of Camden, N. J.

The Chestnut Hill Electric Company, Philadelphia, Pa.—Capital stock, \$10,000. Directors: Robert J. Moore, Daniel J. McNichol, Samuel F. Clovenger, William Macdonald, William N. Topham, Edward White, Samuel W. Ray, Philadelphia.

The Cicero & Harlem Railway Company, Chicago, Ill.—to build a line of railroad from the east line of the town of Cicero to the west line of Cook County, Ill. Capital stock, \$1,000,000. Directors: D. H. Louderback, Benjamin C. Stidger, Charles V. Weston, J. Charles Moore and Charles N. Whitehead.

The Main, Fifth and San Pedro Street Railway Company, Los Angeles, Cal.—to build a street railway in Los Angeles to be operated by animal, electric or cable motive power. Capital stock, \$500,000. Directors: Lovell White and Antonio Borel of San Francisco, and Frank Gibson, J. W. Hellman, J. C. Kays, J. Kuhrt and W. C. Patterson of Los Angeles.

The Snoqualmie Falls Power Company, Seattle, Wash.—to own and develop the power of rivers for electrical and manufacturing purposes; to own, acquire and operate cable and electric railways, municipal and suburban, and to engage in electric lighting and heating in the cities of Washington. Capital stock, \$500,000. President, Charles H. Baker. Among the directors are William T. Baker of Chicago, Sol. G. Simpson, R. B. Spencer and A. H. Anderson.

The Chicago & Desplaines Valley Electric Railway Company, Chicago, Ill.—to construct and operate an electric railway from a point in the town of Wheeling to some

TELEPHONE AND TELEGRAPH.

point in the town of Lemont, Ill. Capital stock, \$1,000,000. President, Charles D. Evans of Chicago; vice-president, Clayton E. Crafts of Chicago; secretary and treasurer, Philip H. Gray of Maywood; directors: Henry G. Foreman, Clayton E. Crafts, Charles D. Evans of Chicago, Philip H. Gray and W. M. Hulbert of Maywood.

The Sandusky, Norwalk & Toledo Railway Company, Sandusky, O.—to build an electric road from Sandusky to Norwalk and from Sandusky to Toledo. Capital stock, \$1,000,000. Incorporators: Charles Rudd, W. W. Graham, A. J. Stoll, Henry G. Fowler and W. E. Guerin, Jr., all of Sandusky.

The Fort George & Eleventh Avenue Railroad Company, New York City—to operate with power other than steam a road on the Boulevard or Eleventh Avenue from Kingsbridge to 175th street. Capital stock, \$10,000. Directors: John T. Little, Jr., D. S. Johnstone, Charles R. La Rue, Fred C. Garrick, Thomas Hanlon, Jr., and Harry J. Turner of New York City, C. M. Cumming of Yonkers, J. Howard Brouse of Mount Vernon, and Charles A. Gilbert of White Plains.

The La Grange, Warrenville & Fox River Electric Railroad Company, Chicago, Ill.—to construct and operate an electric railroad in Cook, DuPage and Kane counties, Ill. Capital stock, \$100,000. Incorporators: George W. Waite, A. C. Allen, M. C. Covell, A. H. Kemman, Frederick Poulsen, J. W. Kruger and Edward S. Ely, all of LaGrange; James M. Vallette, B. B. Boecker, I. N. Murray, Willard Scott, George Remps and C. L. Schwartz of Naperville; William J. Manning, John McKee and A. T. Jones of Warrenville; Henry W. Grote, J. J. Cole, Ira Brown, Elbert H. Gary and George W. Brown of Wheaton; George W. Wilson of Hinsdale and J. M. Vallette of Naperville.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 1, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

598,099. Station Indicator. Dudley C. Jones and Jacob M. Jones, St. John, Ky. Filed March 26, 1897.

598,181. Conductor for Electric Railways. Georg Ritter, Stuttgart, Germany. Filed Oct. 16, 1896.

598,193. Mechanism for Starting, Stopping and Controlling Speed of Motors of Electric Cars. Frank H. Foster, Brooklyn, N. Y. Filed Aug. 12, 1897.

598,200. Electrical Conductor. Louis C. Werner, Broadbrook, Conn. Filed June 15, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

598,198. Electric Lamp for Bicycles. Peter A. Dowd, Boston, Mass., assignor to the Dowd Electric Company, same place. Filed July 10, 1897.

598,218. Adjustable Support for Incandescent Lamps. William J. Going, Amsterdam, N. Y., assignor of one-half to Leonard Weldon, same place. Filed May 26, 1897.

598,219. Support for Incandescent Lamps, etc. William J. Going, Amsterdam, N. Y., assignor of one-half to Leonard Weldon, same place. Filed July 21, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

598,092. Alternating Current Motor. Alexander Heyland, Frankfurt-on-the-Main, Germany. Filed Dec. 29, 1896.

598,160. Electric Fire Alarm. Circuit and Signal-Box. Lewis G. Rowand, Camden, N. J., assignor to the Universal Fire Alarm Company of New Jersey. Filed Jan. 5, 1897.

598,208. Electric Meter. Carl D. Raab, Kaiserslautern, Germany. Filed Dec. 30, 1896.

598,209. Electric Meter. Carl D. Raab, Kaiserslautern, Germany. Filed June 24, 1897.

598,211. Brush-Holder. August J. Oehring, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 30, 1896.

598,272. Instrument Winding Device. August J. Oehring, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 12, 1896.

598,276. Self-Restoring Annunciator. Josef Steiner, Brooklyn, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed May 23, 1896.

598,328. Terminal Head for Electrical Conductors. Charles H. Sewall, Chicago, and Henry E. Procuier, Oak Park, Ill. Filed Aug. 22, 1896.

598,338. Electric Circuit Controller. William T. Budd, Charleston, S. C. Filed Aug. 30, 1897.

598,410. Fire and Burglar Alarm System. Charles P. Boston, Milton, Pa., assignor to the Boston Automatic Burglar & Fire Alarm Company, same place. Filed April 27, 1897.

ELEVATOR APPARATUS.

598,037. Electric Control Device for Elevators. John D. Hilder, Yonkers, N. Y., assignor to the Otis Brothers & Company, New York City. Filed April 18, 1896.

TELEPHONE AND TELEGRAPH APPARATUS.

598,172 and 598,183. Telephone System. Charles A. Barron, Robert T. Reid and James McDonnell, Tacoma, Wash., assignors of one-half to Frank C. Cardin and John T. Bibb, same place. Filed April 5, 1897, and May 7, 1897.

598,285. Telephone Apparatus. Frank B. Cook, Chicago, Ill. Filed March 25, 1895. Renewed Dec. 16, 1897.

MISCELLANEOUS.

598,109. Insulating Attachment for Electrical Connectors. Richard P. Osgood and John D. Osgood, Methuen, Mass. Filed June 28, 1897.

598,180. Apparatus for Electrolytically Producing Zinc. Carl Hoepfner, Giessen, Germany. Filed Oct. 7, 1892.

598,193. Apparatus for Electrodeposition of Gold and Silver. Emile Andreoli, London, England. Filed Oct. 1, 1895.

598,303. Electric Heater. Elmor E. Cruzen, Baltimore, Md. Filed Aug. 7, 1897.

598,313. Electrodeposition of Lead. Ernest P. Clark, New York City, assignor of one-half to Charles S. Campbell, same place. Filed June 8, 1897.

598,316. Electric Gas-Lighting Apparatus. Christian Elckman, Indianapolis, Ind. Filed July 3, 1897.

598,318. Electric Furnace. James E. Hewes, Philadelphia, Pa. Filed April 27, 1897.

598,429. Electric Cigar-Lighter. William F. Kessler, Auburn, Ind. Filed July 22, 1897.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY.**

In Honor of the First Telephone Exchange.

The first telephone exchange in the world was opened in the Boardman building in New Haven, Conn., on January 28, 1878, and in commemoration of the event a banquet was given at the New Haven House in that city on the 28th ult. The president of the New England Telephone Company, Morris F. Tyler, presided, and among those present were General Superintendent E. B. Baker, the assistant superintendents, and a number of electrical experts and long service employees of the company; William D. Sargent, vice-president of the New York & New Jersey Telephone Company; D. J. Carson of the Southern Bell Telephone Company; Samuel Ivers, treasurer of the Southern Massachusetts Telephone Company of New Bedford; Gen. E. P. Meany, one of the managers of the Long Distance Telephone Company, with headquarters at New York; W. J. Denver, assistant manager of the New England Telephone Company of Boston, and Thomas D. Lockwood of Boston. The intellectual part of the feast consisted of informal speeches treating of the inception and wonderful growth of the telephone business and enlivened by anecdotes of men and incidents connected with the industry. The New Haven News, from whose account the foregoing is collated, states that George W. Coy and H. P. Frost established the telephone business in New Haven under the name of the District Telephone Company. They obtained the idea of a switchboard from Isaac B. Smith of Hartford, and were guided in the new enterprise by Morris F. Tyler, who acted as counsel for the new firm. In May, 1880, the Connecticut Telephone Company was organized with Marshall Jewell, Charles L. Mitchell, H. P. Frost and Morris F. Tyler as members. Mr. Tyler is the only survivor.

At Richmond, Va., on the 1st inst., Judge Simonton in the Court of Appeals handed down a decision in the case of the city of Richmond against the Southern Bell Telephone and Telegraph Company. The case involved the act of Congress of 1866 declaring that the streets of a city are post roads of the United States. Judge Simonton holds that, while the act specifies only telegraph companies as entitled to its provisions, a telephone is to all intents the same thing and therefore entitled to its privileges. The Bell Telephone Company's charter having expired, the city exercised its stipulated right to revoke it, but was enjoined from interfering with the company's poles and wires. The effect of the decision is to modify the injunction so as to prevent the city from driving the company from its streets, but the city is to retain its police power over it.

O. K. Dickson Walsh, manager of the Kinloch Telephone Company, St. Louis, stated at a recent meeting of members of the Real Estate Exchange that his company expects to have its system of telephones in use in St. Louis and East St. Louis not later than August 1 of the present year. He said also that the Kinloch company had leased its exchange headquarters in St. Louis for twenty years and had no intention of selling out, leasing or consolidating with any other company; it is successfully operating systems in Detroit, Little Rock and Fort Wayne, Ind. Mr. Durant, the Bell manager, also addressed the Real Estate men, explaining the change in the form of contracts adopted by his company, and promising a much improved service. He said the Bell Telephone Company has between 4,000 and 5,000 telephones in use in the business houses of St. Louis.

The Minneapolis city council has passed a resolution granting to the Minnesota Central Telephone Company the right to enter the city of Minneapolis for the purpose of operating its long-distance telephone system. By the ordinance the company will be permitted to lay its wires into the city and maintain public telephone stations and instruments for private use at such points as may be authorized and designated by the city council. The ordinance does not permit of the establishment of a central office or a general local system in the city. The company is to confine itself entirely to long-distance business, and when a business man desires one of its 'phones placed in his establishment, authority must be first secured from the city council before the instrument may be so placed.

The House of Representatives on the 1st inst. adopted an amendment to the District of Columbia appropriation bill, fixing the price of telephones in the District of Columbia at \$50 per year when on a single wire and with proportionate decrease on wires on which one or more instruments are in use. The House has several times adopted such an amendment, but the Senate has invariably defeated it. The price for a single-wire telephone is now \$100, and the residents of Washington think they are imposed upon.

A special to the Pittsburgh papers from Uniontown, Pa., states that the new telephone company establishing competing exchanges in Uniontown, Connellsville and at other points has let the contract for about \$40,000 worth of switchboards and telephones for its new stations to the

Stromberg-Carlson Telephone Manufacturing Company of Chicago, and expect to have exchanges in operation early this month. It has contracts for 400 subscribers in Uniontown and 350 in Connellsville.

Recently at St. Paul, Minn., State Treasurer Koerner received a check for \$20,772 from the Western Union Telegraph Company in payment of the tax for 1897 on its property in the State of Minnesota. The State Board of Equalization assessed the company at \$865,500. The tax rate is 24 mills. A printed notice accompanied the check, stating that the company paid the tax under protest, conceding neither the justness of the tax nor the right of the State to collect any tax.

The Missouri & Kansas Telephone Company has purchased the local telephone line from Guthrie, Ok., to Chandler and Stillwater, and will at once extend the line to Wellston and Stroud. They will complete their line from El Reno and Oklahoma City, and at once continue north to Arkansas City, giving direct connection with Wichita and Kansas City.

The Onancock (Va.) Telephone Company has decided to extend its line to Keller Station where it will unite with the line of the Harborton Telephone Company. This will put Onancock in direct communication with nearly all the villages and towns in the central and southern part of Accomac County. It is thought that arrangements will soon be made to connect with the Hall and Atlantic Telephone Companies, whose wires cover the northern part of the county.

Josiah Holbrook, of Chicago, president of the National Telephone Company, was in St. Louis a few days ago and told a *Chronicle* reporter that he had his eye on several live towns in the vicinity of St. Louis, and may endeavor to secure telephone franchises from them. He said: "The independent companies are becoming stronger every day and are giving the Bell Company a great fight."

On the 29th ult. all the local express offices at Grand Rapids, Mich., ordered their Bell 'phones out. The express companies have agreed, as a measure of economy, to limit their telephone service in each town to one system, and have left the selection with local agents. The home company is selected at Grand Rapids. It is believed other business houses will follow suit.

The Citizens' Telephone Company at Columbia, Tenn., has not only succeeded in raising the money necessary to pay off its debt of \$4,400, but has secured \$1,100 additional, which will be used in putting in a new switchboard and making other improvements to the plant. That company deserves success.

The Dominion Government has decided to extend its telegraph service from Quevelle to Teslin Lake and Dawson City, 1,322 miles. The route is that followed by the Russian American Telegraph, abandoned in 1868.

The Gilliland Company at Adrian, Mich., will make the Smith Vassar automatic telephone, the inventors having decided to locate their business at Adrian.

The Astoria Telephone Company, Astoria, Ill., has certified to a dissolution of organization and made a surrender of charter.

A stock company is being organized at McGhee, Tenn., to build a telephone line from Vomore to Loudon and also an independent line from Vomore to Madisonville.

New Companies Incorporated.

The Oneida Telephone Company, Oneida, N. Y. Capital stock, \$15,000. Directors: Oliver Watson, T. C. Becker, Edward Michaels, and Henry Koons, Buffalo; Martin Cavona, E. E. Coe and J. T. Durham, Oneida.

The Franklin & Fulton Telephone Company, McConnellsburg, Pa. Capital stock, \$1,480.

The Electric City Telephone Company, Great Falls, Mont. Capital stock, \$20,000. Incorporators: G. H. Stanton, S. R. Jensen, M. L. Lane, G. W. Dunlap and C. L. Herzog, all of Great Falls. The company is operating a line in Great Falls.

The Litchfield Telephone Exchange, Litchfield, Minn. Capital stock, \$10,000. Incorporators: T. F. McClure, F. E. Bissell, S. W. Leavitt, P. E. Hanson, L. J. Lundemo, J. B. Atkinson and H. I. Peterson.

The Meredith Telephone Company, Delhi, N. Y.—to maintain a telephone line in Delaware and Otsego counties. Capital stock, \$2,000. Among the directors are Thos. M. Ware, J. Milo Graham and Porter Dean, of Meredith.

The Jersey City Contracting Company, Jersey City—to build telephone and telegraph lines. Capital stock, \$100,000. Incorporators: John E. Wright of New York and Fred L. Benzon of Newark, N. J.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

Late quotations for copper are: Electrolytic, 10½¢@10½¢; Lake, 10½¢@11¢; cast, 10½¢@11¢.

The West Chicago Street Railway Company has declared a quarterly dividend of 1½ per cent., payable February 15.

A new tariff went into effect in Tasmania on January 1, and under its provisions electric light cables and insulators are subject to a duty of 10 per centum ad valorem.

The Philadelphia "Times" states that in 1897 the Electric Storage Battery Company of that city earned enough to pay three years' accrued interest on the preferred stock.

It is reported on good authority that the Baltimore Consolidated Traction for the first six months of its fiscal year, July 1 to December 31, increased its net earnings more than \$100,000.

The National Abrasive Manufacturing Company, capital \$1,000,000, has been incorporated at Trenton, N. J., to purchase land in North Carolina particularly valuable for deposits of corundum.

A receiver has been appointed for the Michigan City Street Railway, which is owned by Russell Harrison, son of ex-President Harrison. The liabilities are estimated at \$40,000. What the assets are is not stated.

The New York "News Bureau" says it is currently reported that there will be some sort of a stock dividend made to the stockholders of the Edison Electric Illuminating Company at the annual meeting to be held in a few days.

Contracts are being prepared by the superintendent of the Third Avenue Railroad Company, New York, for changing the motive power on the company's "Boulevard" line and likewise for changing the Fort Lee Ferry and Fort George lines from cable to electricity.

The Boston "Post" in a strong editorial on telephone reform suggests that the regulation of the telephone business in Massachusetts be placed in the hands of the Gas and Electric Light Commissioners. The "Post" demands lower rates. A telephone reform bill has been drawn up to be presented to the Legislature.

At the annual meeting of the Edison Electric Illuminating Company of Boston, held on the 1st inst., the board of directors were re-elected, as follows: Walter C. Baylies, Henry B. Cabot, T. Jefferson Coolidge, Jr., C. H. Custer, George Dexter, C. D. Edgar, W. Powell Mason, John C. Rogers and George S. Silsbee.

The stockholders of the Kinloch Telephone Company, St. Louis, have adopted a resolution in favor of issuing \$1,000,000 in bonds. In speaking of the bonds General Manager H. J. Hunford said that they had all been subscribed for some time by the directors and stockholders of the company, but that they had not decided when the new bonds would be issued, as they had not yet been printed or engraved.

A motion was made before Judge Simonton at Charleston, S. C., last week requesting that the order allowing the Western Union Telegraph Company until the April rules to file their replication to the answer of the Railroad Commission as to the telegraph rates in that State be rescinded or the time lessened. The motion was denied, therefore the company has until the April rules to file its replication.

Ex-Congressman John Kean has offered the Freeholders of Union County, N. J., \$100,000 for a trolley road franchise between Elizabeth and Plainfield. Mr. Kean stipulates that the money shall be used in widening the avenue on which the tracks are to be laid. A committee consisting of Freeholders Littell, Ogden, King, Wahl and Swain was appointed to confer with Mr. Kean in reference to details. The offer is the first of its kind ever made in New Jersey.

The stockholders of the Erie Canal Traction Company, which is said to have the exclusive right to equip the canals of New York State with electricity, held their annual meeting last week. Directors elected were: L. A. von Hoffmann, W. G. Oakman, R. S. Hayes, G. G. Haven, T. C. Pratt, F. W. Hawley, A. S. Heidelberg, Commodore P. Velder and C. T. Lewis. At a subsequent meeting the following officers were elected: L. A. von Hoffmann, president; F. W. Hawley, vice president; C. T. Lewis, secretary.

Judge Gottfried Krueger, the millionaire Newark brewer and trolley magnate, has announced the cessation of hostilities between the New York & Philadelphia Traction Company and the Brunswick Traction Company. This clears away the only great obstacle for the New York & Philadelphia line by way of Somerville and Bound Brook and work on this line will be rapidly pushed to completion. Another line is to run from New York to Easton. In this connection it is reported that a trolley combination is on the verge of completion which proposes to connect Philadelphia and New York by a direct trolley line. The new company is to be known as the Union Traction Company of New Jersey and is to be capitalized at between \$50,000,000 and \$100,000,000.

The Mexican Government has published an order to the Mexican National Railroad Company and the Mexican Central Railroad Company, notifying them that they must discontinue handling commercial and other telegraph messages between the United States and Mexico. According to the order the railroads may use their telegraphs "solely to serve in safeguarding the running of trains." The effect of the order, if fully carried out, means that the telegraph service in Mexico must be carried over the Federal lines. Under a contract between the Government and the Mexican Telegraph Company, operating by cable from Galveston to Vera Cruz, with the Western Union from Laredo and El Paso, all international telegrams must under the order be carried by those companies. The Postal Telegraph Company, which has been using the railroad lines for some time, holds that the order is unconstitutional and will not be sustained by the Mexican courts.

Attorney General Grey of New Jersey has begun suit in the Supreme Court of that State against the Electro Pneumatic Company, whose principal office in the State is in Camden. The suit is started in the nature of an information. The company owes \$1,700 for taxes and its charter was recently forfeited by proclamation by the Governor for the non payment of this tax. The State understands that the company is still doing business, and the object of the suit is to force the payment of the back tax or to compel the company to desist from attempting to operate under its charter. The matter will come up for hearing February 14. Some time since the company was transferring its stock to the Manhattan Trust Company of New York, but the further doing of this was enjoined by Chancellor McGill. W. W. Allen of Philadelphia is president of the company.

The National Conduit Cable Company of New York has brought suit in the Circuit Court of Baltimore against the Eastern Electric Company, David M. Newbold and James W. McEnoy, receivers, and the United States Trust Company, to have declared void a mortgage made by the Eastern Electric Company to the United States Trust Company on July 15, 1897, for the purpose of securing an issue of bonds to the value of \$50,000. The New York Company alleges that the bonds were never sold, and the Eastern Electric Company never received any return for them; that the entire issue was placed in the hands of William J. Atkinson, at that time an employee of the company, and that he took bonds outside of the State of Maryland. It is said that it cannot now be ascertained where he is, but that the interest on the bonds is about to fall due, and that it will be demanded of the receivers. It is alleged that the mortgage is void, and its payment would be a fraud on the creditors. The court is asked to enjoin the receivers from paying any interest on the bonds and to enjoin the holders from collecting either interest or principal.

EDITORIAL NOTES.

A Startling Theory as to Electricity.

Dr. William M. Gross of Gillespie, Ill., claims that he has invented an electrical machine which in his opinion will revolutionize the methods of producing electric power. In a recent issue of the St. Louis *Post-Dispatch* he is credited with making the following statement regarding his theory:

"My purpose is to capture and utilize the earth-seeking electricity. I am in opposition to the schools in believing that electrical force is induced and not static. I do not pretend to be an electrician. Time will tell whether I am a scientist."

It will be seen from the above paragraph that Dr. Gross holds that electricity is an induced and not a static force as is generally believed. With a view to proving his theory correct, he has carried on from time to time experiments in St. Louis by means of kites, with questionable success. Among other things, Dr. Gross asserts that the earth and its atmosphere go to make up an immense armature, with that portion of space between the earth and the sun as the electromagnet. His opinion is that the earth in revolving generates a powerful current, and he reasons this out as follows:

"The sun is shining on one-half of the earth all the time. Its rays are vertical on some portion of the earth all the time. The space between the earth and the sun is heavily charged with electricity. Currents of this electricity are induced out of space by the revolution of the earth from west to east. In accordance with the rule of electric currents, they pass in the opposite direction, going from east to west. This is in obedience to the law, interpreted by Lenz more than sixty years ago, that induced currents of electricity always go in opposite directions to the electro-magnetic force producing the current. These currents are brought down to and through the earth by the latter's centrifugal force. This force tends from the center and toward the east. The currents tend from the east and to the center of the earth. When the center becomes surcharged the current flows off at about the 70th parallel, producing the north and south winds."

The details of Dr. Gross' machine have been kept secret, but his idea is to develop an apparatus that will have proportionally greater centrifugal force than that of the earth. As the earth travels 17 miles a minute, his machine is designed to go even faster, in order to induce the electricity that he is striving to obtain.

According to Dr. Gross' statement, he has not only developed to his own satisfaction a new theory as to electricity, but also offers a new and startling explanation as to the cause of the winds. His theory is said to have originated from a discovery he made several years ago, while experimenting with the

ground wire of a telephone, that the earth was apparently full of electricity. Possibly the line on which he was experimenting was affected by some of the stray currents from the trolley railways that have been causing so much trouble with the telephone system lately in St. Louis. This would seem a reasonable explanation in view of the fact that up to the present the experiments he has conducted with his new apparatus have proven more or less unsatisfactory. Further experiments are shortly to be made, however, in St. Louis, which should either prove Dr. Gross' theory absurd or revolutionize our present doctrine and methods.

* * *

Wind as a Motive Power.

Considerable has been written of late of the great possibilities that lie in the wind-mill or modern aermotor for generating electric current economically. A few of the sensational dailies have pointed out from time to time how every high office building in New York could, by erecting suitable aermotors on the roof, obtain enough electric power by an arrangement of storage batteries to not only light the building but run the elevators as well. These papers have even endeavored to show by figures that there is in the neighborhood of 500,000 horse power going to waste every ten hours in Greater New York which could be had, practically without cost, for the taking. As far as figures go, almost any horse power could be named in this respect as going to waste without fear of contradiction. What amount of power the wind blowing over Greater New York represents in ten hours is an unknown quantity and cannot be figured out even approximately.

There is no doubt but what there is a large amount of power in the wind, which if properly utilized could be made to do an enormous amount of work. The Saracens and Egyptians were well aware of this fact, and utilized wind power for grinding corn and performing other species of work. As is well known, even in this country at the present day an improved form of windmill is extensively used, principally for pumping water.

Probably the latest invention of this nature is that of Victor L. Ochoa, who has developed an aermotor by means of which he proposes to turn wind into electricity. His device differs from the ordinary circular form in that it consists of four arms with a solid shutter-like arrangement on each. The shutters swing on hinges. While the wind is driving two of the shutters, it lifts the other two, so that they offer the minimum of resistance to the wind.

A local paper referring to the transformation of wind into electricity says:

"This conversion of energy, while it sounds like a startling proposition, is not such an extraordinary matter after all. Mr. Ochoa simply turns the power

of a windmill into electrical force. He accomplishes that much by the most simple process imaginable—that of attaching a dynamo to a windmill.

"There's nothing extraordinary in that, except that no one seems to have thought of doing it before."

The writer of the above paragraph would seem to assume that the running of a dynamo by means of a windmill is something that has never been attempted. If we mistake not Dr. Fridtjof Nansen in his last attempt to reach the North Pole had the Fram equipped with a specially designed windmill which when operating drove a dynamo and furnished the necessary current for lighting purposes. An aermotor erected on the roof of a building in Park Place in this city has been for some time successfully driving a dynamo in connection with a storage battery plant, the current from which has been utilized for incandescent lighting. From this it will be seen that there is nothing very new in the application of windmills to the driving of dynamos. There are probably several reasons why the windmill or aermotor has not been more universally adopted for the above purpose. In the first place, such a motive power is always more or less uncertain and cannot always be depended upon. There may be a calm just at the time it is found necessary to recharge the batteries, or the batteries may be in use when a breeze springs up. This would necessitate having two sets of batteries at a considerable cost. Another reason why aermotors have not been more extensively adopted is probably due to the fact that current can now be generated with steam as a motive power very economically, especially in large quantities. The erecting of an aermotor and the installation of a number of storage batteries with a dynamo means a considerable outlay of money, especially when the cost of maintenance and renewals is taken into account. In certain cases it may be found that the interest on the batteries, generator and windmill, with the labor item figured in, will cost as much in the long run as the current could be purchased for on the outside. But probably the chief reason why the power of the wind is allowed to go to waste when it could be employed for generating electricity is the same as that which prevents the use of the immense power derivable from the tides in both the Hudson and East rivers from being utilized, namely conservatism, or if not, lack of progress, a slowness in availing ourselves of opportunities.

* * *

The New Trolley Systems and Snow.

There would seem to be a general movement on foot among the street railway companies, more especially in the Borough of Manhattan, to substitute the electric conduit system for the cable that is now in use. The Third Avenue Railroad Company has now apparently caught the fever which its rival, the Metropolitan Street Railway Company, has had for some time, and proposes to equip its lines at no distant date with electricity. Among the lines to be at once equipped with the electric conduit system are the Forty-second Street, St. Nicholas Avenue and Manhattanville Railroad and the Dry Dock road. New lines are to be built on Washington Heights, jointly by the rival companies, which will connect with the Forty-second Street line and will be operated by the underground trolley. To enable cars to be run continuously from Forty-second street to Washington Heights it was found necessary to adopt a uniform motive power. The Third Avenue Company has therefore built a large electric power station near the Kingsbridge road.

Officials of the Third Avenue road are quoted as stating that statistics they have received in regard to the operation of the underground trolley in large cities have convinced them that electricity is not only much cheaper than horses, but also less expensive than the cable. Furthermore, the underground trolley has shown its adaptability to heavy traffic, and it apparently makes no difference whether cars run on one minute headway or five minutes apart.

There is little doubt but what in the long run electricity as a motive power is more economical than horses, but whether it is less expensive than the cable is rather questionable. In the first place, the copper in the conductors and feeders would cost more than the wire cables now in use. As far as the conduit is concerned it would cost as much or more to build than the cable conduit, for far greater precautions would have to be taken in its construction to ensure proper drainage and in insulating the conductor. The power station would have to be equipped not only with engines aggregating the same total horse power as now in use, but further with dynamos of practically the same capacity as the engines. Moreover, every car on the line would have to be equipped with motors, which would be another item of expense. On the other hand there is practically nothing to offset the increase of interest on the greater amount of capital invested. There is little or no saving in fuel, and consequently little saving in power.

With the conduit trolley system there is always the chance of a short circuit occurring, as happened recently on the new Madison Avenue line during a snow storm. The company stated that the trouble was due to the burning out of a plough. This may very possibly have been the case, but it is rather strange that this should have occurred during the first heavy snow storm that has visited the city this winter. Whether the trouble was due to the current passing from one side to the other of the plough, or whether it was due to the fact that the ground was covered with snow makes little difference—the short circuit occurred and disarranged the traffic for some time. We are curious to see what the next heavy snow storm will develop.

Col. N. H. Heft, the chief electrical engineer of the New York, New Haven & Hartford road, is said to have been well pleased with the behavior of the third rail system during this same snow storm. The New York Sun refers to the matter as follows:

"When morning came to-day every track was buried deeply in snow. Steam locomotives were sent out with the snow ploughs to clear the line between here and New Britain, and as soon as the tops of the rails were uncovered the electric current was turned on and trains were started at 9 o'clock. These trains have run all day, keeping close to their half-hourly schedule without difficulty, and the electrical engineers report that although all the rails were surrounded with snow there was no loss of current.

"On the Berlin branch, running from Berlin to New Britain, there were no snow ploughs sent out, but two or three trains were pushed over the line by steam locomotives, so as to uncover the rails, and then the electric cars were put to work and continued their trips all day."

The rather striking feature of the above account would seem to be the fact that if it had not been for the steam locomotives it would have been impossible to operate the road. And yet this severe test, as it is called, has been hailed by the General Electric Company and the officials of the road as proving beyond a doubt the capability of the third-rail system coping successfully with any kind of weather. According to this it will be seen that every third-rail system operating in the open will have to be equipped with a number of steam locomotives to clear the track of snow and keep it clear during the inclement season. We are obliged, of course, to accept the company's statement as to there not having been any loss of current when the conducting rail was surrounded with snow.

We do not wish to be misunderstood and have our readers infer that we are in any way opposed to electricity as a motive power where it can be utilized to advantage, but, as we have several times stated in our editorial columns, electricity has frequently been adopted by companies to supersede some other form of power, not on the score of economy, but for various exploitation purposes, or often as an excuse for watering the stock of a corporation.

Under the Searchlight.

Notes and Comments on Various Topics.

THE following taken from the New York Morning Telegraph describes one of the General Electric's methods of getting orders and quieting recalcitrant persons:

Ralph Beach, of General Electric, will go down to history as the greatest living exponent of the art of "jolly" known to the century. Few men can hold high-salaried positions because natural financial ability is supplemented by an infinite fund of tact in smoothing the wrinkles out of ill-tempered foreheads. Mr. Beach is the good fairy of General Electric. When everything is drifting in a direction that seems to threaten a wreck of worlds and crush of matter Mr. Beach is called upon to use his magic wand. He has never been known to fail in straightening out a tangle between the company and an exacting customer or to send away mollified the man who comes to the Edison Building bent on "cleaning out that nest of thieves." Mr. Beach has one trick, but he plays it for a big success every time. When a man says "d—n General Electric," Mr. Beach, instead of getting warm himself, says: "You're dead right, old man. To h—l with General Electric. The whole combination is as bad as leaky boots. The less you have to do with them the better." This is so different to what the angry man expects from a member of the executive force of the company that he is startled. Then it flatters him to feel that the other man so thoroughly agrees with him. He came braced up for a fight, but Mr. Beach's soft answer leaves him defenceless. Then comes the invitation to lunch, with wine and cigars, and later the executive force of General Electric chortles with glee as it listens to Mr. Beach's story and counts the profit on the additional order he has taken from the man who came to kill them all.

It is now universally conceded that many a true word is spoken in jest.

* * *

THERE are times when the Western Electrician is on the right side in General Electric news, but the following from their issue of February 5 is evidently a blunder or a joke:

The General Electric plant at Schenectady, N. Y., it is reported, is running day and night to keep up with the large amount of work on hand. The company's new fiscal year was begun February 1, with contracts aggregating \$21,000,000 and cash in the treasury of \$2,500,000, it is said.

The Western Electrician should have learned by this time through the columns of ELECTRICITY that the business done by the General Electric Company in the past two years has hardly amounted to \$24,000,000. Our Western contemporary evidently got this news item from a floating paragraph in one of the financial papers intimating that the G. E. Company had new business on hand at the commencement of the present fiscal year amounting to \$4,000,000. There is a wide difference between that figure and \$24,000,000—but what's the difference!

* * *

IT is stated that Marshalltown, Ia., is experimenting with a street-car motor that is expected to drive the trolley out of existence, or the enthusiastic papers of that city are much mistaken. It uses a combination of gasoline and storage batteries, is noiseless, is said to get there with all four of its wheels, and is in every way satisfactory as far as it has gone. It is in an experimental stage so far, and is having an average of two breakdowns a week, but the defects are being remedied, and then it is going to astonish the world, so the unsophisticated inhabitants of Marshalltown think.

* * *

MR. J. M. HILLS, who so ably represents the Bryan-Marsh Company in Chicago, has been in New York several days as the special envoy of the Northwestern Electrical Association to secure the co-operation of the Eastern central station men, manufacturers and dealers in the proposed trip of the Northwestern Association on the lakes immediately following the Convention of the National Electric Light Association in Chicago in June next. It is the intention to occupy four or five days on this trip, a fine steamer being chartered for the purpose. It will be obvious to every one who contemplates attending the June Convention that this will afford an excel-

lent opportunity to enjoy a healthful and delightful pleasure trip and cultivate social acquaintance with many persons worth knowing.

* * *

FOR weeks past the Alabama and Georgia telephone line passing through Mountainsboro has been cut by unknown parties, wires beat in two by rocks, and poles torn up. The matter was turned over to Deputy Sheriff Noel and he has been watching the line at different points. On a recent night Joe Chavies and Cisero Bruster, two young men, came up within a few feet of where the deputy sheriff was standing and soon had the pole down and the wire in two. They were arrested and carried to jail at Gadsden next morning. Some one asked them what they meant by such work; they replied, "Meanness, I reckon."

* * *

We gather from a Spanish paper that tenders for a direct cable from Spain to Cuba will most likely be advertised for this month. We trust that this proposed new connection between Spain and Cuba will be the means of more accurate war news being transmitted to the mother country and will be more successful than the other recent attempts at a conciliation or annihilation of the Cubans.

THE CALCULATIONS OF THE ELECTRICAL RESISTANCES OF ALLOYS AND THEIR APPLICATION TO THE FINDING OF ALLOYS OF DEFINITE ELECTRICAL PROPERTIES.*

BY C. LIEBENOW.

(Continued from page 69.)

The resistance of alloys made out of metals of the class A can therefore be very easily computed as the reciprocal value of the sum of the conductivities of the constituents.

$$R = \frac{1}{\frac{n}{r_1} + \frac{1-n}{r_2}}$$

In this equation r_1 and r_2 designate the resistances of the components of which n and $1-n$ parts respectively are contained in the alloy (n and $1-n$ expressed in parts of volume, the total volume taken as = 1).

For other alloys a second member has to be added on account of the thermo-electric force. The total expression is a very comprehensible form, viz.:

$$R = \frac{1}{\frac{n}{r_1} + \frac{1-n}{r_2}} \times \frac{1}{\frac{a_1}{n} + \frac{a_2}{1-n}}$$

which can be easily remembered. The equation contains four constant quantities: r_1 and r_2 are the resistances of the pure metals of which n and $1-n$, parts of volume, are alloys; a_1 and a_2 are two more constants which must be computed from the resistances of two alloys. If this has been done, the equation will give us a resistance of every alloy of any proportion.

If the fraction is reduced, the equation becomes one of the third degree with respect to n . If we therefore mark the resistances R as ordinates on cross-section paper, n the abscissas, we obtain a curve of the third degree, which has a maximum within the range to be considered.

I have tested the agreement of this curve with actual observations taken from a known series of experiments, and wish to demonstrate some of the same to you. This curve, Fig. 28, represents the gold-silver alloys. You will see that the curve rises rapidly in the beginning and continues to rise slowly and more slowly but finally falls down in a rapid

way. This shows that just a small percentage of one metal alloyed to another one causes a large change in the resistance. The resistance of silver increases with the addition of 1 per cent. of gold about 20

the first test of my theory the series of alloys of two rare metals, viz., the silver-gold alloys, as for this the conditions for absolute purity could be best fulfilled. You see here in Fig. 28 the result. The

FIG. 28.

per cent., and in the same way the resistance of gold increases by the addition of 1 per cent. silver 16 per cent., notwithstanding silver is a much better conductor than gold. Small percentages of carbon,

measurements applied were made forty years ago by Matthiessen and Holzmann. These scientists determined the conductivity of eighteen gold-silver alloys at ordinary temperature, which was in every

FIG. 29.

phosphorus or any oxide has still a much more marked influence upon the resistances of metals. You can apprehend from this how important exact measurements are if you desire to have the metals exceedingly pure. On account of this I selected for

case carefully noted. They used the conductivity of pure silver at zero degree centigrade as unit.

I reduced the data to ohms at 0° C. and marked them as crosses in the cross-section paper, using the resistances as ordinates and the volume per cent. of

*Paper read before the Elektrotechnischen Verein on Nov. 23, 1897. (Translated for ELECTRICITY.)

gold as abscissas. From this data of measurements I have computed the constants a_1 and a_2 , as 2.70 and 3.09, whereas the specific resistance of gold is .021326 and of silver .015623; the formula for the gold-silver alloy is therefore, if we express n not in parts of the total but in per cent., as follows:

$$R_0 = \frac{1}{\frac{\% \text{ gold}}{2.1436} \times \frac{\% \text{ silver}}{1.5623}} \times \frac{1}{\frac{270}{\% \text{ gold}} \times \frac{309}{\% \text{ silver}}}$$

Out of this formula I have computed the resistances for alloys varying from 5 to 5 per cent. in gold. These values I have connected by a curve as shown in Fig. 28. I must confess that the agreement between the observed and computed values has widely surpassed my expectations. The observed data are falling almost without exception within the line of curve.

The observations therefore have verified the correctness of the formula.

In Fig. 29 you will see the series for the gold-copper alloys. The agreement is not quite as good, but as cast copper very easily becomes porous, slight de-

times it disappears entirely, and sometimes it becomes even negative.

We will probably make no mistake in assuming that all four constants of our equation will be in some way influenced by temperature. For the two first ones, viz., τ_1 and τ_2 , as already mentioned, the above named coefficient holds good. For the other two constants in the second member of the equation the influence of temperature is however very small, indeed so small that I have succeeded as yet in finding it for copper only. In all other cases it is not noticeable, and in general can be neglected.

If, for the sake of simplicity, we designate the first fraction in the above equation as A and the second fraction as B , we will get for the approximate value

$$R(1 + \gamma t) = A(1 + \alpha t) + B.$$

Here γ designates the temperature coefficient of the alloy and $\alpha = 0.004$. If we solve this equation with respect to γ we get

$$\gamma = \frac{A}{R} \alpha$$

According to this formula the temperature co-

metals undergoes when two of them are alloyed stand in close agreement with our other experiences, without having to resort to the assumption of metal compounds.

We will now turn our attention for a short time to the other changed physical properties, and we will consider how other substances behave if mixed. We will pour together two liquids which will mix with each other in any proportion. We will take 50 liters of water and 50 liters of alcohol, pour them together in a 100 liter vessel and stir the mixture well. The result will be that we will not have 100 liters of mixture but only 97 liters. Now what is the cause of this contraction? Modern physics teaches that liquids are nothing else than compressed gases which stand under a very high internal pressure acting normally to their surfaces. This pressure is the result of forces acting between the single molecules. We could designate it as a pressure of cohesion. In the interior of the liquid this pressure is acting upon the molecules uniformly from all sides, but on the surface it is one-sided, acting towards the interior. It is as if the uppermost skin of the liquid compresses the body of the liquid. And this pressure amounts to about 2,400 atmospheres for alcohol at 0° C. and to about 10,700 atmospheres for water. When we mix alcohol with water, then not only do alcohol molecules come in contact with alcohol molecules, and water molecules with water molecules, but alcohol molecules come also with water molecules in counter action, and the total pressure of cohesion changes its value. If we had separated in a cylinder the 50 liters of water and the 50 liters of alcohol by a loose membrane, so that one liquid was above the other, and we wished to compress the 100 liters to 97 liters by the aid of a hydraulic press, it would certainly require a pressure higher than 1,000 atmospheres.

Such an increase of the pressure on the surface must be accounted for by the interaction of the molecules of water and alcohol in the mixture. This increase, which the molecules are causing apparently with such little effort, has nevertheless the same effect on the liquid as we could accomplish only by means of sufficient hydraulic pressure. Similar changes in the pressure of cohesion may be expected when we mix two molten metals together.

But also in the solid state there must be forces acting of similar magnitude; and there may be in many alloys a much higher pressure acting normally to their surfaces than are acting in their constituents.

It is well known to you that ice, for example, will melt at a lower temperature than the normal temperature 0° C. if under the influence of higher pressure, and in general the melting point changes with the pressure. If we consider this fact, the changes in melting points of alloys do not seem to be exceptional. The same consideration explains their changed specific weight, their high tensile strength and the high luster often found in alloys. The metals in alloys often behave, not only as if they were hammered together with heavy steam hammers, but the increased pressure of cohesion remains permanently. It may be well to mention, however, that this pressure may occasionally become smaller after the alloying of the metals than the mean of the constituents would indicate. The assumption of new metallic compounds with absolutely new properties seems therefore entirely superfluous so far as all cases yet mentioned are concerned.

Does it not seem probable, therefore, that chemical compounds of two metals do not exist?

(To be continued.)

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

FIG. 30.

viations must be expected. The curve is computed from the formula:

$$R_0 = \frac{1}{\frac{\% \text{ gold}}{2.1436} \times \frac{\% \text{ copper}}{1.677}} \times \frac{1}{\frac{390}{\% \text{ gold}} \times \frac{195}{\% \text{ copper}}}$$

The constants of the second member I have rounded off, leaving it for the future to correct them still further. It is remarkable, that the constant for gold is exactly twice as large as the one for copper. In other cases I have found mostly simple ratios. This however seems to be incidental only to silver and gold, for which the best series of observations are at hand.

If we give our attention to a factor which plays a very important part in the resistance of metals, viz., the temperature coefficient of resistance, we find that this coefficient is much more influenced by the alloying of metals, as already mentioned, than the resistance itself. Temperature variations, as is well known, have a very marked influence on the resistance of pure metals. The average coefficient is about 0.004, which means that if the resistance of a metal at 0° C. equals 1, this resistance will be at a temperature t ° C., about equal to $1 + .004t$.

If, however, we alloy two metals, the temperature coefficient becomes in most cases very small—some-

efficient of most of the alloys can be very closely computed. I have found as yet that only alloys containing copper show a noticeable discrepancy, and the reason for this is due to the fact that copper changes its internal molecular conductivity for heat considerably with change in temperature. If this conductivity at 0° C. equals 1, it is at t ° C. equal to $1 + .0006t$.

This coefficient I have determined from a series of observations made by Feussner upon copper-nickel alloys. The alloys were made by the firm of Basse & Selve, of Altena, Westphalia. They contained, however, according to Dr. Feussner's analysis, impurities of iron, manganese, zinc, etc., in sufficient quantities as not to be negligible for our purpose. The agreement between calculation and observation, Fig. 30, is nevertheless satisfactory, and it shows that a negative temperature coefficient of such alloys is explainable by our theory. The formula for the copper-nickel alloys is the following:

$$R_0(1 + \gamma t) = \frac{1 + 0.004t}{\frac{\% \text{ Ni}}{1.3} + \frac{\% \text{ Cu}}{1.82}} + \frac{1}{\frac{62}{\% \text{ Ni}} + \frac{41.3(1 + 0.0006t)}{\% \text{ Cu}}}$$

We see, therefore, that the herein shown remarkable changes which the electrical resistance of

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES OF EUROPE.

BY JOHN B. C. KERSHAW, F. I. C. (LONDON).

Chapter XIV.—Ozone.

The production of ozone upon an industrial scale by means of the silent discharge of alternating currents of electricity at high potential, has been attracting during recent years considerable attention from electricians and chemists in Europe. Though up to the present date the instances in which ozone, or ozonized air, is being produced and applied to industrial purposes upon a business basis are few, yet one or two such commercial installations exist. The possibilities of advance both as regards the more economical production of ozone by the electrostatic method and the widening of its field of application are also hopeful, and therefore some account of the process and apparatus used to produce the ozone, and of its applications both actual and suggested may rightly be considered to be within the scope of these chapters.

Ozone production is not yet an industry; but it is one of those newer branches of electro-chemical progress which may show startling developments in future years; and the record of past progress and present achievement is certainly worthy of the attention of readers of *ELECTRICITY*.

Chemical Properties.—Ozone is a gas and is a condensed form of oxygen, three atoms of oxygen being contained within the molecule of ozone, as opposed to the two atoms which form the molecule of ordinary oxygen. The chemist is accustomed to picture the molecules of oxygen and of ozone to himself by the following graphic formulae, in which the circles represent atoms of oxygen, and the straight lines the chemical bonds or affinities:

The extremely active oxidizing and disinfecting properties of ozone are due to the ease with which it gives up its third atom of oxygen and reverts to the ordinary molecule of oxygen containing only 2 atoms. This liberated single atom of oxygen is in what chemists describe as the nascent condition, and in this state it can effect chemical changes impossible to the ordinary molecule of oxygen.

In calculating the oxidizing or bleaching effects that may be expected from the action of a given quantity of ozone, it is necessary to remember that only one-third of its oxygen is effective.† The ozonized air produced by the forms of apparatus described in these chapters rarely contains more than 5 per cent. ozone, and it therefore follows that the effective oxygen it contains seldom exceeds 1.7 per cent. This very dilute mixture of ozone with ordinary air is however a very efficient bleaching and sterilizing agent. The presence of ozone in air is generally revealed by a sharp, pungent odor not unlike that of air containing a small percentage of chlorine. If a piece of filter paper moistened with a solution of starch containing potassium iodide be brought into ozonized air, a gradually deepening purple stain is produced upon it due to the liberation of the iodine and to the formation of purple iodide of starch. This is the most simple and most delicate test for the detection of ozone in air.

There are three different methods by which oxygen can be converted into ozone. If a stick of phosphorus be left in a closed bottle half filled with water for several days, ozone will be found in the enclosed air. This is the chemical method. If a solution of sulphuric acid in water be electrolyzed with platinum or gold electrodes, ozone will be found at the surface of the anode. This is the electrolytic method. If electricity at high potential be dis-

charged through air, ozone will again be produced. This is the electrostatic method. Whenever a frictional electrical machine is worked, small quantities of ozone are produced, and their presence may be easily detected by one's nose. Although ozone can be produced by the three methods described above, the industrial production of ozone has only been attempted by the latter method. One of the first forms of ozonizer based upon use of the silent electrostatic discharge was that designed by Werner von Siemens in the year 1857‡, and all later forms are merely modifications of this earliest apparatus.

Siemens' ozonizer consisted of two concentric glass tubes. The inner tube was provided with an inner covering of tin-foil, while the outer was provided with an outside covering of the same. The tin-foil coatings were connected to the opposite poles of a source of high tension electricity, and air was passed through the annular space between the two glass tubes. Although a very large number of modifications of this original ozonizer have been patented, only four of these need claim special attention.

The Andreoli Ozonizer.—This ozonizer consists of alternate parallel surfaces of metal and of a dielectric. The metal electrodes are long narrow boxes, and water or some other cooling fluid is circulated through them in order to keep down the temperature, heating being one of the chief obstacles to good work in all forms of ozonizer.‡ The metal surfaces are covered with points to facilitate discharge of the electricity, there being 46 rows of points to the square foot. Andreoli states that an ozonizer possessing 12 metal electrodes would possess 53,760 points. These hollow point-bearing electrodes act on both surfaces, and are connected alternately to the poles of the high-tension transformer. This form of ozonizer, in which only one dielectric surface separates the metal electrodes, and in which the ozonized air is therefore in direct contact with the metal, is called by Andreoli an "open ozonizer," in contradistinction to those forms possessing two dielectric surfaces, which he calls "closed ozonizers." The oxidation of the metal is stated to be slight, and the gain in efficiency that results from dispensing with one dielectric surface between each pair of electrodes is stated to be considerable. This "open ozonizer" has yielded 35 grams ozone per E.H.P. hour in continuous work, while for short periods a yield of 48 grams has been obtained. Alternating currents of 10,000 volts have been used in the experimental work. Andreoli states that the maintenance of a low temperature and the quick withdrawal of the ozonized air from the apparatus are the chief conditions of good work. Further details of this apparatus, and of Andreoli's views upon the theory of the silent electrostatic discharge, will be found in the article named below.‡ Mr. Edward Beanes, who experimented in this field some years ago, has recently been controverting Andreoli's assertion that points increase the efficiency of the ozonizer. He asserts that the direct opposite is true, and states that even the air ought to be filtered through cotton-wool before entering the ozonizer in order to remove particles of dust which might otherwise settle on the metal plates and act as points. Those who wish to follow the discussion that is now being carried on between these two disputants are referred to the papers mentioned below.‡

The Andreoli open ozonizer has been at work for a considerable period at the works of Messrs. Allen & Hanbury, manufacturing chemists, London; the ozonized air produced here was used chiefly for bleaching and thickening oils. The patents are now owned by a small syndicate, who are seeking to extend the commercial applications of ozone and ozonized air.

‡ *Popp. Ann. Phys. Chem.*, 1857.

† Ozone is a very unstable form of oxygen, and mere heating is sufficient to cause its reversion to the ordinary form.

‡ *Jour. Soc. Chem. Ind.*, Vol. XVI, p. 393. *Electrical Review* (London), December, 1897.

The Tindal and Van der Steen Ozonizer.—This form of ozonizer has been at work for a considerable period in Paris, in connection with experiments upon the sterilization of Seine water. The results obtained in the first series of experiments were sufficiently promising to lead to the renewal of the concession from the Paris municipality for another three months.

The writer has not been able to obtain from Baron Tindal any details of the form of ozonizer used at Paris, or of the actual output of ozone per E.H.P. hour, although he applied some months ago for information. The water is sterilized by passing through towers containing perforated plates or coke, in which it meets with the ozonized air. The ozone produced by 1 E.H.P. hour is stated to be sufficient to sterilize 5,000 liters of water. This method of water purification is also receiving trial in Calcutta, a plant valued at \$24,000 having been prepared and sent out by the British Electro-Ozone Corporation of London in the summer of 1897.

The Yarnold Ozonizer.—A third form of ozonizer that has received trial upon a scale approximating to those of actual industrial operations is that patented by Yarnold and protected by British patents Nos. 2,488 of 1894 and 24,289 of 1895.

The form described in the first patent consists of a box filled with glass plates, the alternate ones coated on one side with gold leaf. These latter are connected to the poles of the transformer, alternate plates being connected to the positive and negative poles. Oxygen, or air, is passed through the spaces between the plates when the apparatus is at work.

With this form of ozonizer the inventor recommended alternating currents of 125 frequency and 50 volts; in his later patent he recommends 12,000 volts. The experimental plant now at work is stated to be yielding 1,800 to 2,000 cubic feet of ozonized air per hour, but the percentage of ozone in this air is not given.

The cost of a plant capable of producing 10,000 cubic feet of ozonized air per hour is given as \$6,240, and the cost of running it with electrical energy at 8 cents per kilowatt hour is estimated to be under 1 cent per 1,000 cubic feet of ozonized air produced. The experiments conducted with this form of ozonizer during the continuous run trial of nine months to which it has been subjected, have related to the use of the ozonized air for sweetening foul beer-casks, the drying and thickening of linseed oil, the seasoning of linoleum, and the production of hydrogen peroxide.

The Siemens & Halske Ozonizer.—This form of ozonizer has been at work since the year 1894 at a bleaching works at Greiffenberg in Germany, where the ozonized air is used in conjunction with a weak solution of hypochlorites for bleaching purposes. It is a curious fact that the bleaching of linen fabrics or cotton goods cannot be effected by the use of ozone alone, but that when chlorine and ozone are used alternately most excellent bleaching results are obtained.

The Siemens & Halske form of ozonizer consists of a metal inner tube enclosed in a larger glass tube, covered on its outer side with tin-foil. Since there is only one dielectric surface between the two metal surfaces, it is what Andreoli would term an open ozonizer. Water is circulated through the inner tube, and air or oxygen through the space between the two tubes. A number of these single ozonizers are combined to form a "tube-trellis." Dr. Fröhlich reports that this ozonizer produces 20 grams ozone per E.H.P. hour, a quantity sufficient to bleach 50 kgs. linen yarn or 40 kgs. potato starch. This ozonizer is used at Kyritz for the latter purpose, and is understood to be giving satisfactory results.

Other Applications.—Purposes for which ozonized air has been used, in addition to those mentioned above, are the ageing of wood for the manufacture of musical instruments, the ageing of whiskey, and the manufacture of artificial perfumes.

At one time it was hoped that a very wide field of usefulness would result from the applications of

† Dr. Thorne states that under certain conditions the whole of the oxygen enters into reaction. *Jour. Soc. Chem. Ind.*, Vol. XVI, p. 94.

ozonized air in the sugar industry, but the experiments carried out a few years ago have not justified these hopes. The great activity of ozone as a bleaching or oxidizing agent, while in some cases it favors its use, is in other cases the very property that prevents its employment. In the case both of sugars and of spirits or wines, the constituents are all oxidizable chemical compounds, and there is great danger that when these bodies are brought into contact with ozone or ozonized air other compounds than the impurities or coloring matters will be oxidized and converted into useless compounds. The slow methods of oxidation hitherto used in these industries have therefore one very decided advantage on their side, and on account of this absence of any danger of over-oxidation the writer doubts whether methods based upon the use of ozone will ever displace them. But there are many other fields of application in which there are no such limitations, and in these the question of the adoption of ozonized air as a bleaching or disinfecting agent is simply a question of cost. Of these the sterilization of drinking water is undoubtedly one of the most important, while the sweetening of sour beer-casks is another field in which considerable developments might be expected.

The Future.—It is evident that if ozonized air can be produced sufficiently cheaply there are numberless directions in which it can be advantageously employed. The progress of this industry in the future therefore depends chiefly upon the advances made in improving the yield, and the durability, of ozonizers. Otto† in a recent paper has stated that the potential and dielectrics used in the usual forms of ozonizer are not those which give the best results. In the form designed by himself he states that he has obtained an output of 150 grams ozone per EHP. hour by using a lower potential and alternating currents with a periodicity of 80 per second. The theoretical yield is stated to be 1,000 grams ozone per EHP. hour, and the efficiency of Otto's ozonizer is thus 15 per cent., as compared with 2 per cent. of Siemens & Halske's ozonizer, or the 3.5 per cent. obtained in the open ozonizer of Andreoli. The differences of opinion that exist between Beanes and Andreoli, and between Otto and all previous inventors, upon fundamental principles of the construction or working of ozonizers, would seem to indicate that inventors have not yet exhausted the possibilities of economical ozone production. The experiments that are now being carried on in many quarters will therefore no doubt lead to an improvement in the yield of ozone per EHP. hour, and consequently to a decided reduction in the cost of ozonized air per 1,000 cubic feet.

The Patent Office Behind in Its Work.

We learn from a Washington contributor that a deplorable condition of affairs exists in the United States Patent Office, due to the smallness of the working force, and the situation is becoming more serious every day. The examiners are from three to four months behind in their work, and some divisions of the office are as much as six months behind. There are on hand in round numbers awaiting action 13,000 cases, of which 9,600 have never been looked at, and it is probable that in the next four months the business will largely increase. March, April, May and June have heretofore been the heaviest months of the year, and there is no reason to doubt that the record will be kept up. The officials estimate that in that time 14,000 new cases will be received.

The applicants for patents are protesting against this delay. They claim they are entitled to prompt and efficient service. The Government requires them to pay for the work in advance, and then they are obliged to wait for months before having their applications attended to. One thing is certain, the efficiency of the Patent Office demands, in the interest of its clients, a suitable force of employees to prosecute the work intrusted to it.

TOPICS OF INTEREST TO CENTRAL STATION MEN.*

BY LIEUT. FRANCIS A. BADT.

Mr. Chairman and gentlemen: When I got to Milwaukee yesterday I found to my surprise my name on the programme, stating that I would deliver an address on the subject of "Topics of Interest to Central Station Men." Now as a matter of fact I had simply asked for the privilege of saying a few words extemporaneously, to get acquainted with all of you, as this is my first appearance before this august body.

I read about twenty years ago, I believe, that a good extemporaneous speech should fulfil about twenty-four conditions. Now I have forgotten twenty-three of them, but I remember one, and that is that a good extemporaneous speech should not last over fifteen minutes, and in that respect you will note the difference between my short address and that of my friend Dow, who unfortunately is not here this morning. I would like to get back at him concerning a few remarks he made yesterday.

Mr. Dow brought up one subject, and that is the old, old subject of alternating currents vs. direct currents. My friend George Cutter and I discussed that fifteen or sixteen years ago at the old Chicago Electric Club, and the subject has been brought up time and again, and I think now that it is the universal opinion of engineers and such managers of central stations as have had an experience in both lines that where the conditions are favorable to the direct-current system it has great advantages in some respects over the alternating system, but that, however, in certain cases an alternating system must be installed, as a direct-current system will not reach the distances.

For the last four years I have been one of the many advocates of the straight 220-volt direct-current system, and when we commenced about four years ago to get lamp manufacturers to make us 220-volt lamps, they all declared it could not be done, the thing was not practicable, it would not pay them, and they wanted to know how many lamps we could order, and one thing and another; and in short we had almost to coerce them into making us 220-volt lamps, and I find to-day—and I feel very good over it—looking over the electrical papers, that a good many manufacturers advertise 220-volt lamps as a specialty. In other words, it has become a commercial article.

The advantages of the straight current 220-volt system are many. You all know that the Edison three-wire patent which was mentioned by Mr. Dow expires, if my memory does not fail me, in the spring of 1901; and it was one of the main reasons of getting a straight 220-volt system to avoid infringing on the Edison three-wire patent. Of course a straight 220-volt system is really simpler than the Edison three-wire system, necessitating only one dynamo, doing away with neutral wire, with balancing devices to keep the two sides of the three-wire system at proper voltages, etc. Now, setting aside the patent question entirely, a 220-volt system is much more easily managed than a three-wire system. It costs less to install it; it costs less to maintain it, if proper caution is used. We have to-day, as I stated before, 220-volt incandescent lamps, and within the last few months an arc lamp has been developed, not by one company but by a number of companies, an enclosed arc lamp of course, which will burn singly across 220 volts. You all know that a 220-volt direct-current motor has many advantages over a 120-volt motor, so that we may say that in the 220-volt direct-current system we have a good system for small central stations where moderate distances are to be met, say three-fourths of a mile radius from the station. The 220-volt arc lamp is probably known to many of you. It is a lamp which at nominal 2,000 candle-

power uses two and one-half amperes and consumes about 160 volts in the arc. The arc is three-fourths of an inch long. Of course the advantage of such a lamp overrunning two or three lamps in series is evident. You can supply a customer with one lamp without making that lamp depend upon somebody else's lamp, doing away with all series connections. You have a lamp which practically casts no shadow. Take an arc three quarters of an inch long and it does entirely away with shadows cast from the carbon tips. In short, I think that such a combination of 220-volt lamps, 220-volt arcs and 220-volt motors presents a very simple system and a system which I think, properly operated, will likewise earn money.

For isolated plants the 220-volt system will of course only be used where there is a good deal of motor service. Now take the elevator service which Mr. Dow mentioned as probably the severest service that can be had, the 220-volt arc has again the great advantage that great fluctuations in the power circuit will not be noticeable in the arc. You take an arc of 160-volt difference of potential, an arc three-quarters of an inch long, and it will practically not be affected by a variation in the power circuit of, say, 50 volts. Now there again is an advantage even in an Edison three-wire system of the 220-volt arc against two 100-volt arcs. In the Edison three-wire system of course the fluctuations on each side will be greater than the fluctuations of electromotive force on the outside wires. The balancing requires some attention, and often it happens that one side has more electromotive force than the other. Now if the electromotive force of the outside wire is kept fairly steady, you get of course less variations there than on either side, and a 220-volt arc will give better satisfaction.

The enclosed arc lamp itself has made great strides during the last few months towards perfection. Our friends on the other side of the water have declared time and again, and have proven it to us mathematically, that the enclosed arc is no good; that the open arc is of greater efficiency and has many advantages over the enclosed arc; but in spite of these theoretical demonstrations the enclosed arc is the arc to-day in the United States, and the open arc for constant potential circuits is getting out of vogue entirely. It is a back number, and gives us one of the illustrations where theory and practice do not coincide. The American is, if anything, practical, and if the great public here decides that the enclosed arc is the thing they want, it is the thing they must have, in spite of theory and efficiency or anything else. I think that it will not be very long when we will have an enclosed arc of 500 volts to be attached directly across the wires of a railway circuit. Now, there again such an arc will have great advantages over the old method of running from five to ten lamps in series, one lamp depending on the other, making the mechanism more complicated on account of outouts, extra resistance, etc.; and again, an arc of say 450 volts difference of potential will stand great fluctuations. Now the fluctuations in the railway circuit may be 100 volts or more, and while an arc of 450 volts will stand that, lamps five or ten in series will be seriously affected by such fluctuations. I think the solution of the question of a good practical lamp—never mind the efficiency—for railway circuits will be found in the enclosed arc lamp burning across 500 volts.

There is another little matter that I should like to mention in connection with the enclosed arc lamp, and that is the gas cap, as it is usually called—that is to say, the cover for the inside cylinder through which the upper carbon passes. That gas cap has got to have an opening of course through which the carbon passes. Now most of the enclosed arc lamps use what is commercially called a half-inch carbon. I have calipered a few hundred of them and find that they vary from 25-1000 of an inch below to 25-1000 of an inch above the standard half inch. You can easily see that one of the require-

* Address before the Northwestern Electrical Association, Milwaukee, Wis., January 19, 1898.

ments of an enclosed arc lamp is to have the carbon fit as tightly through the hole as possible, to prevent the outside air from getting into the cylinder. Now if the carbon is a little too large it will stick; again, if the carbon is too small, too much air will follow into the opening and the lamp won't last the guaranteed lifetime, 150 or 170 hours, whatever it may be.

Now I have also found that the different manufacturers of enclosed arc lamps—I think there are about twenty in the United States now—have not adopted the same diameter for the opening of the gas cap. The diameters vary from exactly half an inch to about 18-1000 of an inch above half an inch. Now taking that in connection with the variations in the diameters of carbons and you can see that a man who has a few hundred enclosed arc lamps, or less, and buys carbons indiscriminately without ascertaining the diameter, may have considerable trouble; and I would suggest that this Association take up the subject of standardizing the diameter of the hole in the gas cap and urge the manufacturers of enclosed arc lamps to adopt one standard. If that is adopted, then of course the carbon manufacturers could be compelled to furnish carbon within certain limits.

Of course it is impossible to have all carbons absolutely of the same diameter, because there is more or less shrinkage in the baking, but we could get so near to that standard that all the troubles as they exist now would be avoided. All this refers to the direct-current system of course.

Now, as to the alternating system, my opinion is that the single-phase system will eventually be the system. It recommends itself for its simplicity, and I think it will not be long now before we have any number of different makes of single-phase motors in the market. We have now, of course, incandescent lamps burning on alternating currents; we have alternating arc lamps; we have finally gotten a few alternating enclosed arc lamps that are good and give a light of about 100 hours with one dipping of 12 inch carbon; and if we get the single-phase motor I think we will have the system for stations that cannot avail themselves of the advantages of the direct-current system—in other words, where conditions are such that you have to cover large areas and have to use high tension primaries and low tension secondaries.

Mr. Dow mentioned one objection to alternating systems, namely that each customer had to have a transformer for the maximum capacity of the dwelling or whatever it might be, and he cited that as a great disadvantage of the alternating system as against the direct-current system. Now, I think that a good deal of that could be avoided in the alternating system by using larger transformers for a number of customers. Of course you could not do it economically with 50-volt lamps; you might not be able to do it economically with 110-volt lamps; but why not use 220-volt lamps? There again, I think, is a new field for the 220-volt lamp. Use large transformers, take one transformer, if possible, for a block, and then wire the block on the 220-volt system and use 220-volt translating devices, so that you get efficiency out of your transformer, and that will avoid the necessity of using a large number of small transformers, which of course means a good deal of money invested, low efficiency, etc.

Before I close I should like to draw your attention to something that is not exactly electrical, but in which we are all interested, and that is the heat engine. You probably are aware of the fact that the best type of modern stationary steam engine only yields us power equivalent to say about 13 per cent. of the energy which we find in good steam coal—in other words, there is 87 per cent. left for improvement. Compare that, for instance, with the dynamo where manufacturers guarantee 95 and 96 per cent. efficiency, and you see that we have not got very far as far as efficiency goes in steam engines for a century. Now the steam engine of the future will have

a much higher efficiency, of course. It will do away entirely with boilers. It will be a steam engine that burns the fuel—no explosions, but burns the fuel, either powdered coal dust or oil, in the engine. I am not guessing here, but I am just describing an engine which is now on exhibition on the other side of the water, and I know that a number of American capitalists are over there now trying to buy the patents. That will be the steam engine of the future. It will be an engine without boilers, gentlemen, and no explosions as in the gas engine, but burning fuel in the engine and utilizing it for power. Now you can all figure out for yourselves what a revolution in steam engineering such an engine would produce, and it looks ridiculous to me when I see in papers in Chicago statements made by one of our great street railway magnates there that his franchises will last forever, no matter what the city government may do, that they will last just as long as the present power is any good. Just as soon as we can do away with tracks in the streets and employ modern means of locomotion his franchise won't be worth a nickel. The American city of the future, as it appears before me, is a city without street-car tracks, with streets well paved with asphaltum or something similar, and motor cycles and motor buses passing in all directions on those pavements, and I think that the new engine will help us to realize this ideal. If we have the engine as described before, we can make a locomotive that will do all that I have just stated. Of course it is hard to tell what the future will bring us, but I am convinced that we will have better streets in the future than we have to-day.

TESTS ON THE ENGLEWOOD AND CHICAGO ELECTRIC STORAGE BATTERY ROAD.

A large number of tests were recently made of Chicago's storage battery road with a view of ascertaining the exact cost of operating such a system.

These tests were put in charge of Mr. George A. Damon, who was ably assisted by Prof. T. P. Gaylord and a corps of students from the Armour Institute.

The boiler plant of this road consists of three Heine water-tube boilers rated at 200 boiler horse power each, fitted with Roney mechanical stokers. The engines are triple expansion condensing, of the Willans central-valve type. The plant at present contains two of these engines. Each engine has two lines of tandem cylinders, and is rated at 200 horse power at a speed of 380 revolutions per minute.

The engines are directly connected by means of the "Arnold system" to four six-pole shunt-wound Walker power generators, rated at 190 kilowatts each when running at 380 turns per minute. They are designed to deliver their rated output at a voltage varying between 160 and 190 volts.

Each engine exhausts into a jet condenser, from which the condensed steam and heated injection water is raised by means of the air pump about 35 feet to the top of a cooling tower, in the bottom of which it collects ready to be again used in the condenser.

The boiler-feed pumps are of the duplex compound type, and ordinarily take their supply from the well of the cooling tower, pumping it through a closed feed-water heater in the exhaust line of the pumps and thence through the economizer to a common feed-water header above the boilers.

The hot flue gases from the boilers pass from the uptakes into a brick smoke flue extending the entire length of the boiler room. The economizer consists of eight rows of 24 pipes each, making a total of 192 pipes.

The stack is self-supporting and is constructed of steel. It is 150 feet high and 7 feet in diameter.

In making the tests water was measured by means of three tanks just before it entered the feed pumps. The steam used by the stoker engine, by the economizer engine, by the calorimeters, by the

feed pump and by the air pump was condensed and carefully measured. The blow-off from the boilers and other unused piping was opened up to guard against the water escaping through unknown leaks. All water not accounted for by the auxiliaries was charged against the engines, with the exception of a liberal allowance for leakage in the live-steam line.

All scales, steam gauges, thermometers, indicator springs, electrical and other instruments used were carefully calibrated.

The first test was with the plant running with two boilers, two engines and three generators. The second test was with practically the same load, carried by one boiler, one engine and two generators, while the last test was made under practically the same conditions as the second test, with the exception that the three-voltage method of charging the batteries was abandoned. In this test but one generator was used and the batteries were charged in successive sets, all at a common potential, the voltage being raised as the batteries became charged in such a way that the load upon the generator was kept nearly constant.

The coal used was from Fairmount, W. Va., and cost, delivered at the power house, \$1.90 per ton. An average of five determinations of its calorific value by the Berthier method gave 10,145 British thermal units per pound. The average of six analyses give the following result:

Moisture.....	6.326 per cent.
Volatiles and combustibles.....	32.903 "
Fixed carbon.....	48.126 "
Sulphur.....	2.700 "
Ash.....	10.030 "

In the first power house test the average steam pressure by gauge was 168.3 lbs. The trial lasted nine hours, during which 7,000 pounds of coal was burned and 43,323 pounds of water evaporated. The water evaporated per pound of fuel from and at 212° was 8.22 pounds, the percentage of the total calorific power of fuel utilized being 62.86. The maximum indicated horse power of the engine was 246 and the minimum 202, the average indicated horse power being 217. The gauge pressure showed an average of 171.3 pounds.

The test showed that the engines used 18 pounds of steam per indicated horse power. The conditions of the test were not favorable, however, to either an accurate engine test or to the most economical operation of the engines. The steam pressure was lower than it should have been, while the vacuum was but 21.25 inches. The engines were also overloaded during the entire run and were operated at 363 instead of 380 revolutions per minute.

The average efficiency between the horse power developed in the cylinders and the electrical power delivered on the switchboard was shown to be 79.27 per cent., the watt hours per pound of coal being 155.2, making the cost of coal per net kilowatt hour at the switchboard .611 cent. This high price is to be explained, not by the inefficiency of the station, but by the fact that a high price is paid for a poor coal. With a more advantageous arrangement in the purchase of coal, there is no reason why this station should not develop a kilowatt-hour for less than .3 cent.

The pumps used 14.36 per cent. of the water evaporated by the boilers, this not being however a total loss as the exhaust was used for heating the feed water. A friction load of 32.26 indicated horse power was shown with one engine operating one generator running on open circuit.

The efficiency of the battery is shown as follows:

Kilowatt-hours, first charge.....	30.757
Kilowatt-hours, discharge.....	19.715
Kilowatt-hours, second charge.....	81.631

The efficiency in the first case is 53.6 per cent. and in the second 62.32 per cent. As is shown above, the two charges differ considerably.

This is due to the fact that the charging of the battery was left to the regular operators of the plant, who used their judgment both as to the voltage and as to the time the battery should charge at each volt.

age. They also determined when the battery was fully charged. In the first charge there is no doubt but that the final voltage was too high, and in the second charge it would seem that the battery was charged too long, both of which conditions reduced the efficiency obtained. The result, however, shows the efficiency in actual service, but does not represent the possibilities of the battery.

The amount of the first charge was, of course, influenced by the immediate previous history of the battery, and for this reason the efficiency obtained by using the second charge as a basis is the more reliable. The test showed that the car used 1.41 kilowatt-hours per car-mile, as measured at the charging table, and .87 kilowatt-hour per car-mile was delivered from the batteries to the motor on the car.

The acceleration test showed a speed of 4 miles per hour five seconds after starting, 8 miles per hour ten seconds after starting, and 15 miles per hour one minute after starting, the maximum amount of current used being 320 amperes. Four sets of batteries were, however, in use at that time in parallel, so that this total of 320 amperes indicated a total discharge rate of each cell of but 80 amperes.

In conclusion it may be said that the foregoing tests do not demonstrate the best results that may be expected of accumulator traction, and were not made for that purpose. No excuse is to be offered for the fact that the road was not operating under ideal conditions while being tested, as the primary object of the test was to determine where improvements could be made. If this is kept in mind when comparing the results with those obtained upon the trolley systems of about the same size, it will be seen that the cost of fuel for accumulator traction of something less than one cent per car-mile is very favorable to storage-battery traction.

The batteries have operated from eight to fourteen thousand miles and are said to be standing the service remarkably well.

Magnetic Wind.

The explanation of the phenomenon of "electric wind," meaning the discharge from points accompanied by a blast of air, says the *London Electrician*, has taxed the successive theories of electric discharge to the utmost. That air can be electrified has been generally denied by the more recent workers, and the effect upon air has, since Helmholtz, been attributed to a dissociation of the gaseous molecules. Unless a higher than atomic dissociation is assumed, this hypothesis meets with serious difficulties in the case of monatomic gases. There remain the wave theories sketched out by Hertz, Goldstein and others, which embrace all vacuum discharges. But O. Lehmann has recently carried out an investigation of the phenomena of electric and "magnetic" wind, which tends to put these theories out of court.

It appears that the air currents between two opposed points, made visible by tobacco smoke or by a heavier gas, can be explained by the projection of two opposed currents of particles or ions, which produce a motionless layer in the middle. If for any reason a layer of air requires a different dielectric capacity from the rest, partial discharge takes place within it, which gives the appearance of a stratified discharge. Electric wind is the cause of the unsymmetrical shape of the arc, which is blown away from the negative pole. If the electric wind occurs in a strong magnetic field the stream lines of the ions, and hence also of the air, must be changed in obedience to the electromagnetic forces, since a moving ion is equivalent to an electric current.

This may be well shown by means of the arc, which rotates in a magnetic field originally devised by Andrews. One of the poles is a plate with a circular perforation, the other is a carbon rod with its end in the center of the circle. The arc playing between the rod and the inner edge spins round rapidly in a magnetic field with its lines of force parallel to the rod. If an alternate current with 100

reversals per second is used, it often happens that the arc spins round 50 successive times in the same direction between every two reversals. The spiral paths of the carbon particles show that it is a case of magnetic wind, and not an influence upon an ether phenomenon.

In a large highly exhausted "electric egg" the author recently noticed a curious phenomenon in this connection. It was an appearance resembling a comet, consisting of negative glow light and a brush or tail, which projected from the cathode in an eccentric direction. On approaching a magnet to it from the outside it began spinning around the axis of the vessel, the rate increasing with the proximity of the magnet, and reversing on reversing the poles. The author seeks an explanation in the eccentric impact of a stream of air upon the cathode. [*Wied. Ann., No. 13, 1897.*]

Smallest Electric Motor.

D. Goodin, a watchmaker of McKinney, Tex., has constructed what is supposed to be the smallest electric motor in the world. The motor weighs but 9.160 of an ounce and does not cover a silver dime. Mr. Goodin wears it as a scarf pin. The front of the motor is of gold, highly polished, and the commutator segments are also of the same metal, so that viewed from a little distance the scarf pin has the appearance of a very valuable and rather curiously designed pin. It is only when standing near to Goodin when he is wearing the scarf pin that its nature can be discovered. The first thing to attract the attention is the buzzing of the machine, which, by means of a current obtained from a small chloride of silver battery carried in the vest pocket, is kept in operation at a high rate of speed, and with a noise like a small nest of hornets. The field magnets of the little motor are made of two thicknesses of No. 22 sheet iron scraped down and polished. These are held together with gold screws and wound with No. 26 silk covered wire. The armature is of the four pole type and is wound with No. 36 wire. The little brushes are of marvelous thinness, having been constructed of copper, hammered down with much patience and care. There is a small gold switch on a black rubber base, made with a pin, to be worn on the lapel of the vest.

Patent Amendments.

The House Committee on Patents has acted favorably on the bill amending the patent law of March 3, 1897, so as to limit the restrictions against patenting an article on which a foreign patent had already been issued, or previously described in a foreign publication. The bill provides that the restriction shall not apply to applications made within sixty days from the passage of the proposed amendment.

By an act of Congress approved March 3, 1897, the law relating to patents was amended so as to provide that no patent shall be granted in this country for an invention previously patented in a foreign country on an application filed more than seven months prior to the filing of the application in this country. By the terms of this act it went into effect on January 1, 1898, and all applications not reaching the Patent Office before that date were debarred from the benefits of the law. It has been found upon investigation that this radical change in the law that existed for almost a century has worked much wrong and hardship to American inventors generally, and in many cases has injured citizens of other countries who extend to us reciprocal favors of like character.

The effect of the enactment of this bill will be to extend the manifest intention of Congress to afford to a peculiarly situated class of inventors an opportunity to come in within a certain time, and, as heretofore, avail themselves of a long existing law, and thus incidentally also to legalize those applications for patents which, by reason of unavoidable accident, mistake, ignorance, lack of opportunity or

the like, have been delayed in the filing until after the 1st of January, 1898, and which by reason of the circumstance that their subject-matter had been previously patented abroad for more than seven months are, by the radical changes wrought in the uniformly existing previous law by the act of March 3, 1897, now either void or destined to become burdensome upon the Patent Office and to those concerned.

In view of the importance as well as fairness of the proposed measure, and the many reasons that can be urged in favor of its speedy enactment, there is every reason to believe that it will soon be on the statute books.

A SPECIAL PRIZE OFFER.

Theses Competition for Students.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to *ELECTRICITY*.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For Electricity's Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of *ELECTRICITY*, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and wherever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of *ELECTRICITY* duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all theses submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of *ELECTRICITY*, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we should like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not thoroughly clear, we will be pleased to answer any inquiries relating to this matter.

PARTIAL LIST OF EXHIBITORS AT THE ELECTRICAL AND KINDRED INDUSTRIES EXHIBITION,

Madison Square Garden, New York, May 2—31, 1898.

We take pleasure in publishing a partial list of exhibitors in the Electrical and Kindred Industries Exhibition which is to take place at Madison Square Garden, New York, between May 2 and May 31 of the present year. The large number of well-known firms who have taken space practically assures the success of the Exhibition, and simply goes to show the interest this most laudable enterprise is creating. The list is as follows:

Armstrong Interior Conduit Co., Pittsburg.
American Rheostat Co., Milwaukee.
American Electric Cold Supply Co., Brooklyn.
American Pulley Co., Philadelphia.
American Watchman's Time Detector, 284 Broadway, N. Y.
American Engine Co., Bound Brook, N. J.
Adams-Bagnall Electric Co., Cleveland.
Armington & Sims Co., Providence, R. I.
American Electrician Co., New York.
American Elec. & Maintenance Co., 451 Greenwich st., N. Y.
American Electrical Works, Providence, R. I.
Bossert Electric Construction Co., Utica, N. Y.
Baylis Co., The, 99 Cedar street, New York.
Bernard, E. G., Troy, N. Y.
Borne, Strymer Co., 80 South street, New York.
Belknap Motor Co., Portland, Me.
Brewster Engineering Co., 27 Thames street, New York.
Crocker-Wheeler Electric Co., 89 Cortlandt st., New York.
C. & C. Electric Co., 143 Liberty street, New York.
Corey, B. B., 26 Cortlandt street, New York.
Coho & Co., H. B., 220 Broadway, New York.
Christensen Air Brake Co., Milwaukee.
Card Electric Co., Mansfield, O.
Cleveland Twist Drill Co., Cleveland.
Crouse-Tremaine Carbon Co., Fostoria, O.
Connecticut Telephone & Electric Co., Meriden, Conn.
Crown Woven Wire Brush Co., Salem, Mass.
Cook's Sons, Adam, 813 West street, New York.
Campbell Underground Trolley Co., Towanda, Pa.
Camp Co., H. B., Aultman, O.
De La Vergne Refrigerator Co., E. 133th street, New York.
Diamond Electric Co., Peoria, Ill.
Diesel Motor Co. of America, 11 Broadway, New York.
Edison, Thomas A., Orange, N. J.
Edison Electric Illuminating Co., New York.
Eddy Electric Manufacturing Co., Windsor, Conn.
Electric Storage Battery Co., Philadelphia.
Excelator Electric Co., Brooklyn.
Edison Manufacturing Co., Orange, N. J.
Edison, Jr., Thomas A., 98 Broadway, New York.
Electrical Engineer, New York.
Electrical Review, New York.
Electrical Age, New York.
ELECTRICITY Newspaper Co., New York.
Fisher Foundry & Machine Co., Pittsburg.
Fort Wayne Electric Corporation, Fort Wayne, Ind.
Fuel Economizer Co., Matteawan, N. Y.
Fostoria Incandescent Lamp Co., Fostoria, O.
Fiberite Co., Mechanicsville, N. Y.
Fairchild & Sumner, 39 Cortlandt street, New York.
Gold Car Heating Co., Cliff and Frankfort sts., New York.
Harrison Safety Boiler Works, Germantown Junction, Pa.
Highland Chemical Co., Connelleville, Pa.
Haines Co., William S., Philadelphia, Pa.
Haring Steam Plant Equip. Co., 26 Cortlandt st., New York.
Ideal Electric Corporation, 13th and Hudson sts., N. Y.
Imperial Porcelain Works, Trenton, N. J.
India Rubber & Gutta Percha Insulating Co., Glenwood, N. Y.
Jones & Son, J., 69 Cortlandt street, New York.
Johnston Co., W. J., New York.
Keuffel & Esser Co., 127 Fulton street, New York.
Kelley & Sons, B. F., 91 Liberty street, New York.
Keystone Electrical Instrument Co., Philadelphia.
Lawrence Machine Co., Lawrence, Mass.
Lewis Tool Co., 44 Barclay street, New York.
Lynn Incandescent Lamp Co., Lynn, Mass.
Morris, Elmer P., 15 Cortlandt street, New York.
Machado & Boller, 208 Broadway, New York.
Mowrey & Co., P. M., 318 Broadway, New York.
Niles Tool Works Co., Hamilton, O., & New York.
National Motor Co., 118 Chambers street, New York.
Nowotny Electric Co., Cincinnati.
National Carbon Co., Cleveland.
Nash Gas Engine Co., 99 Cedar street, New York.
New Britain Machinery Co., New Britain, Conn.
N. Y. Safety Steam Power Co., 30 Cortlandt st., New York.
Oswego Boiler Works, Oswego, New York.
Otis Electric Co., 36 Park Row, New York.
Onondaga Dynamo Co., Syracuse, New York.
Paragon Arc Lamp Co., Boston.
Peru Electric Mfg. Co., Peru, Ind.
Peckham Motor Truck & Wheel Co., 26 Cortlandt st., N. Y.
Patrick, Carter & Wilkins, Philadelphia.
Paragon Motor Co., 39 Cortlandt st., New York.

Porter & Remsen, 39 Cortlandt st., New York.
Roebbing's Sons Co., Jno. A., Trenton, N. J.
Safety Insulated Wire & Cable Co., 229 West 28th st., N. Y.
Stephenson Co., Ltd., John, 47 East 27th street, New York.
Sillex Insulation Co., 39 Cortlandt street, New York.
Sprague Electric Co., 20 Broad street, New York.
Simonds Mfg. Co., Pittsburgh.
Sinclair, D. J., Caledonia, New York.
Street Railway Journal Co., New York.
Translucent Fabric Co., Quincy, Mass.
Thomas & Sons, Co. R., East Liverpool, O.
United States Electrical Supply Co., 141 East 25th st., N. Y.
Vacuum Oil Co., Rochester, New York.
Van Horne, Burger & Co., Dayton, O.
Worthington, Henry R., New York.
Walker Co., Cleveland.
Weston Electrical Instrument Co., Newark, N. J.
Warren Electric Mfg. Co., Sandusky, O.
Williams & Co., J. H., Brooklyn.
Wendell & McDuffie, 26 Cortlandt street, New York.
White, J. G., & Co., 29 Broadway, New York.
Western Electrician, Chicago and New York.
Worthington Water Tube Boiler, 30 Cortlandt street, N. Y.
Zimdars & Hunt, 127 5th avenue New York.

The New York Electrical Society.

The New York Electrical Society was organized in 1881 "for the advancement of electrical knowledge and the study of electrical and other scientific phenomena."

In carrying out this purpose, the endeavor of the officers of the Society has been to make it a help and a stimulus to young electricians and an up-to-date means, for the general public, of discussing and illustrating the most recent and interesting developments in electrical work.

Any person of good repute, who is connected with or interested in electrical work, is eligible for admission to the Society. An application blank, which will be forwarded by the secretary on request, must be filled in with the name, address and occupation of the applicant, and returned. The name will be endorsed by a member and duly presented for election. The entrance fee and yearly dues during 1898 (Exhibition Year) are \$3.

It is well known that from the inception of this body to its one hundredth meeting in 1887 a standard of papers and discussion was set which established the reputation of the Society as exerting a most beneficial influence in the dissemination of current electrical knowledge and progress.

The following is the Society's programme of papers to be read, etc., during the remainder of the current season:

"Evolutions in Electric Traction," by Prof. Sidney H. Short.

Paper on subject not yet announced, by Prof. Elihu Thomson.

A visit to the new Union Station of the Brooklyn Edison Company at Bay Ridge, L. I.

"Electrical Tools," by Dr. Schnyler S. Wheeler.

"The Theory, Practice and Future of the Electric Incandescent Lamp," by Thomas A. Edison, Jr.
A Visit to an Underground Trolley Station.

Personal.

Mr. E. D. Matthews of the Trenton Falls Power Company of Utica, N. Y., recently spent a few days in this city on business connected with the company.

Drawbacks—The Kind to Get.

A certain class of our citizens complain of the hardship of our manufacturers not being able to compete successfully for foreign trade on account of the duties imposed on materials used in the manufacture of goods for export. Such talk is due to ignorance of important provisions of the tariff. The whole policy of the Government has been, and is, to foster our domestic manufactures, and with this object in view the Dingley bill very wisely provided that the manufacturers shall be allowed and paid a rebate or drawback of 99 per cent. of the amount of duties paid on materials used in the manufacture of export goods, whether the export article is manufactured wholly or in part from imported materials.

If this provision of the present tariff were more widely understood and the manufacturers knew how

to go to work to obtain the drawback, we believe that our exports would largely increase in the near future. The obtaining of the drawback would in many cases mean that our manufacturers could name a price on their goods which would result in their greatly increasing their export business or opening up one. The manufacturers do not have to export direct, but are entitled to drawback when shipments are made through commission houses. We can refer our manufacturers to a firm of customs brokers, F. E. Wallace & Co., 203 Broadway, New York, who are making a specialty of collecting drawbacks from the Government for the manufacturers.

With free material, which is practically accorded our manufacturers under the provision referred to, we may look confidently for largely increased exports.

LEGAL NOTES.

Judge Lacombe in the United States Circuit Court, New York, has handed down a decision in the suit of the Thomson-Houston Electric Company against the Walker Company of Cleveland and the Union Railway Company on the Van Depoele trolley patent, and ordering an injunction against the Walker Company and the other defendants. The order, however, directs that the injunction, when issued, shall be stayed for 30 days, to give defendants an opportunity to review the decision at this term of the Court of Appeals.

Judge Grosscup, at Chicago, has denied Charles Austin Bates' bill for injunction against the General Electric Railway Company. The bill was filed last October and the finding was given last week. Bates alleged that he was the owner of a large amount of stock in the General Electric Railway Company and that he was being swindled out of it. He prayed an injunction restraining the company from disposing of any more stock and then he asked the appointment of a receiver.

The City Electric Railway Company of Port Huron, Mich., has commenced suit in the Circuit Court against the Guarantors' Liability Indemnity Company of Pennsylvania to recover \$2,000. The company sets forth in its petition that its officers entered into a contract with the Pennsylvania Company whereby that concern guaranteed to pay all damages arising from accidents to passengers. For this protection the railway company paid \$1,500 a year. On December 5, 1896, Conrad Luz, a passenger, was injured. He brought suit against the railway company and secured a verdict of \$1,000. Costs and attorney fees brought the amount up to \$2,000. The railway company paid the amount and presented a bill to the indemnity company. The company for some reason refused to pay, and the above suit was brought.

The Court of Appeals at Albany has affirmed with costs the judgment of the lower court in the case of Robert H. Sherwood and Ralph C. Swan against Maitland E. Graves, appellant. Plaintiff sued for a special compensation of \$2,500, which it is alleged was agreed to be paid to him by Graves under a special contract for the acquisition of all the bonds, stocks, judgments and other liabilities of the Staten Island Belt Railroad Company for the sum of \$65,500 and for the further sum of \$550 for obtaining for defendant the privilege of paying the purchase price of said indebtedness in part in bonds of an Oswego electric company. Swan, who acted as the agent of Sherwood in this transaction, by an order of the Supreme Court was made a party plaintiff to the action. In the lower court plaintiff recovered judgment in the sum of \$3,006, and defendant's motion for a new trial was denied.

In the case of Frank Campbell, a lamp trimmer in the employ of the Binghamton (N. Y.) General Electric Company, whose hand was injured by becoming entangled in the wires of a lamp he was trimming through the alleged carelessness of the driver of an express wagon who drove his team against the lowered wire, breaking it, although the trimmer had given what he claimed was sufficient warning, and

which was accepted as such by two other teams preceding the express wagon, for they drove to one side to avoid the wire, the jury gave the plaintiff a verdict for \$7,000, which, with the plaintiff's consent, was subsequently reduced to \$4,000. The express company against whom the suit was brought appealed the case and the Third Appellate Division has directed a reversal of the verdict, holding that no negligence was shown on the part of the driver of the express wagon, and that plaintiff was shown to have been guilty of contributory negligence. "We are unable to believe," Justice Putnam said, "that negligence could be properly attributed to the driver of the express wagon, lawfully traveling on the public highway, for failing to observe the leg wire which the plaintiff had placed across it. One using a public street has no reason to apprehend danger, and is not required to be vigilant to discover dangerous and unusual obstructions."

Thomas Hill and a number of other holders of the Hudson Telephone Company's stock have asked the courts to institute an investigation of the affairs of the company and to appoint a receiver for it. The president, Charles B. Thurston, and Manager G. H. Atkinson have both tendered their resignations. The company was organized in Jersey City in 1895 with a capital stock of \$300,000. It was formed in the interests of the Best Telephone Company, which is now in process of liquidation. According to the bill of complaint, the Hudson Telephone Company was to pay certain royalties for the use of the transmitter and receiver patents held by the Best Telephone Company, which royalties it is alleged are excessive. The bill further alleges that the Hudson Telephone Company is interested in the New Jersey Telegraph & Telephone Construction Company, and that the promoters of the former practically contracted with themselves in awarding the contract for constructing the lines, which contract, it is alleged, was never advertised according to law. It is alleged that several heavy judgments are pending against the company and that it is practically insolvent.

GENERAL NEWS.

What is Going On in the Electrical World.

Albany, N. Y.—The State Railroad Commission on the 9th inst. considered the application of the Van Brunt Street & Erie Basin Railway Company of Brooklyn to change its motive power from horse to electricity. There was no opposition. The commission reserved its decision.

Annapolis, Md.—A bill has been introduced in the Legislature to authorize the Baltimore & Washington Transit Company of Maryland to construct and operate its railway from the District of Columbia line to the Pennsylvania line, through Prince George's, Montgomery, Carroll and Frederick Counties, Md. The line has already been constructed for some distance, and is designed to pass through Sandy Spring.

Atlanta, Ga.—The electric light committee of council have adopted a resolution recommending the appointment of an electrical engineer to figure on the cost and maintenance of an up-to-date municipal electric light plant, also recommending the appropriation of \$1,000 to defray the cost of the investigation.

Augusta, Me.—The Kennebec Light & Heat Company has determined on building a new power house, made necessary by a large increase in business. The new power station, plans for which are being prepared by Portland parties, will have all the modern machinery and be up to date in every respect.

Baltimore, Md.—A deal has been concluded by which the Central Railway will pass into the control of the Baltimore City Passenger Railway Company and be operated as a part of that company's system. The City Passenger Railway Company agrees to pay \$100 a share to the holders of the \$300,000 worth of stock of the Central, and will also assume the entire bonded indebtedness of that road, amounting to something like \$1,100,000.—F. B. Brownell, the car manufacturer of St. Louis, signed a contract last week to furnish the Baltimore Consolidated Railway Company with sixty new cars.

Bridgeport, Conn.—Judge Elmer of the Superior Court has granted the Bridgeport Traction Company permission to extend its line to Westport. This is a big victory for the trolley company over the New York, New Haven & Hartford Railroad Company. It gives the Traction Company the connecting link of four miles between roads from Bridgeport to Stamford.

Brooklyn, N. Y.—President Baldwin of the Long Island Railroad has approved plans submitted to him for a trolley road which will connect the tracks of the Long Island Railroad with Rockaway Beach. By the proposed arrangement trains will be run from Long Island City and Brooklyn to Hammill's Station, where passengers will be transferred to trolley cars.—The Edison Illuminating Company of Brooklyn has just

closed a contract with the Henry R. Worthington Company for electric power for the pump works at Van Brunt and Rapelyea streets, the great pump company having decided to substitute electricity for steam in the operation of its machinery.—Four additional lines of trolleys began running over the Brooklyn Bridge on Sunday last. This makes six different lines of trolley cars now using the Bridge rails.

Bucyrus, O.—The directors of the Turner Engineering Company have decided to add to their works a complete department for the manufacture of all kinds of electrical appliances.

Burlington, Vt.—The Vermont Electric Company expects to have its power house on the Winooski river fully equipped within a few weeks. Two 225-k. w. Westinghouse three-phase generators are to be installed as soon as they are received from the works, and the other machinery will be put in place as rapidly as possible. The water power which is to be used in operating the generating plant lies between Essex Junction and Burlington. Between these points the river had cut an immense gorge through the rocks, averaging 100 feet in depth. At the head of the gorge, about two miles from Burlington, the stream divides, leaving a high rocky island in the center. Here the Vermont Electric Company has erected its power house.

Chicago.—W. T. Baker, former president of the Board of Trade, owns a water fall near Tacoma, Washington, that he intends to harness and make it furnish electric power to light the cities of Tacoma and Seattle and run all the mills and factories in the two places. It is expected that an average of 30,000 horse power can be secured. The property owned by Mr. Baker includes the famous Snoqualmie Falls, thirty-six miles from Tacoma and twenty-three miles from Seattle.

Chester, Pa.—A deal has been consummated by which the Chester Traction Company's trolley lines have passed into the hands of Philadelphia capitalists. The persons into whose hands the management has passed are represented by E. W. Clark & Co., the brokers, of Philadelphia. The purchasers have also acquired the Wilmington trolley roads, and the two will be united so that a complete system will be established between Chester and Wilmington.—At a meeting of the Chester Traction Company held on the 8th inst., George B. Lindsay and the board of directors resigned, and C. M. Clark was elected president, and C. Ford Stevens, George B. Lindsay, J. E. Moore, H. C. Howard and C. M. Clark elected directors. C. Ford Stevens was elected secretary and treasurer. A meeting of the Union Railway Company was also held, when President Lindsay and the board of directors resigned, and J. E. Moore was elected president and a new board of directors elected.

Chesterfield, Mass.—The long talked of extension of the electric road from Williamsburg to this town is, under the guidance of John C. Hammond, beginning to assume an appearance of reality. At the outset some entertained the idea that the road might go through Goshen, but as the idea is ultimately to form connection with Pittsfield, and as a road through Chesterfield is more direct, the layout will undoubtedly be here. Farms along the proposed route are being purchased by city residents with the view of converting them into summer homes. The road will probably be constructed early in the spring and promises to be a very popular and successful line.

Cincinnati, O.—A \$10,000 bond has been filed with Solicitor A. N. Kinney, of Mt. Healthy, by the Cincinnati & Hamilton Electric Railway Company, obligating the company to construct and operate an electric railway from Hamilton to College Hill within the next 14 months.

Columbus, O.—The new stockholders of the Columbus Electric Light & Power Company have elected the following directors: Mr. George W. Bright, Mr. A. P. Lathrop, Mr. W. F. Kelley, Mr. Fred Hubbard and Mr. O. A. Miller. There will be nine members in the full directory; the remaining four will be chosen at a meeting to be held for the purpose.

Easton, Pa.—Hon. James Kerr, of Clearfield, president of the new Northampton Electric Railway Company, says he intends to start men out immediately to secure right of way for the proposed electric road connecting Easton and Bethlehem. It is the aim of the company to begin the work of construction early in April.

Elroy, Wis.—The question of electric lights for the city is again being agitated. Responsible parties have been conferring with E. S. Willey, who holds a franchise for putting in a plant which expires April 5, with the expectation of eventually making arrangements with him.

Fall River, Mass.—E. P. Shaw, Jr., of Boston, general manager of the Island Tramway to be built between Newport and Fall River, Mass., expects to have the road in running order June 1. The foundation for the power house in Portsmouth has been started.

Fenton, Mich.—A committee of the common council is investigating the subject of municipal ownership of electric lights with the idea of the village acquiring control of the plant which now supplies light for the streets.

Fort Scott, Kan.—The city council has taken formal steps to call a special election to vote \$150,000 for the establishment of water-works and an electric light plant.

Fort Wayne, Ind.—The Fort Wayne Electric Corporation turned out fifty-four incandescent dynamos dur-

ing the month of January. This is the best record ever made by the works for one month.

Frankfort, N. Y.—Beckwith & Quackenbush have been granted a franchise for an electric railway to run through this village.

Laconia, N. H.—The Laconia car shops started up on the 7th inst. on several large orders, one of which is for fifty electric cars for the Boston Elevated Railroad Company, to be delivered by May 1.

Lebanon, Ill.—The Wabash & Mississippi Construction Company, lately organized to build an electric railroad from Vincennes, Ind., to St. Louis, Mo., on the line of the old State road, is rapidly pushing the work of securing the right of way. The Leffler electro-magnetic system is contemplated. This uses neither overhead wires nor the third rail. Work on the road will be started in the spring, and it is claimed that sufficient capital has been secured to insure its completion. Passengers, traffic and light freight will be carried.

Lima, O.—The town trustees have accepted the offer of the company which proposed to supply this town with electric lights, and enough citizens have already subscribed to make the scheme a certainty.

Louisville, Ky.—An electric railway to St. Matthews is one of the future's strong probabilities. It is understood that a charter has been asked for and when granted work will begin at once.

Montreal, Can.—The transforming house of the Citizens' Power & Light Company at Cote St. Paul has been destroyed by fire. Loss, \$100,000.

Mount Pleasant, Pa.—A project to connect Greensburg and Mount Pleasant by an electric street railway line is being backed by Allegheny capitalists. The new line will pass through Spottsdale and terminate at Broadford.

New York.—The Edison Electric Illuminating Company has purchased an entire block fronting on the East River, between Thirty-eighth and Thirty-ninth streets, on which the company will erect an electric light and power plant of imposing dimensions. The price paid for the site was \$345,000.

Norwalk, Conn.—The Westport & Saugatuck Street Railway Company's stockholders are disposing of their stock at \$10 per share to New York and New Jersey capitalists who intend to extend the road to Danbury via Norwalk and make other changes deemed necessary.

Ocean City, N. J.—The ordinance granting a franchise to the People's Electric Light Company has been adopted by the council over the mayor's veto.

Parkersburg, W. Va.—The new Electric Light & Street Railway Company has purchased the Park City Street Railway for \$20,000. All of the old bonds have been taken up and paid for. The new company has surveyed and mapped out all its lines and will begin work on the electric system throughout the city and suburbs immediately.

Peoria, Ill.—The Peoria & Pekin Traction Company has been granted a franchise in South Peoria.

Penn Yan, N. Y.—A change in the route of the electric railroad which it is thought will be constructed between Penn Yan and Lyons is considered advisable. It is now proposed to run the road to Geneva by the way of Benton Center and Hall's Corners. The promoters of the scheme are Baltimore capitalists who are interested in the construction of trolley roads. A stock company will be formed, with a capital stock of \$400,000, if the building of the road is finally decided upon.

Redlands, Cal.—The scheme for the generation of electric power in Mill Creek canyon is being carried out and considerable work has already been done. The plant, which will cost \$250,000, is expected to be in operation by the middle of July. The company will furnish electricity for lighting and power in Redlands, Perris, San Jacinto, Elsinore, Lake View, Wildomar, Colony Heights and Box Springs and to mines and ranches in the vicinity.

Richmond, Va.—The Senate Committee on Roads has reported favorably the bill to incorporate the Peninsula Railway Company. This is one of the companies that propose to build an electric line from Newport News to Old Point. There is at present a line in operation between those places.

San Diego, Cal.—The sale of the Citizens' Traction Company has been postponed until the 21st inst.

Santa Cruz, Cal.—Surveyors have commenced to survey reservoir sites in the vicinity of Big Creek, and will survey a line over the mountains to San Jose to furnish power for electrical purposes.

Schenectady, N. Y.—It is announced that the Metropolitan Traction Company of New York has placed with the General Electric Company an order for \$300,000 worth of machinery for its new power station.

St. Paul, Minn.—The Sanborn street railway ordinance, authorizing the St. Paul City Railway Company to change its Selby avenue cable line into an electric trolley line has passed the board of aldermen. The railway company has decided to use the compound counterweight safety device as an auxiliary to the trolley on Selby avenue hill and has accepted the plans of Milton H. Brondson, chief engineer of the Union Railway Company of Providence, R. I., who designed the counterweight safety device which has been in successful operation on the Union Railway at Providence since it was changed to the trolley system.

Vicksburg, Miss.—The board of mayor and aldermen has granted a franchise to Percival Steel and others, of Chicago, for the construction of an electric street car service in this city. The terms of the franchise require of Mr. Steel and associates to deposit \$500 as forfeit and to file a bond of \$5,000 for the construction and equipment of four miles of road by December 1, 1898, and two miles additional in one year after, the work of construction to be commenced within five months from date of contract.

Washington, D. C.—The Columbia Railway Company intends to change its motive power from the cable to an underground electric system and extend its lines.

Windsor Locks, Conn.—The charter of the Suffield & Windsor Tramway has been purchased by Jesse W. Starr of Springfield, who in the last General Assembly secured a charter for the Springfield & Southwestern Railroad Company, giving him the right to build a trolley line from Springfield to Windsor Locks. The charter just acquired gives the added right to build a line through to Poquonock, where connection is to be had with Hartford.

Worcester, Mass.—A plan to have an electric street car line extending from Worcester to Milford, thence to Franklin, and thence to Woonsocket, by way of Wrentham, has assumed definite form. A petition was presented to the session of the Massachusetts Legislature two weeks ago, asking for a special charter for the Worcester, Milford, Attleboro & Woonsocket Street Railway Company, among the signers being George W. Wiggins, Joseph G. Ray, Edgar K. Ray and Orestes T. Doe of Franklin, Edward H. Rathbun of Woonsocket and Franklin W. S. Read of Leominster, C. W. Shippe of Milford, W. H. Tyler of Worcester, and others. The bill, as presented, petitions for the chartering of the enterprise, the bond issue to be \$350,000, with a stock issue of the same amount. The promoters of the scheme are all men of large means, backed by unlimited capital, and say that if their petition for a charter is granted all the capital necessary will be subscribed immediately afterward and the new line completed early next summer.

PERSONAL AND MISCELLANEA.

Robert H. Lerch of Easton, Pa., has been chosen general manager of the General Electric Company of Freeport, Ill., to succeed J. T. Schlacks, resigned.

The St. Louis "Star" says: "The latest appliances for propelling electric cars without overhead wires will be manufactured by the Mississippi Valley Electrical Company, which recently filed articles of incorporation. It is claimed that the inventions to be put on the market by this company will revolutionize street railway methods, and that they can be applied to any trolley line without the necessity for any alterations."

Thomas H. McLean, formerly connected with the electric street car systems of Brooklyn, N. Y., has been appointed general manager of the Toledo Traction Company's street-car system and electric light and power business at Toledo, to succeed S. S. Jewell, resigned.

Robert Fox, who had been general superintendent of the Scranton Railway Company, has accepted the position of general manager of the electric railway lines at Wilmington, Del., and Chester, Pa. Before leaving Scranton Mr. Fox was presented with a fine silver tea service by the employees of the Scranton Railway Company.

J. R. Crabb of Denver, Col., has invented a switch for electric street cars that does away with the rod the motorman is compelled to carry. It will throw a switch fifteen feet ahead of the car. By pressing down on a short lever the car will turn to the right, by raising upon the bar the car will go to the left or straight ahead as the case may be. It will work while the car is running fast as well as slow. Any switch that is now in use can be used.

John Edmund Ridall of Pittsburg, Pa., a popular business man and prominent in electrical matters, died at his home in that city on the 8th inst., almost at the moment that he was elected a director of the Allegheny County Light Company, which was holding its annual meeting at the time. Mr. Ridall had been since 1880 the manager and representative in Western Pennsylvania of the Brush Electric Company of Cleveland and introduced the arc light in Allegheny County. The Pittsburg "Dispatch" states that "a suit which Mr. Ridall instituted against the Brush Electric Company, involving about \$40,000, which he claimed as commission on sales, is still pending. It grew out of the merging of another electrical concern, with which Mr. Ridall had an iron-clad contract, into the Brush Company. In accordance with the terms of this contract Mr. Ridall laid claim to commission on all sales made in his district. One item which is specifically named is for commission on a \$300,000 arc light contract, made, it is said, with the city of Pittsburg." Mr. Ridall was twice married and twice widowed, his second wife dying in 1887. Five children survive—O. Hanson Ridall, John E. Ridall, Jr., Jacob Cook Ridall, Samuel Holland Ridall and Elizabeth Eakin Ridall.

Joseph A. McElroy of New York has gone to England partly to supervise the building of an electric road in Glasgow and partly on the invitation of an English syndicate to explain the merits of the McElroy-Grunow third-rail electric system, which has been patented in this country and also in Europe. Mr. McElroy is a Bridgeport, Conn., boy, and the "Standard" of that town has a very favorable opinion of the invention to which he has given his name in connection with that of

William Grunow of West Point, who has a residence in Bridgeport. The "Standard" says: "Both Mr. McElroy and Mr. Grunow are enthusiastic over their new device in the third-rail line, and they say that it goes far ahead of any system which has yet been invented. That this claim is a just one has been recognized by the English syndicate, and it has been taken up by the Englishmen and will be pushed with energy. The offers from English capitalists were so much better than those of the Americans it did not take long for the inventors to decide that they could do far better by sending the invention to England and planting it firmly in that country. That they will have the greatest success there is very little doubt felt, as many of the best European engineers have examined the system and have pronounced it to be far better than any yet brought to the front."

RECENT COMPANY ELECTIONS.

Alpena Electric Light Company, Alpena, Mich.—President, W. H. Johnson; vice-president, Henry Bolten; secretary, W. E. Hazell; treasurer, Donald McRae; directors: Henry Bolten, Donald McRae, W. H. Johnson, W. E. Hazell, H. H. Wittelschofer, J. H. Kerr, J. D. Turnbull.

Badger Illuminating Company, Milwaukee, Wis.—President, Henry C. Payne; vice-president, John I. Beggs; secretary and treasurer, C. A. Spofford; assistant secretary, F. H. Whitney; directors: H. C. Payne, C. A. Spofford, J. I. Beggs, F. G. Bigelow, Charles F. Pfister.

Bay Shore Electric Lighting Company, Bay Shore, N. Y.—President, Josiah Robbins; vice-president, Selah T. Clock; secretary, Freeman T. Hulse; treasurer, John R. Howell; directors: Josiah Robbins, Selah T. Clock, E. S. Bailey of Islip; U. P. Strong, Edward B. Mowbray, Freeman T. Hulse and John R. Howell.

Delta Electric Power Company, Delta, Pa.—President, C. F. Smith; vice-president, S. J. Barnett; secretary, C. O. McConkey; treasurer, W. Z. Macomber; superintendent, S. J. Whiteford; directors: V. G. Stubbs, S. J. Whiteford, C. F. Smith, C. O. McConkey, W. Z. Macomber, H. Clay Whiteford, S. J. Barnett.

Depere Electric Light & Power Company, Green Bay, Wis.—President, J. P. Dousman; vice-president, R. J. McGeehan; treasurer, William Workman; secretary, William Armstrong; manager, C. G. Wilcox; directors for three years: C. G. Wilcox and L. Minich.

Delaware Valley, Hudson & Lehigh Railroad Company, Stroudsburg, Pa.—President, Dr. J. B. Lung; treasurer, M. F. Coolbaugh; secretary, J. H. Shull; directors: J. B. Lung, C. A. Woolsey, Frank Pettit, J. Kellow, all of Brooklyn; J. H. Vanetten, of Milford; M. F. Coolbaugh, F. W. Ellenberger, E. F. Peters, W. S. Shafer and J. H. Shull of Monroe county, Pa.

Edison Electric Light Company, Mt. Carmel, Pa.—President, M. K. Watkins; vice-president, H. T. John; treasurer, S. E. Bergstresser; secretary, Reuben Kline.

Greensburg & Hempfield Electric Street Railway Company, Greensburg, Pa.—President, Thomas Donohoe, Sr.; directors: the president and F. Y. Clopper, John B. Head, W. F. Sadler, Sr., H. Beeten.

Hamilton Street Railway Company, Hamilton, Can.—President, William Gibson; vice-president, Edward Martin; directors: Wm. Gibson, M. P., Edward Martin, B. E. Charlton, John A. Bruce, F. W. Fearman, Wm. J. Harris, and Isaiah Beer.

Lackawanna Valley Traction Company, Scranton, Pa.—President, L. A. Watres; secretary and treasurer, Robert C. Adams; directors: L. A. Watres, Robert C. Adams, Mrs. E. M. Amerman, P. S. Page and R. A. Gregory.

Louisville Electric Light Company, Louisville, Ky.—Directors: A. H. Barret, Harry Bishop, J. B. Speed, G. W. Morris, J. M. Atherton, John Marshall, James A. Leech, Joseph Scheffler, M. R. Wheat.

Marietta Electric Company, Marietta, Ohio—President, A. L. Gracey, vice-president, Nelson Moore; general manager and treasurer, W. H. H. Jett; secretary, J. S. H. Turner; auditor, John Kaiser; directors: the officers and J. S. Simpson, H. W. Craig, I. O. Alcorn, Geo. B. Eysse.

Metropolitan Electric Light Company, Reading, Pa.—President, John A. Rigg; secretary and treasurer, K. A. Fichtelhorn; directors: R. N. Carson, William R. McIlvaine, R. L. Jones, H. C. England, Jas. A. O'Reilly, George H. Valentine, L. T. Custer, R. N. Buckley, John A. Rigg.

Milwaukee & Waukesha Electric Railway Company, Milwaukee, Wis.—Directors: John A. Kinney of New York, E. H. Bottom, C. E. Wild, C. L. Gross, Frank Koehler and S. I. Henderson.

New York & Staten Island Electric Company, Staten Island, N. Y.—Directors: H. H. Rodgers, Samuel Thomas, A. B. Fletcher, Joseph E. Bourne, Col. G. B. M. Harvey, Edward P. Doyle and John P. O'Brien.

Norfolk Street Railway Company, Norfolk, Va.—President, R. Lancaster Williams of Richmond; vice-president, Frank O. Briggs of Trenton, N. J.; treasurer, Walter H. Doyle of Norfolk; secretary and assistant treasurer, H. C. Whitehead of Norfolk; manager, W. M. Roseborough; directors: R. Lancaster Williams, Richmond; Frank O. Briggs, Trenton; J. W. Middendorf, Charles R. Spence and Robert C. Davidson, Baltimore; R. B. Cook, W. H. Doyle and J. P. Andre Mottu, Norfolk; William M. Habliston, Petersburg and Richmond.

Potomac Electric Power Company, Washington, D. C.—Directors: O. T. Crosby, Charles A. Lieb, F. C. Stevens, H. D. Mirick, W. S. Terry, James B. Lackey and Z. B. Deyber.

Reading Traction Company, Reading, Pa.—President, John A. Rigg; secretary and treasurer, M. A. Aulenbach; directors: John A. Rigg, Richmond L. Jones, Robert N. Carson, B. Nelson Buckley, O. S. Geiger.

Reading & Pottstown Electric Railway Company, Reading, Pa.—President, John A. Rigg; directors: the president and Richmond L. Jones, Samuel E. Rigg, M. C. Aulenbach, K. A. Fichtelhorn.

Reading City Passenger Railway Company, Reading, Pa.—President, B. F. Owen; vice-president, James L. Douglass; secretary and treasurer, H. A. Mühlenberg; directors: C. H. Schaeffer, H. A. Mühlenberg, John Rick, Charles Rick, A. Thalheimer, William R. McIlvaine and Mathan Harbert.

Southern Electric Railway Company, St. Louis.—Directors: Charles F. Orthwein, Henry Nicolaus, C. H. Spencer, Harrison I. Drummond, Joseph S. Minary.

Trenton Passenger Railway Company, Trenton, N. J.—President, Henry C. Moore; vice-president, Thomas S. C. Barr; secretary and treasurer, John L. Kuser; directors: Thomas S. C. Barr, Col. A. R. Kuser, John L. Kuser, Ferdinand W. Roebbling, Jonathan H. Blackwell, E. J. Moore.

United Traction Company, Reading, Pa.—President, John A. Rigg; secretary and treasurer, M. A. Aulenbach; directors: R. N. Carson, Wm. R. McIlvaine, R. L. Jones, H. C. England, James A. O'Reilly, George H. Valentine, L. T. Custer, R. N. Buckley, John A. Rigg.

Help to fight the Electrical Trust by subscribing for ELECTRICITY.

COMMERCIAL PARAGRAPHS.

Thorburn Reid, whose card appears elsewhere in this issue, is designing electrical apparatus for several prominent manufacturing concerns. Mr. Reid makes a specialty of designing and supervising railway, light and power transmission plants, and also of designing alternators, synchronous alternating motors, induction motors, transformers and rotary converters and direct current dynamos and motors, guaranteeing their performance. Mr. Reid solicits correspondence (122 Liberty street, New York).

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

Any one desirous of obtaining electrical measuring instruments would do well to address the Cherry Electric Works, 25 and 27 Third Avenue, New York. This concern has recently placed upon the market an inexpensive but accurate voltmeter reading from 0 to 10 volts and an ammeter reading from 0 to 10 amperes. The price of these instruments is but \$1.50 each, and for experimental purposes, where the standard instruments would prove too expensive, these will be found both valuable and trustworthy. The mechanism is enclosed in a hardwood case, which gives them an extremely neat and handsome appearance. There is no doubt but what these instruments fill a long-felt want, as many amateurs have been kept from experimenting owing to the cost of the standard instruments.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

We would call our readers' attention to Mr. Charles J. Kintner's card which appears in this week's issue. Mr. Kintner, who is now practising as patent expert at 45 Broadway, New York, was for many years connected with the Patent Office in Washington as principal examiner and a electrical expert in charge of the electrical department. The Hon. L. Q. C. Lamar, late Secretary of the Interior, had a high regard for his ability and electrical knowledge concerning inventions, which reputation Mr. Kintner has fully lived up to since being in business for himself. As a patent expert Mr. Kintner stands high, as shown by the many important patents taken out by him in the past few years. When Mr. Kintner fails to obtain a patent on an invention it is safe to assume the invention is not patentable.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

INCORPORATIONS.

The Skagway Light & Water Company, Seattle, Wash. Capital stock, \$250,000.

The Weston Electric Appliance Company, Newark, N. J.—Capital stock, \$750,000, of which \$20,000 has been paid in. Incorporators: Edward Weston of Newark, Franz C. Matthieson of New York, and Henry E. Niese of Jersey City. The company will build plants at Waverly, N. J., a short distance south of Newark.

The Maurice River Water & Electric Power Improvement Company, Vineland, N. J.—to introduce electric power in

Vineland for manufacturing and other purposes. Incorporator: Charles K. Landis, the founder of Vineland.

The National Mill, Water & Light Company, Angola, Ill.—to put in a power plant by which to supply the town of Angola with a flouring mill, waterworks, electric light and a street railroad.

The Robb Conduit & Underground Electric System Company, New York City. Capital stock, \$25,000. Directors: F. D. Robb and Dr. G. E. Crittendon, of Hot Springs, Ark.; Fritz Andraea and Gertrude Hanbury, of New York City; and A. L. Wear, of Cornwall.

The El Dora Townsite Company, Denver, Col.—to own and operate land for a townsite, to own and operate mines and to sell electricity for power, etc.; operations to be carried on principally in Boulder County. Incorporators: R. P. Davy, Thomas G. Roberts and Job T. Lyon.

The Alaska Light & Power Company, Tacoma, Wash. Capital stock, \$25,000. Incorporators: I. W. Anderson and Fred C. Brewer.

The Needle Mountain Electric & Power Company, Denver, Col.—to operate in La Plata County. Capital stock, \$200,000. Incorporators: Lyman B. Jordan, John Lawson and George F. Carris.

The Sterling Electric Company, Chicago, Ill. Capital stock, \$30,000. Incorporators: Edward A. Biggs, John E. Hunt and Walter I. Hall.

The Mississippi Valley Electrical & Manufacturing Company, St. Louis, Mo. Capital stock, \$100,000, fully paid up. Incorporators: John R. Farmer, Daniel H. Lohse, Edward Buder, Anthony F. Ittner and Eugene Buder.

The South Illinois Electric Light Company, St. Elmo, Ill.—to operate an electric light plant. Capital stock, \$20,000. Incorporators: W. L. Stocker, G. W. Harlan and A. J. Johnson.

The Clear Creek Mill Company—to establish a large electric plant for the treatment of ores at Empire, Col. Paid up capital, \$30,000. Incorporators: B. F. Taft, F. R. Kimball, J. H. Ware, D. H. Kirby and others. Poston capital is back of the enterprise.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 8, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

598,580. Trolley-Head. Herbert W. Smith, Somerville, Mass., assignor to the F. L. Gaylord Company, Ansonia, Conn. Filed June 10, 1897.

598,661. Electric Street Car Trolley. Joseph T. Himmege, La Rue, Ohio. Filed Oct. 20, 1896.

598,731. Electric Railway. Martin T. A. Kuberschky, Berlin, Germany, assignor to the General Electric Company of New York. Filed March 26, 1897. Renewed Jan. 10, 1898.

598,538. Fender or Guard for Tramway Cars. John R. Seaton, Cohoes, N. Y. Filed Aug. 10, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

598,697. Electric-Arc Lamp. Sidney I. Crain, Cincinnati, Ohio, assignor of two-thirds to Stewart Shillito and Charles A. Irwin, same place. Filed July 21, 1897.

598,726. Incandescent Electric Lamp and Process of Making Same. John C. Fish, Shelby, Ohio, assignor to the Shelby Electric Company, same place. Filed Aug. 3, 1897.

598,733. Safety Cut Out for Electric Lamps. Alfred N. Lovelace, Knoxville, Tenn. Filed June 12, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

598,517. Testing Apparatus for Electric Circuits. Edward Heymann and Frank W. Heymann, Boston, Mass. Filed Feb. 26, 1897.

598,510. Construction of Dynamo-Electric Machinery. Alfred Soames, London, England, assignor to the Davies Motor Company, Limited, same place. Filed Dec. 6, 1897.

598,553. Electric Switch. Johan M. Andersen, Boston, Mass., assignor of one half to Albert Anderson, same place. Filed Dec. 5, 1896.

598,655. Coin-Controlled Machine for Automatically Distributing Electric Currents. John W. Dawson, Louisville, Ky. Filed Nov. 18, 1896. Renewed Dec. 23, 1897.

598,657. Alternating Current Dynamo. William B. Esson, London, England. Filed April 21, 1896.

598,679. Means for Use in Operating Electrical Switches. Thomas H. Parker, Tettenhall, England. Filed Dec. 9, 1897.

598,715. Automatic Electric Switch. Frank C. Perkins and John D. Killip, Buffalo, N. Y.; said Killip assignor to said Perkins. Filed Sept. 25, 1897.

598,861. Electric Time Switch. George F. Goodwyn, Arnprior, Canada. Filed April 26, 1897.

ELECTRIC HEATERS, ETC.

598,568. Method of Manufacturing Rheostats, Electric Heaters, etc. Harry W. Leonard, New York City. Original application filed April 9, 1897. Divided and this application filed Jan. 8, 1898.

598,638. Electric Heater. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company, same place. Filed March 21, 1894.

598,639. Electric Radiator. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company, same place. Filed Jan. 25, 1895.

598,640. Electric Heater. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company, same place. Original application filed April 6, 1895. Divided and this application filed Aug. 6, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

598,610. Coin-Controlled Telephone Pay-Station. William Gray, Hartford, Conn., assignor to the Gray Automatic Telephone Pay Station Company, same place. Filed Dec. 4, 1895.

598,833. Electric Call-Box System. William T. Budds, Charleston, S. C. Filed Aug. 23, 1897.

MISCELLANEOUS.

598,498. Junction Box for Electric Conductors. Thomas J. Close, Philadelphia, Pa. Filed May 26, 1897.

598,508. Automatic Electric Fire-Alarm. William A. Guthrie, Durham, N. C. Filed July 7, 1897.

598,566. Primary-Battery Cell. Fred H. Brown, Chicago, Ill. Filed Dec. 9, 1895. Renewed Jan. 12, 1898.

The Minnesota Central Telephone Company has sent a communication to the city council of St. Paul, asking for a franchise to supply telephone service in that city. The communication, which was referred to the committee on streets, stated that the Minnesota Central Telephone Company is one of four comprising the Western Electric Telephone system; that it has about three thousand miles of toll lines in operation, particularly in Southern Minnesota and Northern Iowa, extending into South Dakota, with branches in Wisconsin. The stockholders, the communication adds, are business men of the towns reached by the company's lines. Minneapolis, it is stated, granted the company a franchise on January 28, and it stands ready at an early date, as soon as it gets a franchise, to give St. Paul as good service as Minneapolis will get. The lines of the company are in operation at points adjacent to the Twin Cities.

At the Electrical Club's annual banquet at Boston on the evening of the 8th inst., a telephone receiver was placed at the plate of every guest, and a huge megaphone was suspended from the ceiling. Direct wires had been established between the central offices in New York and Chicago and the central office in Boston, and from the latter to the banquet room. By these means the speeches, jokes, applause, etc., of the banqueters were communicated instantaneously to numbers of friends assembled for the purpose in the cities named, and these in turn were enabled to contribute by their happy sallies to the interest of the occasion. When picture telephony is perfected, the enjoyment of all such gatherings will be doubly enhanced by seeing their friends as well as hearing their voices.

Telephone manufacturers in Chicago propose to wage a vigorous warfare against a bill now before the Legislature which provides that after making a statement to the Auditor the person or corporation making the same shall pay a tax of \$10 for each telephone connection and the further sum of \$50 for each telephone connection with a device known as a telephone slot arrangement. As explained by Vice-President W. A. Bisland of the Western Telephone Construction Company, "this seems to be the Bell method of fighting the cheaper rates that are in vogue among the independent companies now giving towns and farming districts in Illinois good service. The measure will not hurt the Bell Company as much as the independent companies for the reason that the older corporation feels itself well entrenched by the occupancy of the field in the larger cities."

Mr. Jenkins has introduced a bill in the House of Representatives providing that "whereas it is represented to this present Congress that the Automatic Telephone Exchange Company (limited) of Washington and London, England, a corporation duly organized and operating under and by virtue of the general laws of the State of West Virginia, is desirous of establishing its system of telephony within the District of Columbia, and that in consideration of its being permitted so to do, it will supply a much superior service to that now in use in the District of Columbia, and at less than one half the rates now being charged," the company be authorized to lay conduits in Washington and proceed to conduct a telephone business.

The Owosso Telephone Company has closed a contract with the New State Telephone Company to furnish equipments for an exchange at Owosso, Mich. There will be 150 'phones to start with, though the switchboard will accommodate twice that number. The copper metallic toll line of the New State Company will be extended from Fenton to Owosso, and the exchange will be in operation by the middle of April.

Judge Toulmin of the United States District Court at Mobile, Ala., has handed down an opinion in the case in equity of the Western Electric Company, Chicago, vs. the Home Telephone Company, Mobile, for infringement. A decree will be entered on two claims of claimants, and an accounting of profits and damage in respect to these claims is ordered. The injunction is not to be operative until 60 days after entry of the decree on account of public inconvenience.

The new telephone company at Indianapolis is busy placing its plans before members of the city council so that the latter may be fully informed of the intentions of the company when application for a franchise is made. There is some talk of reviving the Citizens' Co-operative Telephone Company, which was granted a franchise several years ago but afterwards became involved in lawsuits and retired from the field.

An ordinance has been submitted to the Parkersburg, W. Va., council granting a franchise to the Home Telephone Company. The ordinance provides that the company shall begin the construction of its telephone system within one year from the date of passage of ordinance, and that a rate of not over \$24 per year shall be charged for the use of the 'phones by subscribers. The company is

composed of F. H. Yost, H. S. Yost, P. W. Yost and G. S. Basnett.

The Newark (N. J.) Telephone Company has re-elected these officers: President, John M. Gwinnett; secretary, James F. Connelly; treasurer, Samuel Klotz; directors: John M. Gwinnett, Timothy W. Lord, George W. Wiedenmayer, Charles B. Smith, Samuel Klotz, Bernard Straus, Theodore C. E. Blanchard, James F. Connelly, P. J. Nevins, Henry Vincent Jackson, L. Eugene Hollister.

The manufacturing property of the Best Telephone Company is advertised by the receivers to be sold at auction in Baltimore, Md., on the 17th inst. A catalogue of the articles to be disposed of contains 28 pages and includes the patents and certificates of stock owned by the company as well as the machinery, plant, electrical and telephone apparatus, office furniture, etc.

The borough council of Bellefonte, Pa., has granted a franchise to the Millheim Telephone Company to erect poles and wires and establish an exchange in the town. The Millheim Company was organized a year ago and lately extended its service to Bellefonte and through Union, Snyder and adjoining counties. The Bell Company has now arranged to extend its service all over the territory covered by the Millheim Company.

A dispatch from Macon, Ga., to the Atlanta Journal states that there is some talk of a new telephone company for Macon in opposition to the Bell company, and the report that the ground is being surveyed with that end in view is borne out by the fact that application has been made to the council for information on the subject of the ordinances affecting telephone companies in the city.

The certificate of the consent of two-thirds of the stockholders of the Ossining Home Telephone Company of the village of Sing Sing, N. Y., to mortgage its plant and franchises for \$25,000, the amount being less than two-thirds of the value of the plant and franchises, has been filed in the county clerk's office at White Plains.

At the annual meeting of the Saratoga, Adirondack and Lake George Telegraph Company, held at Saratoga, N. Y., the following officers were elected: President, W. West Durant, New York City; vice-president, H. G. Young, Albany; secretary and treasurer, J. W. Burdick, Albany; general manager, W. C. Humstone, New York City.

A correspondent of the Charleston News and Courier states that the telephone manufacturing company at Sumter, S. C., has recently enlarged its plant and is overrun with work. The correspondent says he saw shipments going to New York, New Orleans, Knoxville, Vicksburg and Durham, N. C.

Steps have been taken at Mankato, Minn., to organize an independent telephone company to be known as the Mankato Citizens' Telephone Exchange Company. Articles of incorporation will be prepared at once.

A company has been organized at Versailles, Ky., to erect a telephone system there. The incorporators are W. R. Procter, Breck B. Smith and Charles R. Powell.

New Companies Incorporated.

The Creswell Telephone Company, Creswell, Md. Capital stock, \$1,200. Directors: Joseph B. Hanway, Harry P. Strasbaugh, Christian Smith, John McKee, Willard G. Rouse, Joseph F. Callahan, George F. Burkley, Joseph Gorrell and Frank W. Kimble.

The Livingston County Telephone Company, Pontiac, Ill. Capital stock, \$65,000. Incorporators: W. E. Herrou, John S. Murphy and A. M. Legg.

The Fulton Telephone Company, Fulton, Oswego County, N. Y. Capital stock, \$15,000. Directors: L. nox Smith and J. P. Whitaker, New York City; George C. Webb, J. C. Curtis, Francis Stiles and F. A. Sage, Fulton.

The Moore Telephone Manufacturing Company has filed articles of incorporation at Trenton, N. J. It has a capital stock of \$50,000, of which \$14,800 is paid in.

The Clifton Forge Mutual Telephone Exchange, Clifton Forge, Va. Capital stock, \$5,000. Incorporators: William Patrick, president; N. O. Watts, treasurer; J. A. Sproul, secretary and general manager.

The Toccoa Telephone Company, Toccoa, Ga.—to construct and operate a telephone system. Capital stock, \$5,000. Incorporators: John McJunkin, C. H. Dance, L. P. Cook and others.

The Coles County Telephone Company, Mattoon, Ill., has certified to an increase in capital stock from \$12,000 to \$35,000.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 10½@10½c.; Lake, 10½@11c.; cast ing, 10½@12c.

The Electric Railway Equipment Company of Washington, D. C., of which A. C. Greenlee is president, has been granted a charter. The capital stock is \$100,000.

The Jones Brothers Electric Company, Cincinnati, has increased its capital stock from \$200,000 to \$220,000.

The Welsbach Commercial Company, Philadelphia, has declared its usual 2 per cent. quarterly dividend, payable March 10.

Owosso & Corunna Electric Company is the name of a new corporation organized at Owosso, Mich. Its capital stock is \$150,000.

Application has been made to the New York Stock Exchange to list Twin City Rapid Transit Company \$577,000 additional cumulative 7 per cent. stock.

The Chicago City Railway Transit Company has been organized at Chicago to build and operate an elevated railway line. The capital stock is \$1,000,000.

The Philadelphia "Times" states that "the local electric light consolidation plan, it is said, will not interfere with the April interest and dividends on Pennsylvania Heat, Light & Power stocks."

L. F. Hyde and Charles S. Baxter of the law firm of Hyde & Baxter, Boston, have taken charge of the claims department of the Boston Elevated Railway Company, vice W. B. Sprout, resigned. Last year the West End Street Railway Company paid out \$470,000 in settlement of claims.

The stockholders of the Citizens' Electric Light & Power Company of St. Louis have voted to issue bonds to the amount of \$2,000,000. This action was taken pursuant to a call issued January 28, at which time the company voted to increase its capital stock from \$750,000 to \$2,000,000.

A distribution of \$3 per share was made on the 12th inst. upon common stock of Street Railway & Illuminating Properties, Boston, to stock of record at the close of business February 8. This is the first dividend on the common stock. Future dividends are expected at irregular intervals.

There will be a meeting of the stockholders of the Metropolitan Street Railway Company in New York on March 4 to authorize the lease of the Second Avenue Railroad. The stockholders of the latter company will also meet that day and authorize the lease of their line to the Metropolitan.

It is announced that the Metropolitan Street Railway, New York, will shortly issue \$10,000,000 of additional stock, increasing its share capital from \$30,000,000 to \$40,000,000. Each stockholder will be permitted to subscribe for one share of new stock for every three shares now held. The stock will be issued at par, thus raising \$10,000,000.

It is reported that a syndicate of New York capitalists are endeavoring to secure control of the Dolgeville Electric Light & Power Company and of the Little Falls Electric Light & Power Company. The Dolgeville company has just completed a large electricity generating plant at the manufacturing village of Dolgeville, N. Y., and is supplying the Little Falls company with current for its service.

The Raleigh, N. C., "Post" of the 8th inst. says: "The Southern Bell Telephone Company have filed with the Railroad Commission their \$5,000 bond. It is given by the United States Fidelity & Guarantee Company. The Commission ordered a reduction of telephone rental rates to go into effect February 1, and afterwards granted the companies another hearing February 17. The Commission then allowed the companies, if they filed this bond to protect the telephone users, not to put the new rates into effect until after the final decision February 17."

The various street railway lines in Dallas, Tex., recently acquired by C. H. Alexander and E. A. Ellis, have been reorganized under a new charter and capitalized at \$1,000,000. The new name is the Dallas Consolidated & Electric Street Railway Company. C. H. Alexander is president and general manager and Emmette A. Ellis is treasurer. Messrs. Ellis and Alexander have filed deeds conveying their interests in the lines to the new company.

The finance committee of the Baltimore City Passenger Railway Company, to whom has been submitted the question of the manner of raising the funds necessary to pay for the stock of the Central Railway Company, will, it is understood, recommend to the directors that \$1,000,000 be raised, of which \$600,000 will be paid for the Central stock and the remaining \$400,000 used to retire the floating debt of the Baltimore City Passenger Railway Company incurred in electrifying certain of the company's lines and providing for future improvements.

The reports of the Brooklyn Heights Railroad Company and the Brooklyn Queens County & Suburban Railroad Company for the quarter ending December 31, 1897, have been sent to the State Railroad Commissioners at Albany. The gross earnings of the Brooklyn Heights Railroad Company were \$1,110,371.18, an increase of \$47,200.62 over a like period in 1896, and operating expenses \$660,277.40, an increase of \$27,479.77. The net earnings were \$450,093.78, against \$430,372.93 for the last quarter of 1896. There was a surplus of \$131,354.09 for the year. The net earnings of the Brooklyn, Queens County & Suburban were \$80,714.68 for the quarter, an increase of \$17,963.05 over a like period in 1896.

Judge Cox has decided in the Fredonia Hotel case at Washington, D. C., that the guests of a hotel have not the right to use the hotel telephone for their private business without paying for it to the company, and that if the telephone is used for hotel business by the guests a clerk of the house must use it, and not the guests. A hotel telephone is not different from a private telephone, it may be used only for the special business of the house and not by outsiders who do not pay.

The United Electric Securities Company of Boston on Monday last purchased \$6,000 of its 5th series 5 per cent. collateral trust bonds, leaving \$469,000 outstanding; lowest price was 96½, highest 102½;—\$17,000 of the 6th series, leaving outstanding \$308,000; lowest price was 99, highest 102½;—\$20,000 of the 8th series, all that were offered, leaving outstanding \$500,000; lowest price was 99½, highest 102½;—\$97,000 of the 9th series, leaving outstanding \$494,000; lowest price was 100, highest 102½.

An outline of the agreement reached between the Brunswick Traction Company of New Brunswick, N. J., and the New York & Philadelphia Company, of Philadelphia, which have been at war for the last few years over franchises, has been made public. Mr. Radel, the president of the Brunswick Company, continues in his position, and is to build lines connecting the different points in Middlesex county and thence to Raritan. The Philadelphia Company is to build in Somerset county, and connect the allied lines with Princeton and Trenton. When the system thus jointly planned is in operation there will be continuous trolley connection from Perth Amboy on the east to Trenton on the west.

Justice Wilmot, in the Supreme Court, Brooklyn, has handed down an opinion contrary to the general understanding of the Kingston decision as affecting the right of a surface railroad to operate on the tracks of another company without first obtaining the consent of a majority of the property owners. The case before the Justice was that of Kunz vs. the Brooklyn Heights Railroad Company. Kunz sought to restrain the company from constructing a curve near his property at Adams and Prospect streets to connect two lines. The Justice, in finding for the railroad company, said that section 78 of the railroad law makes it legal for any company to enter into a contract with another for the use of its lines. In referring to the Kingston decision of the Appellate Court to the opposite effect, the Justice said the opinion of that court "was merely a dictum of the Justice, as he himself clearly intimated."

ELECTRICITY.

Vol. XIV.

NEW YORK, FEBRUARY 23, 1898.

No. 7.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

EDITORIAL NOTES.

Municipal vs. Private Ownership.

We note with regret that two bills were recently introduced in the Assembly at Albany, one providing for municipal ownership of railroads, surface, elevated or underground, by cities of the first-class, while the second provides for municipal ownership of lighting facilities, such as gas, electric light, etc. Although the probabilities are that these two bills will never become laws, it is to be deplored that anyone should have deemed it expedient to introduce two such measures after comparing the statistics of communities having municipal ownership with those in which street railways and lighting plants are owned and operated by private corporations. Considerable has been written on this subject of late, and all the facts and figures so far obtained simply go to show that nearly every street railway or electric lighting plant operated by a municipality is a dismal failure.

Take, for example, Austria. After spending immense sums of money in building and equipping the railways they were ultimately sold for about one-half what they cost to private corporations, owing to the inability of the Government to operate them successfully.

The advocates of municipal ownership have repeatedly pointed to Glasgow as an example of what a city can accomplish in the way of successfully operating street railways. The facts of the case are that the conditions existing there differ so materially from those existing in American cities that comparisons are of little or no value. In Glasgow the street railway fare averages 1.85 cents per mile, the average trip being one mile. In most of the large cities in this country, such for instance as Brooklyn, a passenger may ride in the neighborhood of 18 miles for 5 cents or for a little less than three-tenths of a cent per mile. This is accomplished in spite of the higher wages which prevail on this side of the Atlantic. The drivers and conductors in Glasgow after two years of service are paid at the rate of \$1.04 a day, whereas the motormen and conductors in Brooklyn receive from \$2 to \$2.50 a day, other employees, such as inspectors, starters, car cleaners, etc., being likewise paid proportionally higher. It will therefore be seen that the scale of wages here, as shown in the case of Brooklyn, is about double that of Glasgow. And yet the cost of traveling per mile in our cities is much less than in the Scotch city.

As previously stated, however, comparisons between cities in Europe and those in this country are of little value, because of the vastly different environments.

Probably the best example of the municipal ownership of an electric lighting plant is that of Detroit,

Mich. The machinery and equipment cost that city in the neighborhood of \$700,000. Notwithstanding the fact, however, that exceptional conditions prevail in that locality, due to non-political management, according to their own report their light costs them \$100 per lamp per year, whereas Newark, N. J., pays a private company \$98.55 per year. Several other large cities could be named that pay less to private companies for light than it costs Detroit. Take for example Pittsburg, Pa., which pays but \$96.00 and Cleveland, O., where a lamp per year costs but \$94.80.

There is moreover another point which should be borne in mind in connection with the municipal ownership of electric lighting plants. The rate of taxation in towns of the latter class is shown to be considerably higher than in towns which do not own a lighting system. That the effort to sustain a municipal plant increases taxes is shown in the case of Humboldt, Tenn. The tax rate was \$1 on \$100 before bonds were issued, now it is \$1.50, and a special tax has to be levied besides to pay bonds. This is to be expected; the masses are taxed to make up for any loss the city may incur, and for the benefit of a comparatively small number of citizens who use private lights. If 10 per cent. is not set aside for depreciation, a community suddenly awakens to find a depreciated and run-down plant on their hands and the bonds coming due.

The great trouble is that many persons have an erroneous idea of what municipal ownership means. This is especially so among the masses of a community who are often induced to vote in favor of it through a mistaken idea that if the city becomes the owner of, say, an electric lighting plant, they will reap the benefits at no expense to themselves. The following rather humorous paragraph illustrates the idea that seems prevalent:

"Ye see 'tis this way. Th' city is goin' to own 'th sthreet railroads an' th' gas-houses 'an' th' illio-thrio lightin' plants an' all. The city'll own 'thim an' r-run thim f'r th' binift iv th' people, an' a ma'an instead iv payin' a nickel f'r ridin' in th' sthreet ca'ar to a la-ad he niver see before will thransfer th' coin fr'm wan pocket to another an' ring up wan fare f'r himsilf."

To enable comparisons to be made between electric lighting plants operated by private companies and those operated by municipalities, Mr. M. J. Francisco, in his valuable work entitled "Municipal Ownership vs. Private Corporations," has made up a complete list of cities in the United States that manufacture their own light and of those who purchase lights from an outside source. For each of these communities the cost per hour is given as well as the candle power per hour for one cent. Regarding the comparative cost of the two systems Mr. Francisco states as follows:

"An examination of the tables discloses the fact

that in nearly every case the cost per hour where contract is made with a private company is less than when furnished by the municipality; also that the candle power for one cent furnished by the private company is more than that produced by the municipal plant.

"An average of the cost by private companies, and representing every State in the United States, shows cost per hour to be .0252 cent, while they furnish on an average 654 candle power per hour for one cent. The same analysis of the municipal plants, taken from every State in which municipal plants are operated, shows that the average cost per hour is .0359 cent, while they only furnish on an average 404 candle power per hour for one cent.

"This shows that the private companies are furnishing the lights on contract on an average of .107 cent per hour less than the municipalities can produce them, and also furnishing 250 candle power per hour more for one cent than the municipal plants."

From this it will be seen that on the score of economy little can be said for municipal ownership. Statistics, moreover, show that while private corporations are gradually furnishing light at lower rates, municipalities operating their own plants are steadily increasing their rates to private consumers in order to make both ends meet. As Mr. Edward E. Higgins has stated, the best solution of the problem is probably "complete monopoly, private ownership and operation, perpetual franchises and a system of perpetual profit-sharing with the municipality, joined to a remission of charges to the public if and whenever profits come to be sufficient for that purpose."

* * *

Electricity as a Tunnel Illuminant.

The lighting of railway tunnels by electricity would seem to be rapidly coming into vogue. The Baltimore tunnel is so lighted; arrangements have, we understand, been made to light the Hoosac tunnel, and now we hear that the great St. Gothard tunnel connecting Italy with Switzerland will shortly be illuminated by means of arc lamps. There is nothing very new in the lighting of subterranean passages by electricity, as several catacombs in Rome have been lighted in this manner for some time.

The advantages claimed for an electrically-illuminated railway tunnel are many. It will presumably greatly reduce the chances of an accident happening either from collision or through a broken rail, as the engineer will be enabled to see clearly for a long distance ahead—far enough at least, if the lights are properly distributed, to stop his train in time.

With a view to reducing the cost of lighting to a minimum, it has been suggested that the illumination be made automatic. This could be accomplished by placing a switch beside the rail at the entrance of the tunnel. When a locomotive reached this point the switch would be thrown and the tunnel illuminated. By such an arrangement current would be consumed only while a train was passing through the tunnel, for on emerging from the latter another switch would automatically be thrown which would extinguish the lights. The principal argument however brought up in favor of such an arrangement is the benefit which would be derived from it as a means of signaling, for should a train approach a tunnel through which there was but a single track and the lights were burning, the engineer would know immediately that another train had already entered. In the case of a tunnel with double tracks, the lights might be placed over each track alternately, each row of lights being controlled by a switch on the track over which the lights were placed. This would enable an engineer of a train about to enter a tunnel to tell at once whether there was a train already in the tunnel on his track.

An arrangement such as this should greatly add to the safety of travel.

Valuable Papers Stolen.

The Sprague Electric Company, which occupies a suite of offices in the Commercial Cable Building, New York, announced some days ago that a number of valuable papers had been stolen from a desk in room 1509. These papers were of so much importance that the company immediately on the discovery of their disappearance offered a reward of \$1,000 for information which would lead to the arrest and conviction of the thief. Our representative called at the company's offices and was informed that the papers which have disappeared were not as has been intimated drafts of new inventions, but were comprehensive reports made by the company's engineers on the workings of lines in Chicago and other cities which have been equipped with what is known as the Sprague multiple unit system of electrical propulsion, invented by Mr. Frank J. Sprague. These reports were especially valuable to the above concern as they had been compiled at considerable trouble and great expense, in view of the possible installation of that system on railway lines in this and other cities. Our representative was informed that as far as the memoranda are concerned they can readily be duplicated. It is naturally embarrassing, however, for the company to lose them, for it is impossible to tell what use might be made of the information which they contain. It is to be hoped the thief, whoever he may be, will be apprehended and the reports recovered.

* * *

Electric Headlights.

A paper by R. C. P. Sanderson entitled "Fads, Customs and Their Cost," read at a meeting of the New York Railroad Club, attracted considerable attention owing to a paragraph which condemned electric headlights for locomotives. The passage referred to reads as follows:

"There is no longer any good purpose in putting headlights of the size of a small Saratoga trunk on the front of engines. All that is really needed is a front signal lamp of a distinctive character. There is a positive danger in using a very brilliant and powerful headlight, such as some of our electric friends are interested in, for the reflected glare off the surface of the switch lamp's lens is often so great that it entirely overpowers the light coming from the lamp, and will show apparently white light to the engineman while the signal may be standing at red or green. For safety a runner must, therefore, look for the position of a target or semaphore and not trust to the lights at night."

The above statement provoked considerable discussion and interest among a large number of railroad men, as the electric headlight was coming more and more into use and had up to that time been extremely well thought of.

With a view of ascertaining whether there was any foundation for Mr. Sanderson's statement, it was decided to make a thorough test of the electric headlight, and settle the question as to whether it prevented the color of signal lamps from being distinguishable.

The experiment was recently carried out on the Peoria and Eastern division of the Big Four Railroad. A number of section men were stationed along the line with vari-colored lanterns between Indianapolis and Brownsburg. The different colored lanterns were distinctly visible from a half mile to one and a-half miles ahead of the locomotive, the red light standing out especially clear in contrast to the pure whiteness of the electric headlight. It was also stated that the green light, which is considered the most difficult light to make out, was plainly discernible.

Contrary to Mr. Sanderson's statement, it was ascertained without a doubt that the pure white light of the electric arc magnified and strengthened the different colored lights by the contrast. This important point having now been settled so satisfac-

torily, undoubtedly many roads will follow the example set them by the Big Four and proceed to equip their locomotives with electric headlights.

Under the Searchlight.

Notes and Comments on Various Topics.

No Faith in the General Electric Company.

The *Standard* of Watertown, N. Y., says:

The Thomson-Houston International Electric Company, or the General Electric Company, as it is now called, of Schenectady, has furnished a bond of \$50,000 in the three actions brought against it by Charles Cohen, real-estate dealer and owner of the Watertown Heights, who is suing the company for \$193,000 for services and commission while he was engaged in the employ of the company in South Africa.

The cases were on the calendar for the present term of the Supreme Court. Attorney Elton R. Brown, for the company, made a motion some time ago before Justice Williams to have the cases put over the term. Justice Williams granted the motion, but required that the company furnish a bond of \$50,000 to cover a judgment Mr. Cohen secured it. This was on motion of V. K. Kellogg, attorney for Mr. Cohen, who stated that the company might go out of business any day.

The bond was received this morning by Mr. Kellogg from Hinsdill Parsons of Schenectady, who is one of the attorneys for the company. The bond is for \$50,000 and is furnished by the National Surety Company.

The italics are ours. We are pleased to see that at least a few persons are beginning to realize the actual condition of the General Electric Company and are not hoodwinked by glowing accounts of its prosperity.

* * *

WARDEN C. P. HOYT of Denver is said to have designed an electric spanking-chair for use in the Industrial School in that city. It consists of a seatless chair on which the refractory pupil is placed, and is high enough from the ground to allow of four paddles being operated, presumably by a small electric motor. The pupils who are made to go through this ordeal will probably no longer believe in the old saying that "lightning never strikes twice in the same spot."

* * *

At a small dinner given recently in a Western city, says the *New York Sun*, the guest of honor was a young married woman who is the proud mother of two handsome boys, both under 5 years of age. In their education she endeavors to follow a system, after the manner of most young mothers, and is very particular to live up to any rule she has made for them.

During an early course in the dinner, and in the middle of an animated conversation with her host, she suddenly paused with a startled look and cried:

"There, if I did not forget those boys again! Have you a telephone in the house, and may I use it?"

She was taken to the telephone by her host, and the murmur of her voice in earnest conversation floated back to the dining room. After a short pause she returned.

"I do hope you will pardon me," she said. "But you see, I always have Georgie and Eddie say their prayers for me before they go to sleep. I forgot it to-night in the hurry of getting off, so I just called up their nurse. She brought them to the 'phone, and they said their prayers over the wire, so my mind is relieved!"

* * *

The following from the *Louisville Evening Post* savors strongly of Munchausenism:

"A few years ago 'Dad' Wright of Salvisa, this State, had a very remarkable experience with lightning," said a gentleman from Garrard County, whose stock of good and true stories is always large. "His escape from instant death at the time was miraculous. While hastening on foot through an open field toward his home during a terrific thunderstorm he was struck squarely on the head by an electric bolt. It stripped the hair from one side of his brainpan, tore the clothing from his body, and made a crooked black stripe an inch wide down his left side from head to foot. When struck he bounced several feet in the

air and fell back upon the ground as if dead. The shaft entered the earth throwing up a shower of mud.

"At the time Wright carried in his hip pocket a loaded revolver. Every chamber of the weapon was discharged, the woodwork was burned and the metal partially fused by the heat. His left shoe was ripped from his foot. The unfortunate man lay senseless and naked for several hours in the drenching rain, but, incredible as it may seem, finally regained partial consciousness and began to stagger uncertainly about over the field. He was in this pitiable condition when discovered.

"He was soon recognized, taken in charge, and conducted to his home, where he was clothed and given proper attention.

"As a result of the stroke his teeth and toenails were loosened, his scalp almost denuded of hair, and his hearing permanently impaired. On the other hand he reaped an unexpected and decided benefit. For years prior to the occurrence here outlined he had been a great sufferer from muscular rheumatism, but never afterwards felt a twinge of pain from that disease, being completely cured of it by the terrible shock.

"The dark zigzag streak along the left side of his body, indicating the scarred path of the electric current, could never be altogether removed, although various methods were tried for this purpose. In a very short time Wright was up and around and as cheerful as a bird. From that time forth he was famous in that section as the human lightning rod."

* * *

REGARDING the recent disappearance of valuable papers owned by the Sprague Electric Company, a correspondent asks, "Is it possible that the General Electric Company has found competition in its almost exclusive industry inaugurated so successfully at Pittsburg in 1893? Is it another case of Blue Prints and ex-Detectives, Stenographers and Fire Alarms?" Not having investigated, we are unable to say.

* * *

EMIL KUNZ, a resident of Sacramento, Cal., is said to have invented a 3-ounce electric storage battery. This battery, so the inventor claims, will operate as many as fifty lights for ten hours. If this battery can accomplish what is claimed for it, which, judging from the present state of the art, would seem questionable, the problem of propelling horseless carriages is solved.

An Electric Organ.

A new organ was opened at the Seaman's Mission Church at the Bute Docks, Cardiff, last week which is worked by an electric action. This organ is supplied by the Hope-Jones Organ Company, the founder of which has devoted a large amount of skill to perfecting the electric control for organs. In this case the keyboard is placed some distance from the pipes, which enables the organist to appreciate the combined effect of the music he is playing. The electromagnets used to control each individual pipe have been illustrated and described in a previous number of our paper. The work on these electromagnets, and on the pneumatic relay by which they open the pipe, is a good example of careful design and of the accurate reproduction of interchangeable parts in quantity.—*Electrical Engineer, London.*

Tungsten Steel for Magnets.

Valtropia tungsten steel having been highly commended for permanence of magnetization and high permeability, MM. C. Chistoni and G. de Vecchi, says *Industries & Iron*, London, have carried out some elaborate experiments with it in order to test its alleged excellence. One specimen examined contained 6.25 per cent. of tungsten, 0.99 per cent. carbon, 1 per cent. manganese, 0.19 per cent. silicon, and the rest iron. Another specimen contained 4.15 per cent. tungsten, somewhat less manganese and more carbon. Comparing their magnetizations in various fields with those obtained by Barus and Stronhal, they were found to be superior to the latter. The specific magnetic moment given by these latter observers as the maximum is 23.5, whereas the maxima obtained from the Valtropia specimens were 47.6 and 55.6. As regards the demagnetizing influence of time, this is said to be not felt at all except after magnetization in the

strongest fields, and the experimenters assert that after exposure to a comparatively weak field the magnetic moment goes on increasing independently for some time. After saturation the time required to reach a stationary condition differs in various specimens, being longer in thick rods than in thin ones.

OBITUARY.

J. H. Rhotemhamel.

We are much pained to announce the death of Mr. J. H. Rhotemhamel, President of the Columbia Lamp Company of St. Louis, Mo. Mr. Rhotemhamel had been complaining for some time, and the first of the month he was advised to visit Hot Springs, Ark., for rest and treatment. Shortly after the treatment was begun he became quite seriously ill, although no instant alarm was felt or fatal consequences apprehended. After a change of physicians his family was advised to return home with him. He returned to St. Louis on February 16 and died on the morning of the 17th from congestion of the brain.

Mr. Rhotemhamel was a unique figure in the electrical industry. His struggles with the General Electric Company over lamp patents and his success in setting up the Goebel defence are doubtless well remembered in the trade; also his subsequent services in the formation of the present Lamp Pool.

ELECTRICITY was decided in its opposition to this Lamp Pool, and in its strictures may have spoken somewhat severely of Mr. Rhotemhamel for his connection with it, but for all that we sympathize most deeply with his family, and sincerely regret his demise, for he was a man endowed with personal characteristics that endeared him to every one who became intimately acquainted with him. We never for a moment doubted Mr. Rhotemhamel's earnestness of purpose, but we were obliged to most decidedly disagree with him in his views maintained during the last few years.

The disappearance from our midst of one who by his abilities and force of character attains eminence in any branch of human industry is to be deplored, and by the death of Mr. Rhotemhamel the electrical trade loses a man whose views were so original and pronounced as to make him an object of interest to all those connected with it. ELECTRICITY tenders its condolence to the relatives and friends of the deceased.

Motions of Membranes Between Electrolytes.

The phenomena of electric osmose have been utilized by physiologists for the explanation of organic processes, says *The Electrician*, London, but in all applications up to the present it has been necessary to assume that a large quantity of electricity passed before any perceptible change of configuration was produced. But that this is not necessarily so, and that certain molar movements may be produced instantaneously, has lately been shown by F. Braun. When two electrolytes are divided by a semi-permeable membrane, and a current passes from one to the other across the membrane, part of the electrolyte is conveyed into the substance of the membrane, and modifies the tension of the latter. This tension differs with the substance, and hence a reversal of the current will produce a further tension or a relaxation of the membrane, according to its direction. This may be made clearly visible by immersing a vessel filled with one electrolyte, and closed on one side with an animal membrane, into a tank containing another electrolyte in solution.

The vessel ends at the top in a gauze tube, which, half filled with the liquid, indicates the slightest motion of the membrane. Electrodes are immersed in the vessel and in the tank. Motions such as those observed have some analogy with the motion of the interior nerve substance, or the changes of form exhibited by amoebae when under the influence of an electric current. [*Wied. Ann.*]

POLYPHASE MOTORS.

Mr. Paul Boucherot recently read a paper before the Societe Internationale des Electriciens on the properties of polyphase motors with short-circuited armatures, with particular regard to their starting against a load. It is well known that the curve representing the torque of such a motor at different speeds takes very different shapes with different resistances in the armature circuit. If this resistance is small the starting torque is also small, although the current taken is very large. The torque then increases with the speed up to a maximum, and falls to zero again at the synchronous speed. The author proceeds to argue that if the resistance of the armature circuit is sufficiently great it is possible to get the torque varying inversely as the speed, which he considers to be a condition required for industrial purposes. Such a motor would, however, have a large percentage of slip at normal speeds. He proposes to get over this disadvantage by having two windings on the armature, one of low and one of high resistance. Then the sum of the two curves of torque would be a curve still decreasing with increase of speed, but at a much smaller angle, and the slip at normal speed would be smaller.

The armatures of such motors can be designed with two concentric series of holes. The external holes contain the high-resistance squirrel cage, and the interior holes the low-resistance squirrel cage. The inner and outer holes are connected by a groove tending to keep down the self-induction of the circuits. In starting, the author claims that the outer cage only acts, and he states that the low resistance of the inner one chokes back all lines of force tending to cross it. The high speed of the revolving field tends to assist this action. On the other hand, at full speed the low-resistance cage does practically all the work.

The author says that the only inconvenience of this motor is a low power factor. This comes out at 0.7, but he adds that this is not so important as is thought by some. Another type of motor for the same end consists of having two armatures and two field magnet systems. These last are so arranged that one can be displaced radially round the axis. With motors constructed on the above principle by Messrs. Brequet, a starting torque of 2 to 2½ the normal is obtained, with a current only the same proportion bigger than the normal. This is not anything especially good, as better results have been obtained by German manufacturers. In the first place, the reasoning is faulty, as the ordinary low-resistance armature does give a torque decreasing with the speed after the maximum has been passed. As the motors are necessarily worked above this maximum, no alteration is required, and the added resistance causes the speed to vary greatly with change of load. It also means loss of efficiency. Better results can be obtained by differential coupling of the armature circuit at starting, as devised by Mr. Görges and others.—*Electrical Engineer, London.*

A New Form of Fuel.

The attempts made from time to time to produce substitutes for coal, wood, etc., in the form of solid petroleum for fuel, have now assumed a more practical character in an article produced by G. H. Fullerton of Los Angeles, Cal., which is claimed to be free from the drawbacks heretofore characterizing material of this sort. By the use of certain chemicals and a peculiar treatment of petroleum in its crude state, he makes a black solid mass, which in some forms breaks almost with a fracture; it burns in the same manner as coal burns, but without so much smoke as is the case with ordinary coal, costs at the present price of oil less than \$5 a ton, and may be depended on to give out between two and three times the heat units that the same weight of coal will produce. The material may be made into any form of brick, is much cleaner than coal in handling, and has little of the characteristic petroleum odor.

THE CALCULATIONS OF THE ELECTRICAL RESISTANCES OF ALLOYS AND THEIR APPLICATION TO THE FINDING OF ALLOYS OF DEFINITE ELECTRICAL PROPERTIES.*

BY C. LIEBENOW.

(Concluded from page 84.)

We will now endeavor to ascertain how the electrical resistance of alloys must change if the percentage of their constituents is varied in cases in which the two metals are assumed to be capable of forming chemical compounds.

If we assume that the molecules of each metal consist of two atoms, pp for one metal and qq for the other metal, and if we assume that a chemical compound will exist of which the molecules contain the atoms pq , then if we add to the metal pp small quantities of the metal qq , taking care that the necessary conditions for the building of the chemical compound will be fulfilled, we will obtain at first, as is clear, an alloy which contains pq molecules and the remaining pp molecules. If we increase the quantity of qq then we shall finally reach a point where only pq molecules are contained in the alloy. If we still further increase the percentage of qq no more pq molecules can be formed, but the mixture will consist of the pq alloy plus the metal qq , and as we increase the percentage of qq we are constantly approaching a condition in which we have to deal with the pure metal qq alone.

In what way must the specific resistance of the alloy change in such a case? In the case of a simple

FIG. 31.

metallic compound in which all the molecules are of the same kind, thermo-electric forces could not exist. For these cases therefore the second member of our equation vanishes. As however this is the only member which causes the high temperature coefficient of pure metals to be decreased for alloys, then there is no reason for the existence of a small temperature coefficient in a metallic compound of pq molecules. If from these considerations we draw the conclusion that metallic compounds have a high temperature coefficient similar to the pure metals, then we must confess that this conclusion, which resembles an interpolation, is not a necessary but a highly probable one. If at first we add a small quantity of qq , by which an alloy $pp + pq$ is formed, we may anticipate that in this case the temperature coefficient will decrease, but later on will increase again until we reach the simple compound, where the coefficient will have about its originally high value. As soon as we pass the stage of the simple compound, by adding still more qq molecules, the temperature coefficient must again be reduced, and after reaching a second minimum it must increase again to about the original value, 0.004. The curve therefore must have an inverted peak at the point where it represents the metallic compound.

In regard to the specific resistance we are forced to conclude that the curve must first show a sharp rise until a maximum is reached, from which point it

drops down again to a point representing a simple metallic compound, and from this point the increase and decrease is repeated again exactly as the curve of the resistances shows an inverted peak where it represents a simple compound.

It is possible to construct a third curve which is much more flat than the other ones. If we substitute the conductivity for the resistances and mark them as end co-ordinates in a table like Fig. 31, and if we assume that these metals do not cause any increase of resistance when mixed with each other, we would simply have to connect the two points by a

FIG. 32.

straight line in order to find the conductivity for the alloys mixed in any proportion. By the aid of the temperature coefficient this hypothetical conductivity can be at least approximately computed. If we again consider our approximate equation,

$$\gamma = \frac{A}{R} \alpha$$

where A designates the resistance in case an increase did not take place by a mixture.

$\frac{1}{A}$ then represents the corresponding conductivity.

If therefore this equation was strictly right, then

$$\frac{1}{A} = \frac{0.004}{\gamma R},$$

which would necessarily represent a straight line. As this equation however is only approximately correct, it follows that the product of the observed resistances and observed temperature coefficients divided into 0.004 must not exactly lie on a straight line but on a flat arc.

Assume that the condition for a metallic compound

FIG. 33.

exists, then this arc will extend only to this point and will continue from it under a certain angle to the next compound or to the other pure metal.

We have therefore two peaks and one point of inflection, all three of which belong to the same abscissa, which indicates the proportion of mixture of the two simple metals in the newly compounded metal. This proportion of mixture however we will have to expect to fulfill a fourth condition, viz., that it stands in a simple relation to the atomic weight of the metals.

If these four conditions are all fulfilled we will be justified in drawing the conclusion that we have a chemical combination of the two metals to deal with.

Under all the series of observations which have come to my knowledge I have found as yet only one where I could prove the existence of a metallic compound with certainty. But even this series is not complete, and it does not even reach to the compound itself, but nevertheless it seems to me that any doubt of the existence of the compound is excluded, as I will now show.

If you will look at Fig. 31, which represents a series of observations made by Haas on copper-zinc alloys, the ordinates of the heavy black points are the specific resistances observed by Haas and the abscissae indicate the composition of the alloys in percentage by weight. Haas has connected the observations shown in Fig. 31 by a curve. In the same diagram he has marked in the observations of Matthiessen and Wiedemann—the former as crosses, the latter as circles. You will see to what a large extent these observations deviate from Haas's curve. Haas thinks these deviations due to impurities, but states himself in another place that Matthiessen has taken much greater pains in making his alloys than he has himself. Prof. Wiedemann certainly has not failed to take proper care to prepare his alloys in a pure state. If we now find that all three observers (Matthiessen, Wiedemann and Haas) have arrived at different results, I find in this one more reason to suspect in this case the existence of a metal compound.

If, perhaps, in preparing the alloys, accidentally the conditions are not fulfilled under which the one of the metals totally compounds with the other one, then in such case an alloy must result consisting of three metals which in general may have a still higher specific resistance.

FIG. 34.

In this way the three observers, taking apparently the same percentage composition, have produced three entirely different alloys, and therefore found each widely differing specific resistances.

We will examine the curves drawn by Haas somewhat closer. Fig. 32 is the curve for the temperature coefficient. This curve shows that with increasing amount of zinc the temperature coefficient falls off very rapidly in the beginning, reaches a minimum and rises from that point about equally as fast as it fell before. The last observation is for an alloy containing 17 per cent. zinc. Here the temperature coefficient is already as large as it was for an alloy with 2 per cent. zinc. It follows from this that the state of a metal compound must be already closely approached. A copper-zinc compound which contains one atom of zinc for every atom of copper will contain 50.6 per cent. by weight of zinc. We can therefore suspect the existence of this compound in the alloys observed by Haas. The same conclusion can be drawn from the curve of resistances (Fig. 33). The left hand curve is drawn by Haas. I have added in the diagram two further observations made by Haas of pure zinc and zinc containing very little copper. The alloys lying between the end of the curved and the last two observations were so brittle that Haas could not draw them into wire. You will however notice that the form of the curve is indicated as theory requires. The curve increases rapidly in the beginning, reaches a maximum and falls

* Paper read before the Elektrotechnischen Verein on Nov. 28, 1897. (Translated for ELECTRICITY.)

down with equal rapidity. Then the curve is broken off because the following alloys were, as already mentioned, too brittle to be drawn into wire. Only two more observations were made, of which one relates to pure zinc, the other to zinc with a very small percentage of copper. The latter one indicates an increase of resistance by the addition of copper. You will notice that the two existing parts of the curve run exactly as the theory requires in the case a copper-zinc compound exists. If we now compute

from the observations the flat curve $\frac{1}{A}$ by multiply-

ing the resistance and temperature coefficient for every observed alloy and dividing this product into 0.004, we obtain the values which are marked in Fig. 33 as crosses. With the exception of one, these points lie on a flat arc which is concave toward the abscissa, and whose chord is represented by the straight line in the figure.

If there was no metal compound existing, this flat arc must tend to reach the value for pure zinc, which however is not the case. If we therefore continue the chord only to the abscissa 50.6, for which the metals are present in proportion of their atomic weights, and if we draw from this point another straight line to the cross for pure zinc, we obtain the line (in case no other compounds exist in the unobserved region) around which the further values of $\frac{1}{A}$ of the unobserved alloys must lie on a flat arc.

As the observations agree very closely, I have tried to express the values by my formula. I obtain the following equation:

$$R_0(1 + \gamma t) = \frac{1}{\frac{\% \text{ Cu Zn}}{2.9(1 + 0.00515t)} + \frac{\% \text{ Cu}}{1.58(1 + 0.00432t)}} + \frac{1000}{\frac{\% \text{ Cu Zn}}{333(1 + 0.0006t)} + \frac{\% \text{ Cu}}{1}}$$

In this equation the temperature coefficient of the internal molecular conductivity for heat of the copper is again taken as 0.0006, and this coefficient for the copper-nickel is negligible.

Fig. 34 shows the curve of resistances computed from this formula, and Fig. 35 shows the curve of the temperature coefficients. The latter one exhibits an especially close and good agreement between the values of observation (crosses) and the computed curve.

By a repetition of the experiments it may be possible to reach a still closer agreement after the preliminary constants herein given are correspondingly connected.

The last curve for the temperature coefficient shows that our formula holds good just as well when metallic compounds exist as in simple mixtures. It is only necessary to use the volumes of the compounds and not those of the single constituents in the calculations. If the volumes of the single metals are used erroneous results are obtained. As we are able to compute the temperature coefficient at least approximately from the simple formula

$$\gamma = \frac{A_0}{R_0} 0.04,$$

we have in this a guide, in case only a few observations are made, to judge if the metals are building a compound or not.

If from this standpoint all observations of Matthiessen are considered, we find that we have a reason to assume the existence of a metallic compound only when one of the metals zinc, tin, lead or cadmium is alloyed with any other metal.

This proves that these metals either always or at least very easily form compounds if melted together with the other metals. The difference in the behavior of this as compared with other metals I believe is caused by the fact that their molecules con-

tain in the solid state, and also in the liquid or gaseous state, only one atom, whereas the molecules of the other metals consist of more than one atom.

It is not necessary to melt metals together in order to form metallic compounds (compound metals), but they can be formed also in the cold state.

If we cover platinum, for instance, with zinc electrolytically, we are not able to peel off the zinc like a copper deposit. Even if we use strong acids which easily dissolve zinc, and even when we pulverize finely the zinc-covered platinum and treat it with acids, we cannot completely remove the zinc in any of these ways. It is apparent that zinc has gone into chemical combination with the platinum.

The condition for the chemical combination is in any case that the equilibrium for their combination is a more stable one at that particular temperature than that for a simple mixture. The atoms of the compound must hold themselves more strongly together than in a simple mixture. These conditions however will change with the temperature. We now assume that below the melting point of a certain metal composition there is a temperature at which the equilibrium for the compound is the same as for the simple mixture. And we will further assume that above the melting point one and below the melting point the other is overpowering. If we now form the composition by melting the metals together and then cooling the alloy as quickly as possible, the solid metal will not be in a state of internal

FIG. 35.

equilibrium. But in solid bodies, also, chemical actions go on very slowly, and in proportion much slower the lower the temperature is. In such a case, therefore, the internal constitution, and without it, for example, the electrical resistance, will slowly change. Such an alloy has been found by Feussner in the copper-nickel zinc alloys. Simple copper-nickel alloys do not change their resistance. If they however contain zinc, the resistance changes slowly. These changes will go on for years in the cold. If they are heated however to a temperature from 100° C. to 150° C., not only their resistance changes within a short time but also their structure. They become crystalline, brittle, and fall apart. Whether the compound is formed later on, or whether the compound which has been formed at a high temperature decomposes at a lower temperature is uncertain. These are matters that require further investigation.

If however a metal compound is more stable than a mixture at a low temperature, it requires more work to separate the molecules than would be required for the separation of molecules in mixtures. The so-called tension of dissolution is depressed, the compound metal is harder to be dissolved in acids, and it approaches in its properties those of rare metals. I have reasons which make me suspect that there exists a compound of copper-wolfram and lead which in many respects has similar properties to the expensive metal, platinum.

The conductivity for electricity also changes as soon as the compound is formed. The above-mentioned copper-zinc compound, for example, has a better conductivity than would be anticipated from the proportion of its parts.

If therefore we investigate all possible combina-

tions of metals, we may probably find compounds of exceedingly high conductivity, probably higher than silver or copper.

But would it not seem likely that such alloys might have been found accidentally a long time ago?

This is very improbable, as we have seen that small additions reduce the conductivity to a considerable degree. If therefore one of the two metals is slightly in excess, or if all the conditions were not complied with by which the metals are completely compounded, then we shall always have relatively high resistance.

The possibility however to study all these conditions is given to us if we compute the resistances of the series of alloys as I have shown you.

ERRATA.—In the equation of the above article near the top of page 69 of our issue of February 9 the multiplication sign in the denominator of the fraction should be a plus sign. On pages 83 and 84 of our issue of February 16 all the multiplication signs in the first four equations should be plus signs.—ED.

ELECTRIC LIGHTING FOR PROFIT.*

BY ALEXANDER DOW.

This subject is one which every member of this Association has studied and concerning which every member must have opinions. I have selected it for the paper which your Secretary asked me to present at this meeting, because I have opinions of my own which I think may be of interest to other electric light men, and which I want to hear discussed and criticised and contradicted by you who are qualified by experience to do so.

I submit as the first proposition that we are all in business to make a profit. I don't expect to be contradicted on that proposition, although some may wish to so amend it as to indicate that they are at present content if they can avoid a loss. As a second proposition I submit that the conditions of the electric light industry have so changed in the last few years that the opportunities of profit are limited; that the margin between earnings and expenses tends to vanish and can only be kept in view by unceasing endeavors to increase the one and reduce the other. The days have departed when a neat dividend could be paid on a small business done at high prices, and now if a dividend is to be paid at all it must be earned by doing all the business that can be obtained and at prices set but little above the actual cost of production. As the preceding statement forms the text of this discourse I ask your attention to its repetition, as follows: I believe that the proper policy of electric light management under the conditions of the present time is to sell electric energy to every accessible user in any shape that the user requires, and at the lowest price which will pay a reasonable profit on the capital invested.

A NEW POLICY FOR NEW TIMES.

Those of you who were in the business at its beginning will recognize in this profession of faith the converse of the rule which then governed us. We used to believe in a "system," and the people who taught us to so believe charged us so much for the experience and the incidental machinery which we acquired that we in turn had to collect great prices for the product sold to our customers. The rule was to get out of the business all that it would stand; and if a possible customer did not like the particular kind of energy which our "system" furnished, and thought he would like the kind which some other alleged system was supposed to produce, we considered him a heretic. Electric light was then a novelty and a luxury and a mystery, and was to be respected and paid for accordingly. Nowadays it is a thing of domestic use; the machinery for its production is sold as freely as any other machinery; the principles governing its distribution are taught to all who desire to learn, and its supply is recognized as a customary or even necessary public service

* Paper read before Northwestern Electrical Association, Milwaukee, Wis., January 19, 1898.

exactly as is the supply of gas and water. It is proper that we should announce a policy suited to the new condition. That many have done so I know, and also that some have long been governed by just such a policy as I advocate; but there still remain, to the detriment of the business at large, some who are trying to run their affairs on the old plan. They do not profess to do so, and if challenged they may plead the old excuse, that the cost of their plant and the losses incident to its first operation have been so great as to require high prices for the energy sold. That excuse is not valid in these latter days. Taxing customers all they will stand means competition either by an opposition plant or by the municipality; and either of these means ruin to the station which is run on the old lines.

Of course I do not intimate that any member of this Association is managing his business to-day after the fashion of the eighties. But each of us knows of some plant in the next town to ours which is run just that way. That plant is going to fight it out on the old line until it is wiped out by a municipal plant, and the municipal plant will publish a report to the whole United States that it has reduced the price of lighting thirty or forty per cent. Then you and I and each of us is going to have the trouble of explaining at great length to our own particular municipal authorities why a municipal plant established in our town cannot possibly make any similar reduction.

Gentlemen, the man who used to sell experience to us is probably to-day trying to show the ambitious city fathers of that other town next to ours how well they can serve their constituents and how much honor they can obtain from society at large by engaging their municipality in the electric lighting business. Our friend with experience to sell is not one bit more exact in his statements than he used to be long ago, and we cannot honestly say that his operations are beneficial to our business; but he is less detrimental than the man who gives him a chance to get in his work, the man who ought to be giving good service to a satisfied constituency, but who is furnishing lights that are a disgrace to the "system" and its owner, and trying to collect higher rates than those at which you and I are giving first-class service to our public.

WHAT IS A REASONABLE PROFIT?

This is a much-discussed question. The man in the next town believes that a reasonable profit is everything he can get, and at the other extremity of belief is the man who holds that no public service should pay a profit to any individual. Between these limits will be found the opinions of the great majority of Americans, whose democratic training has taught them that the commonwealth should not undertake any work which can be satisfactorily performed by private enterprise. Those members of this great majority who have money invested in manufacturing or in commerce, recognize that a reasonable profit means something more than can be obtained by the investment of their funds in Government bonds or by placing them in a savings bank, and yet something less than is hoped for when the investment is of a speculative character, involving risk of total loss of capital, such as the exploiting of a new mine or the insurance of an overdue vessel and its cargo.

I believe that after operating expenses are paid and any deterioration of the investment shown by a carefully made inventory has been made good, a dividend such as is paid by a good manufacturing business is reasonable for electric lighting. Such a dividend will necessarily vary with the line of manufacture—those concerns who manufacture a staple having a practically constant market being satisfied with a narrower margin of profit than those others where the production has to be varied from time to time and new markets developed at intervals. The same considerations govern in the electric lighting business. A station which is well established, has no ruinous competition to meet, is not threatened

by municipal interference, and is not obliged to continually risk money in extensions of an uncertain character, may well pay a dividend but little in excess of the current rate of interest in savings banks. The station in which all these conditions are reversed, particularly when there is a prospect of its investment being wiped out by causes which its management cannot control, is entitled to a greater return.

There is much work to be done in the education of the public to a proper understanding of the economical principles underlying this subject. The citizen who has theories about municipal service does not apply these to his own affairs, nor will he apply to his theories the rules which govern his personal practice until you show him that this should be done. He thinks it no harm that he should draw from the capital invested in his own business ten or fifteen or twenty per cent. in addition to a fair salary for management and any loss that is shown by the annual inventory. He thinks it entirely proper that he should build up a business worth much more than its nominal capital by returning into it a large annual surplus. But he will denounce as extortionate an electric lighting company which pays a good deal less than ten per cent., and for such a company to show a surplus is in his eyes *prima facie* evidence of robbery of the public. He on the one hand refuses to protect the public service corporation from unlimited competition, and on the other hand demands that it do business for a rate of profit accepted only on the safest class of investment bonds.

In Europe they are more logical. They limit the price which a company may charge to its customers and the dividend which it may pay to its stockholders. They require the company to give good service to all who demand it within a certain area. But at the same time they permit no competitor to enter the same district, and they provide for the purchase of the property at a reasonable price in the event of the franchise not being renewed at its term. Where they restrict they also protect. Our theorists have yet to learn that these two actions should go together, and it seems to be our affair to teach them this lesson.

HOW SHALL RATES BE MADE?

There has been of late much discussion of this subject at Conventions and in the electrical press, and with good reason. American practice has heretofore been to make rates without sufficient analysis of cost, and particularly without attempting to make each unit of energy sold bear its proper share of the standing charges of the plant. Premising that we are to readjust rates for a minimum profit, we must do so according to a carefully considered system. It will not do to make a horizontal cut on the present schedules, because analysis will show that some business now done at the highest rate is not profitable, and a reduction of rate should only be made on business that is profitable.

It has been said that American customers insist on a uniform rate—a "one-price American plan" method of charging. I do not find it so. I have no difficulty in explaining to those customers whom I meet why some business should pay a higher rate than other business; and other electric light men tell me that, after they have got the principles involved clearly defined in their own minds, their experience with customers is similar to mine.

The base of any system of rate-making must be an analysis of the costs of production. The method of analysis which I have found most useful is that proposed by Mr. Arthur Wright. The paper read by that gentleman at the last meeting of the National Association is doubtless familiar to you, but as American conditions usually differ from those existing at Brighton, it is seldom possible to apply the short method of estimating standing and running costs which Mr. Wright found convenient, and an analysis in detail must be made. I use the following method. Consider what the condition of the station would be if you were obliged to be ready to do the same busi-

ness that you now do and during the same time but had no customers taking current. You would have fires lighted, men on duty, dynamos turning over, lines strung and connections made to customers' premises. You would burn enough coal to keep up steam and keep the dynamos in motion, and you would have enough help for these conditions. But you would not burn so much coal as if the machinery were running at full load; and you might need less help. Your lines would be out in the weather or buried in the ground, and that deterioration which is due to time and to climate would go on just the same and would have to be made good by a repair gang. But you would not need renewals of incandescent lamps or carbons, and you would not keep any men to put in fuses for customers or to read meters. You would need a manager and an engineer and an electrician just as you do now, but you would not need a bill clerk nor a collector, and you might do without an office boy. My rule is to ask whether the item of expense under consideration would continue or would cease under the conditions described. If it would continue it is a standing charge. If it would cease it is a running charge. It is clear that taxes, insurance and interest are standing charges.

Mr. Wright has shown us that it costs us a great deal of money to get ready to serve a customer, even though the customer only requires service for a single hour in a year. This amount he calls the standing charge. He has pointed out that a uniform rate takes no account of this, but is apparently based on the assumption that it costs just the same to furnish current to a customer for one hour in the year as for each hour of one thousand hours in a year. He argues correctly that in making rates we should take account of a customer's load factor, and he goes on to describe an ingenious method and an ingenious device invented by himself for taking such account. Whether we adopt his device or not we must all admit the correctness of his statement of the conditions governing costs of production, and we must if we are hereafter to do business at a profit make our rates with a due regard to these conditions.

To discuss in detail the whole theory and practice of rate-making is beyond the scope of this paper. I advise each of you who has not already done so to make an analysis of your costs in such manner as to distinguish between standing and running expenses. Using Mr. Wright's paper as a text book, you will find (as I did) that the labor is well paid for by the results obtained. Properly tabulated these results will show what business is profitable at any given rate or what rate should be made on any given business. My analysis showed me that I could afford to sell current to a large class of users at $4\frac{1}{2}$ cents per unit while a rate already established at $14\frac{1}{8}$ cents for another large class was not profitable. Now I am taking all the $4\frac{1}{2}$ cent business I can find and am letting other people hunt for the $14\frac{1}{8}$ cent skind.

CLASSES OF BUSINESS.

The immediate business of an electric lighting station is to supply incandescent and arc lighting, and power for stationary motors.

Some small plants limit their business to lighting, and thereby avoid operating during the daylight hours. I think that this is often done without good reason. There is in nearly every village some demand for power, or such a demand can be developed by an enterprising manager. It is likely that the rates to be obtained for power will be very low, but if they will pay the additional cost of running the station during the daytime and also carry some proportion of the standing charges, these low rates may be profitable indirectly by reducing the amount of standing charges remaining to be earned by the lighting business. It is certain that interest, insurance and taxes run for twenty-four hours a day although the plant may only operate for twelve, and if the power load will pay half of these items, in addition to its actual running cost, it is worth having.

Some stations do not run all night. The people in the village where such a station is located may go

to bed early and may not use any appreciable amount of current after 11 o'clock or midnight. But I have always found it difficult to work up a good business in residence lighting unless the plant undertook to give all-night service. Apparently customers do not care to have a duplicate lighting equipment in their residences. They do not fully appreciate the beauty of incandescent lighting if it cannot be switched on at any moment when it is wanted. People sometimes want lights between midnight and morning in their houses, and I suppose will continue to do so as long as our children come into this world with unreasonable ideas as to the part of the day in which they should do their sleeping.

I am sometimes told that residence lighting is unprofitable. It surely is if every residence that is served requires an independent transformer, and if only one residence in a dozen takes current at all. The only way to do residence lighting at a profit is to do all the lighting or nearly all that there is in a given residence district, and for this purpose the rate must be placed so that every possible customer can afford it. I have tried the experiment of low residence rates on a small scale more than once, and in each instance with success. It is to be tried now on a large scale in several stations and I am certain that the experiment will be successful. The load factor of residence lighting is much better than the average load factor of many stations.

A GENERAL DISTRIBUTION SYSTEM.

It is a serious handicap to a station when it is obliged to run two or three separate types of dynamos and to maintain two or three separate distributing systems for the supply of different forms of energy. The best practice to-day is to furnish incandescent lights, arc lights and electric motive power from the same dynamos and same mains. This is a subject to be considered in the original plan of the station, but there are instances where old stations have been rearranged with decided financial advantage. When a power load can be had even at the low rates already spoken of, a study of the local conditions should be made with a view to seeing whether a general distribution system will not be a source of profit. To design a new station with anything but such a system is almost criminal.

SUPPLY OF STREET RAILWAY CURRENT.

There has not yet been devised a satisfactory system whereby a supply of 500-volt current for railway work can be combined with a general lighting distribution. Therefore a proposal that a lighting station should furnish such current must be dealt with as involving a new investment. This investment is always the cost of dynamo and switchboard, and usually the cost of an engine. The street railway evening load in winter time coincides with the heaviest load on the lighting system for about two hundred hours per annum. At all other hours the street-railway demand is a desirable addition to the load on the boilers, and in most stations the dynamo and switchboard can be cared for without cost for additional help. If the boilers are properly designed to suit the conditions, they may be driven beyond their usual rate during these two hundred hours with greater profit than would be possible if additional boiler capacity had to be installed. Furnishing street-railway current appears therefore to be equivalent to the sale of steam to a special engine and the furnishing of attendants to an additional engine and dynamo, and it should be considered as a business proposition on that basis and not in the same manner as a demand for current from the electric lighting plant.

STREET LIGHTING CONTRACTS.

If street lights can be served from a general distribution system the rate should be made in the same manner as the rate for any other service from that system. As street lights usually run about four thousand hours a year, a rate made on a scientific basis will be very low in comparison with the rate for ordinary commercial lighting. This is not in accordance with the old practice of making all the

profit of the business on a street-lighting contract, but it is distinctly in accordance with the more modern practice which will probably become general.

Municipal contracts which can be performed without investment in special machinery are desirable business, in that the payment is prompt and absolutely secure and that the conditions of their performance are clearly laid down in the original agreement. For that reason the tendency appears to be to take such contracts at a very narrow margin of profit.

But when the performance of a street lighting contract requires an investment in special machinery and the building of special lines, such a contract is usually undesirable business. It is impossible under present conditions to secure such prices for street lighting as will return the investment to the stockholders within the term of the contract. The contracts are usually short and there is no surety of their renewal. If in dealing with a municipality one were dealing with a business corporation having an established policy it would be justifiable to take such chances, but our American cities, if they have a policy at all, change it from election to election, and no contractor can tell that the service which was deemed perfect by the board with whom he made his contract will not be entirely unsatisfactory to their successors with whom he must make a new contract two or three years hence. In this respect we have another lot of educational work out for us. If we could make it clear to the mass of our citizens that the price for a year's street lighting depended on whether the street-lighting plant would be employed next year or would be standing idle, we might have some chance to make close bids without feeling that we were engaged in a risky speculation. The peculiarly exasperating part of the whole subject is, that those same theorists who object to asking for bids on a contract running more than two or three years are usually ready to look up the good money of the citizens in a city plant which has to be security for thirty-year bonds.

SPECIAL SOURCES OF REVENUE.

In many localities there are opportunities whereby the power of a lighting plant may be employed in work which is not usually considered as part of the lighting business. An arrangement with a manufacturer whereby machinery required by the plant during evening hours will be used by the manufacturer in the daytime is often possible. A similar arrangement is made in many places for the joint use of a water power. The sale of exhaust steam for heating purposes is another source of revenue which is frequently neglected.

HOW CAN BUSINESS BE HELD WHEN ONCE OBTAINED?

In these days of competition this subject becomes of the greatest importance. We have against us in every station some competition. In the larger cities we have to meet the offers of opposition companies doing a similar business to ourselves, the arguments of the man who wants to sell isolated electric plants to our best customers, and the ever-present cheap service offered by the gas company. In the smaller towns and villages the worst obstacle to the holding of business is the tendency of our customers to economize by cutting down the amount of light used. This tendency is present also in the large cities, but is not so constantly in evidence because many city people must use light liberally in order to carry on their business. The whole law and gospel of holding business consists in getting your customers to believe that they receive good value for their money. It is not sufficient that you believe it, you must convince the customer. But it tends to make your success more certain if you know in your own mind that you really are giving good value. For this reason it is essential that you know what each block of lighting costs, which brings up again the subject of analysis of expenses.

No matter how cheaply you offer to sell your products, it is essential that the customer be satisfied with what is delivered to him. Therefore, if he

wants to use arc lights, you must see that they are quiet and steady. If he buys current from you wherewith to operate a motor, you must make it your business to see that his motor runs satisfactorily. It is not a part of your contract to do this, but if the motor does not run as it should you will go up there some day and find that he has bought a gas engine. If you sell him current for incandescent lighting, you must see that the lamps are renewed before they become dim. If you cannot get the customer to buy new lamps, you had better arrange to furnish renewals free, as most stations now do. If even then your customer is slow about calling for renewals, you had better send one of your men up to change the lamps. Neglect in this respect probably means that there will be a sale of Welsbach burners in the neighborhood of that customer. You must be prepared to send assistance to him when he mixes things so that fuses get blown, and you must send this assistance promptly. This may mean that a man has to idle around the station waiting for trouble calls, but you should not think that man's idleness gives you a chance to economize by discharging him. You should look upon it as the outward and visible sign that your customers are getting good service. And above all, you must take such precautions that your service may be relied upon by all who employ it. There is nothing that does so much to damage the business of a station as a reputation for unreliability.

CONCLUSION.

In closing I wish to say that I am preaching no doctrine which I do not believe, or which I do not try to follow. Neither do I imagine that the stations represented in this Association are less carefully planned or less efficiently managed than those of the rest of creation, that I should address myself to you rather than to others. But it is by electric light men and no others that the advice must be given to those who need it, and each of us has the opportunity at some time to counsel with the man in the next town of whom we have been speaking. While I was in the act of preparing this paper I was asked for advice in just such a case, and gave verbally just the same advice that I was putting in writing for presentation to you.

This is a final summary of the opinions I have presented:

(1) The electric lighting business should pay a reasonable profit, approximately the same rate as any manufacturing business which has similar risks. This profit should be paid after the expenses of operation, maintenance, and depreciation shown by the annual inventory have been provided for.

(2) Rates for electric supply should be so adjusted that each unit sold will pay its share of operating and standing charges, and in addition thereto a uniform proportion towards profit. No business should be done at a loss, and no business should pay more towards profit than its proper share.

(3) Every class of business that can be profitably done should be obtained. Business that improves the load factor should be taken if it can be obtained at any price greater than its share of operating and standing charges, because the improvement of the load factor reduces the amount of standing charges to be borne by the existing load.

(4) Business once obtained should be kept by careful study of and prompt attention to the requirements of each customer. It is not possible in the present stage of electric development for an American electricity supply company to limit its interest in the supply to its delivery on the customer's premises. It must do much work in order to secure that the customer uses the supply to the best advantage. It is not sufficient that a customer should be well served, he must also be well pleased.

(5) There is need of educational work to be done among electric light men, among municipal authorities and municipal theorists, and among our own customers. It is our interest that this educational work should be done, and as it does not appear to be the duty of any other person to do the work, we will have to do it ourselves.

STANDARD SYSTEM OF ELECTRICAL DIAGRAMS.

The committee appointed a year ago by the Chicago Electrical Association to make a group of diagrams of the common parts used in electrical construction, for the purpose of originating a standard code to be adopted by the Patent Office, recently submitted its report. The two first plates of a series of eight are herewith shown. The committee's report states that often in a drawing accompanying an application for a patent, when a circle was used to represent a battery, and another circle exactly like it to represent a dynamo, and still another, differing in no respect, representing the ground, the drawing was necessarily confusing, and was followed with difficulty, if at all. In such cases it has not been infrequent for the Patent Office to suggest to the inventor or his attorney that he submit a new drawing, using a certain adopted form or diagram to represent his battery

This form of diagram may be used for any direct current machine in drawings where the form of the winding of the machine is either well understood or is not essential in the system to be represented. Similarly, the figure below it may be considered the generic alternator. Where it is necessary to show particularly the kind of a machine, the field coils may be added, as shown in the next three figures, which are so simple that they can not be misunderstood by one accustomed to read electrical diagrams. In the diagram of the tri-phase dynamos or motors are shown the characteristic windings of their armatures only. Where there is room for a doubt as to whether one of these diagrams represents a motor or a dynamo a letter M or G, as the case may be, will clearly distinguish them.

The diagram representing the motor-generator will, perhaps, be subject to adverse criticism. In its adoption, good perspective is undoubtedly sacrificed

terms where it is often difficult to distinguish between the hand generators at the subscribers' stations and the power generators at the central office.

The remaining diagrams will appear in future issues.

Electro Chemical Equivalent of Carbon.

This abstract gives the conclusions of a paper by A. Coehn. When carbon is employed as the anode in the electrolysis of liquids which evolve oxygen, it is not only mechanically disintegrated but also chemically acted on, the nature of the latter action appearing to depend on the electrolyte employed. For example, a current of 0.12 ampere is passed through six cells furnished with anodes of pure carbon and cathodes of platinum, and containing sulphuric acid diluted with 1, 10, 20, 50, 100, and 500 volumes of water; after ten hours the most concentrated solution is colorless, the most dilute dark

and another to represent his dynamo, and so on. In this way, and with the well directed efforts of a number of patent attorneys, a great improvement has been made. These diagrams are to further assist in this direction.

It is well to state that no attempt at originality has been made in their selection. All available sources of information have been drawn from, and it has been the aim of the committee to adopt the best, regardless of whether they had been in common use or not. In deciding upon the diagram for any particular piece of apparatus, the question was considered from several standpoints. Simplicity always carried the greatest weight, and when several diagrams of apparently equal simplicity were to be chosen from, that one was taken which seemed most suggestive of the actual piece of apparatus represented.

The representation of a dynamo or motor by a circle with two tangent lines showing the commutator and two brushes has long been in common use.

for ease in drawing, but who can say that the diagram is not suggestive of what it is intended to represent?

The differentiation of the diagrams for the primary battery and for the storage battery from each other and from the ordinary diagram for a condenser, has been the subject of a good deal of thought. The primary battery diagram is the one in ordinary use. The storage battery diagram differs from it by having the plates connected in multiple, as in practice, and by the drawing of a square around it. This diagram will hardly be taken as representing a condenser, for the reason that the lines representing the plates of the battery are made thicker than those connecting the plates to the battery terminals.

The reason for not representing the ordinary hand magneto-generator and the constantly driven generator by the same diagram is that a need actually exists for a distinction between them. This is especially so in diagrams of telephone exchange sys-

brown, and the others of intermediate shades of color. At higher temperatures there is less mechanical disintegration, and the electrolyte is more strongly colored than at lower temperatures. The mechanical disintegration is inconsiderable at 100 degs. in a solution containing equal volumes of water and concentrated sulphuric acid. A determination of the loss of weight of a carefully purified carbon anode under these circumstances gave the number 3.5 as the electro-chemical equivalent of carbon, but some mechanical loss had occurred. A further series of determinations were made at the ordinary temperature with sulphuric acid diluted with from 10 to 500 times its volume of water, the particles of carbon lost mechanically being collected and their weight subtracted from the total loss of weight of the anodes. The electro-chemical equivalent thus determined varied from 2.7 to 3.0. The number obtained is thus independent of the concentration or temperature of the acid, notwithstanding the apparent difference in the action.—*Electrical Engineer, London.*

Electrical Tramways in Europe.

The substitution of electricity for horse traction on the tramways of the great cities of Europe is coming more and more to the fore every day, and as evidence of this, it may be mentioned that at the present moment the municipalities of Berlin, Vienna and Moscow are all engaged in the preliminaries for the transformation of the existing tramway systems. The two chief Moscow companies are negotiating with the authorities for permission to amalgamate the existing lines and utilize electric power on same. The work of installation will probably be entrusted to the Berlin firm which is promoting the scheme. As far as Vienna is concerned, arrangements are now being concluded for a trial use of electricity on part of the tramway system of this town. The *Oesterr. Ungerisches Eisenblatt* states that it has been decided not to experiment with overhead wires, but that the communication of current by means of a central track-conduit will be adopted. The work is to be jointly carried out by two firms, one of which is German, the other Austrian.

Electrical Apparatus for Great Gull Island.

On March 3, 1898, Major Leach, the United States Engineer at New London, Conn., will open bids for installing an electric light and power station at Great Gull Island, N. Y. The engine is to be a 28 BHP. oil engine of the Hornsby-Akrod type, provided with oil tank, water vessel, and water and exhaust connections, supplementary governor and two flywheels. The generator is to be one multipolar 15 kw. direct current, constant potential, compound wound, belt connected, 250 volt dynamo, provided with a rheostat that will regulate the voltage from 5 degrees above the normal to 20 degrees below, and with a switchboard for cutting out compound winding, and shunt-field arranged to secure the maximum rated voltage of the generator. The generator must be of the latest and most efficient type. The armature is to be of the type known as ironclad. It must be capable of running its full rated capacity for five hours continuously. Three switchboards are required. The conductors are to be insulated according to U. S. Navy specifications, to be of soft-annealed pure copper wire, heavily and evenly tinned, and having a conductive of not less than 96 per cent. of pure copper of equal cross section. Two storage batteries are required, each to consist of 54 chloride accumulator cells complete, with glass jars, oil insulators, bolt connections and sand trays.

Intending bidders desiring any further particulars can obtain same upon application to Major Leach.

The Harrisburg Foundry & Machine Works.

On February 1st Mr. M. E. Hershey, general manager of the Harrisburg Foundry & Machine Works, Harrisburg, Pa., severed his connection with that company, and Mr. W. R. Fleming of the firm of W. R. Fleming & Co. of New York, Boston and Philadelphia, has been prevailed upon to accept the position of vice-president and general manager of the works. This change took effect February 1.

The Harrisburg Foundry & Machine Works contemplate a considerable increase in their facilities for manufacturing automatic engines for electric service. It is intended to add several new lines of engines so as to broadly cover the whole field of steam-engine practice.

It is also understood that the company will rebuild their entire plant upon a plan and scope which will place the concern in a superior position for the manufacturing of their machinery, which is so well known throughout the country at large.

Bids Wanted.

Sealed proposals are being invited until March 24, 1898, for electric lighting and power installation at Plum Island, N. Y. Specifications and blank forms of proposals can be obtained upon application to Major Smith S. Leach, United States Engineer, New London, Conn.

LONDON NOTES.

[From our London Correspondent.]

Cathode and Roentgen Rays.

On February 4, at the Royal Institution of Great Britain, Mr. A. A. Campbell Swinton lectured before a distinguished audience on "Some New Studies in Cathode and Roentgen Radiations." In Crookes tubes it was possible to deal, not with aggregates of matter but with a few, perhaps, single molecules, and this was the reason why so much attention was being devoted to this branch of physics. Mr. Swinton showed experiments to illustrate the deflecting power exercised on the cathode rays by a magnetic field; and the erosive action of the rays upon the glass of the tube was also exhibited, the glass being roughened on the interior surface. A cathode ray electric lamp was used for focusing the rays from two concave electrodes on a piece of lime, which, under their influence, was raised to brilliant incandescence. One effect which he was at a loss to explain was that the lime glowed brightly and faintly in alternations; moreover, although an alternating current was used, the light appeared now on one side of the lime, now on another. In regard to the nature of the cathode rays and the distribution of the electric field within the tube, he pointed out that a pith ball, which might be taken to represent an atom, vibrated with equal velocity in each direction between two electrified plates, but that if one of the plates were connected to earth instead of to the electric machine, the vibrations were slower in one direction than in the other. Analogous conditions he conceived existed in the tubes. The bulk of the atoms were positive and moved with comparatively small velocity, only those behind the cathode and those forming the stream coming off from the cathode being negative and moving at a great velocity. The existence of an anode stream could be proved experimentally by means of a tube containing a revolving vane (like a radiometer) whose position was variable at will. Put in the cathode stream it rotated very quickly in one direction, but if brought closer to the glass it came under the influence of the stream of positively-electrified atoms from the anode and rotated slowly in the other direction.

Personal.

Mr. O. C. Hirtzell, treasurer of the Eureka Tempered Copper Works, North East, Pa., was in New York last week on business. He spoke encouragingly of the business outlook and reported his own works as running overtime to fill orders.

Mr. John McKay, who has been engineer and superintendent of the Electrical Exchange Building for some time, has been appointed supervising engineer of the following large buildings in New York: American Surety Building, Queen Insurance Company Building, German-American Building, White Building, Parmley Building, Sohermerhorn Building and the Electrical Exchange. The position of supervising engineer for these large office buildings is a very important one, and the selection of Mr. McKay is a recognition of his ability as an engineer. His promotion was deserved and places the right man in the right place.

The General Offices of the National Association of Manufacturers in Philadelphia, including the office of the president, Theodore C. Search, have been removed from No. 1743 North Fourth street to the Bourse, Fourth street below Market.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

Telegraph Tournament at the Electrical Exhibition.

An exceedingly interesting feature of the Electrical Exhibition to be held in Madison Square Garden, New York, next May, will be the telegraph tournament. An educational committee has been appointed to look after Exhibition matters other than commercial, and this committee has decided that one or more evenings during the Exhibition shall be set aside for the telegraph tournament. This will undoubtedly be the greatest tournament of the kind ever held in the world. Mr. Fred Catlin, well known in telegraphic circles, has consented to conduct the affair. Judging from the number of previous successful tournaments Mr. Catlin has managed, the contest next May should be eminently successful. Mr. James D. Reid, of world-wide reputation, is to be chairman of the board of judges.

It is the intention of the management of the Exhibition to spare no efforts to make this feature of the great show a most attractive and successful one. The prizes will be unusually liberal and the contests numerous. Those who desire to participate in the tournament may depend upon being well taken care of.

Meeting of the New York Electrical Society.

The 185th meeting of the New York Electrical Society, in conjunction with the New York section of the American Chemical Society, was held at the College of the City of New York, February 11.

Mr. Joseph Wetzler lectured on "Electricity Direct from Carbon."

Dr. Chas. F. Chandler, Dr. Morris Loeb, Dr. E. A. Doremus, Messrs. Samuel V. Essick, C. O. Mailoux, J. J. Carty, T. C. Martin and Max Osterberg took part in the discussion.

The following members were elected: Prof. Robert Ogden Doremus, Max Loewenthal, James H. Bates, Raymond W. Charles, W. L. Hedenberg, Frank Martin, F. A. Pattison, Geo. C. Hoffman, Thorburn Reid, Robert Lozier, Prof. Sidney H. Short, Geo. Sommer, John J. Swann, Meyer S. Blumberg, Frederick W. Young, Wesley Gray Gilmore, Edwin Adelbert Howe, H. F. Sanville.

Electrical Applications Awaiting Action in the Patent Office.

Among the 13,336 applications awaiting action in the Patent Office on the 15th inst. were 258 on metallurgy, metal-founding, electro-chemistry, etc.; 307 on telegraphy, telephony, electric lighting and signaling; 220 on electricity generation, distribution, motive power, electric railways, etc.

LEGAL NOTES.

Vice-Chancellor Grey, at Camden, N. J., on the 14th inst., appointed J. Frank Shull, of Glassboro, receiver for the Pitman Grove, Glasboro & Clayton Electric Light Company. The liabilities are placed at \$4,000 and the assets at \$10,000.

In the short calendar session of the Superior Court at New Haven on the 11th inst. it was stated that the settlement of all the affairs of E. S. Greeley & Co. of New York, now in the hands of a receiver, would be made in the Superior Court at New Haven. A receiver was appointed for the concern in New York, but the consideration of the claims against the concern and the adjustment of its affairs will be concluded at New Haven, where the firm had an office and where E. S. Greeley, the principal owner of the concern, resides.

At a special term of the Supreme Court at Utica, a few days ago, a hearing was given in the case of the Edison General Electric Company of Schenectady against the Western Electric Company and E. G. Bernard of Troy, for the infringement of a patent. This action is brought to debar the defendants from manufacturing a motor a portion of which, it is asserted, is covered by a patent held by the plaintiff.

In a decision handed down in the United States Circuit Court, New York, by Judge Lacombe, the

Edison Electric Light Company has been granted a perpetual injunction restraining Albert Hoohester, individually and as manager of the Central Electric Company, from manufacturing or selling a patented improved socket and receptacle for electric lamps. Judge Lacombe held that the defendant had infringed upon the complainant's patent.

The Campbell Electric Supply Company of Boston has been placed in the hands of a receiver.

Suit was commenced in the United States Court at Portland, Ore., on the 10th inst., by the General Electric Company of Schenectady, N. Y., against the La Grande Edison Electric Company of La Grande, to recover on a number of promissory notes assigned to complainant by the Northwest General Electric Company of St. Paul, Minn. The notes were given for electric machinery, and amount in the aggregate to \$5,000.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

GENERAL NEWS.

What is Going On in the Electrical World.

Albany, N. Y.—Among the bills introduced in the Assembly last week were two by Mr. Oliver, one providing for municipal ownership of railroads, surface, elevated or underground, by cities of the first class, and the other providing for municipal ownership of lighting facilities—gas, electric and other.—A bill was introduced in the Assembly compelling all railroad companies in the borough of Manhattan operated by cable or electricity to have two conductors on each car.

Boston, Mass.—The Boston Electric Light Company has entered into a contract with the General Electric Company for the equipment of the generating station now in course of erection at South Boston. The three-phase alternating system will be used. The dynamos will be four in number, each of 3,000 horse power capacity, giving a total output of 12,000 horse power. They will be of the revolving field type, a type adopted to allow of a high voltage being taken directly from the dynamo to the wires without the use of transformers to increase the pressure. The revolving field on each dynamo will be mounted on the shaft of an engine, and the voltage of the generated current will be 2,200 volts. To excite these dynamos two smaller ones, each 100 horse power, will each be driven by a synchronous motor. In addition eighteen large synchronous motors, each of 200 horse power, will drive thirty-six arc-lighting machines. Each motor will be set between two Brush 125-light arc dynamos. Up to the present the Boston Electric Light Company has operated a number of stations throughout Boston. Two of these, however, have recently been abandoned to make way for the new railroad stations now being built, and the company has, therefore, decided to consolidate all the small stations into one large generating plant, to be erected in South Boston.

Burlington, N. J.—The Monmouth Traction Company, which was incorporated a few months since for the building of a trolley road between this city and Keyport, is pushing the work forward, and it is predicted that the road will be in operation in less than a year.

Burlington, Ia.—Articles of incorporation, carrying a capital stock of \$225,000, were filed here a few days ago under the title of the American Investment Company. The object is to control certain electric light and railway interests, gas plants and other enterprises in Burlington. The officers are Col. G. H. Higbee, president; J. W. Walsh, secretary; J. T. Remy, president of the First National Bank, treasurer.

Charlotte, Mich.—Bids are desired for lighting this city for a term of years; plans and specifications may be obtained from the city clerk.

Cincinnati.—The Cincinnati Edison Electric Lighting Company is preparing to erect a new power station corner of Charles and Plum streets. The building will be of brick and stone, 205 by 107 feet, and will cost about \$75,000.

Cleveland, O.—The Big Consolidated Street Railway Company has decided to spend about \$250,000 on improvements in machinery and equipments. A new 2,000 horse power generator and engine and 60 new cars are to be added to the plant.

Coldwater, Mich.—Thomas Duncan and William F. Condon of Saginaw have been granted a three-year franchise to operate a street railway in Coldwater. This road will be extended to Coldwater Lake, twelve miles south of the city, and to points in northern Indiana.

Columbia, S. C.—The House has passed a bill incorporating the Lexington Electric Railway & Electric Power Company of Lexington, S. C. The capital stock of the company is \$25,000 but may be increased to \$100,000. The incorporators are: W. P. Roof, Dr. M. Q. Hendrix, Allen Jones, L. W. Ridd, J. A. Muller, P. H. Nelson, James W. Ogilvie, F. C. Caughman and such other persons as they may associate with them.

Denver, Col.—The "News" says: "Electricity derived from the fall of water will solve the problem of the economic working of mines in one or more districts in Colorado. Before the end of the approaching summer every mine of any prominence as well as an unlimited number of prospects and small shippers in the vicinity of Lake City will be operated by electricity from a central station, construction on which will be commenced at once by a company composed mainly of Standard Oil officials."

Doylestown, Pa.—An agreement has been signed by the Bucks County Railroad Company and the Pennsylvania Railroad Company, giving the trolley company the privilege of laying their rails beneath the bridge of the Trenton Cut-Off Railroad north of Willow Grove. All opposition has thus been removed and the tracks of the trolley road will soon be completed between Doylestown and Willow Grove, making a continuous trolley railway of 25 miles between Doylestown and Philadelphia.—Sheriff Aaron has sold the real estate and personal property of the Provident Electric Light Company of Yardley at public sale to Robert J. Peoples, for \$920. The property includes a line of eight miles of wire and poles and the lamps in Morrisville and Yardley.

El Paso, Tex.—The street railway companies in this city and in Juarez are seriously considering the question of changing the motive power of their roads to electricity. The mule is still the motive power here.

Ellicott City, Md.—The Catonsville Ice, Light & Power Company has purchased the franchises and good will of the Ellicott City Light & Power Company. The plant of the latter company was not included in the sale. The Ellicott City Company has been in operation for five or six years. The Catonsville Company is a new corporation, whose plant is now being constructed, for the purpose of supplying light and power in both Catonsville and Ellicott City and the surrounding territory.

Fargo, N. D.—An ordinance has been introduced in the city council, and received its first reading, granting a twenty-year franchise to an electric street car company. The organization is headed by President Von Niede of the Red River Valley National Bank, and J. B. Lockhart of Fargo, Bob Clendenen and Johnston Wagner of Moorhead and Charles A. Baker of St. Louis. The plan is to operate the line in both Fargo and Moorhead and to secure similar charters in each city.

Gainesville, Ga.—Charles I. Webb is at the head of a company that proposes to establish an electric light plant in this city.

Gonzales, Tex.—Several of the citizens of Gonzales have organized the Citizens' Electric Light & Power Company and have advertised for bids for construction of the same. It will be first-class in every respect. The stock is all taken to the amount of \$8,000 or \$10,000 and work will commence on the plant immediately.

Kokomo, Ind.—The "Dispatch" states that "Superintendent C. L. Harry of the electric light plant has burning in his office a novelty in the way of an electric light. It consists of a small arc lamp, in size that of an incandescent burner, provided with carbon instead of wire, and burns 100 hours. It is supplied from the alternating system and is not adjustable to the street power."

Little Falls, N. Y.—The stock of the United Gas & Electric Companies of this city was transferred to a syndicate of New York capitalists on the 15th inst. A new company was immediately formed, as follows: President, Alexander S. Cochran; secretary, Robert O'Shea; treasurer, Maitland F. Griggs; manager, W. F. Lansing, all of New York except Mr. Lansing. The same syndicate has purchased the stock of the Mohawk and Ilion Gas and Electric Company and the Herkimer plant. It was reported that they were also negotiating for the purchase of the Dolgeville generating plant, but this is denied.

Mt. Clemens, Mich.—An ordinance is to be presented superseding all franchises hitherto granted to the Mt. Clemens & Lakeside Traction Company, so as to meet new conditions arising from the consolidation of that company with the Detroit, Lake Shore & Mt. Clemens Railway.

Morgantown, Pa.—The council has voted to spend \$10,000 to erect an electric light plant.

Newark, N. J.—The Kearny Electric Light & Power Company, which has the franchise for lighting the public streets of Kearny, East Newark and Belleville, and is practically the only competitor of the great corporation known as the People's Electric Light & Power Company of Newark, has, it is stated, been privately sold to parties friendly to or interested in the latter company.

Newport, R. I.—The "News" states that Messrs. Tucker & Anthony of Boston, who conducted the preliminary organization of the Middletown & Portsmouth and Fall River & Stone Bridge railways, are financing the Montville Street Railway Company, which is to build a connecting line of fifteen miles between Norwich and New London, Conn.

Norristown, Pa.—The city council has decided to award the contract for the municipal electric light plant to the Falkenau Engineering Company of Philadelphia. The contract price was \$41,000. There were seven other bidders.

Norfolk, Va.—Ground has been broken for the Portsmouth, Pig Point & Newport News Railroad. It is expected that the railroad will connect with the Port Norfolk Electric Railway for entrance into Portsmouth. It may also connect with the "Belt Line," and thus

transfer truck immediately to the steamship lines in this harbor.

Ocean City, N. J.—The Ocean City Association has purchased the stock of the Water, Electric Light & Sewer Company owned by Superintendent E. B. Lake. The Association has decided to extend the electric railroad to Corson's Inlet.

Ottawa, Can.—The British American Light & Power Company are applying for power to construct and operate by electricity or other power tramways in Dawson City, Fort Selkirk and other points in the Yukon and northern British Columbia; also to operate heating and lighting systems.

Philadelphia.—In the annual report of Chief David Wallace of the Electrical Bureau, just submitted, it is shown that 28,632 feet of conduit and 203,591 feet of duct was laid in 1897. The receipts of the Bureau, principally for licenses on poles, amounted to \$46,304.04. The returns made by the various companies authorized by councils to maintain underground electrical structures, together with those laid by the city, show there has been placed under ground 2,379,388 feet of conduit, an increase of 31,393 feet over 1896, representing an aggregate of 17,675,306 feet of duct.

Pontiac, Mich.—The new syndicate organized by Col. Seymour Brownell of Detroit, which will commence construction of a new electric railway from Detroit to Orchard Lake in the spring, has absorbed the Pontiac & Sylvan Lake Electric Railway, M. B. Mills of Detroit, principal owner of the latter road, becoming a stockholder in the main company. Engineers have begun locating an extension of the line from Sylvan Lake to the military academy at Orchard Lake.

Providence, R. I.—A bill has been introduced in the Rhode Island Legislature authorizing the Middletown & Portsmouth Street Railway Company and the Fall River & Stone Bridge Electric Railway Company to unite and form one corporation to be known as the Newport & Fall River Street Railway Company.

Sac City, Ia.—The citizens at an election held here voted to give a twenty-five year franchise to establish and maintain an electric light plant to a local company comprising Asa Platt, D. Carr Early, Judge S. M. Elwood and others.

Schoolcraft, Mich.—Although the proposition to bond the village for electric lights and waterworks was recently defeated by a failure to secure the necessary two thirds vote, there is still considerable sentiment expressed here in favor of electric lights, and it is probable that a proposition for them alone, without the waterworks, will be voted upon at the spring election.

Shelbyville, Ill.—J. C. Westvelt has been appointed receiver of the electric light plant owned by Trout Bros. & Co. Their liabilities are put at \$9,000, assets at \$12,000.

South Bend, Ind.—Negotiations have been concluded with Pittsburg parties for the purchase of the two car lines in this city. A large sum is to be spent in rehabilitating and extending the systems.

St. Louis.—The North & South Railroad ordinance has passed both the House of Delegates and city council. The bill provides for a 50-year franchise to operate 100 miles of streets in St. Louis, and the lines are permitted to cross and recross the tracks of other street railways and to use their tracks when it is convenient. The vote was 8 to 5 in the council. John H. Blessing is president of the company.—The Board of Public Improvements has sent to the council three bills for city lighting after 1900. One provides for lighting by gas for five years, the city to be divided into six districts. One provides for the lighting by electricity for five years. The third provides for a fifteen-year electric contract. Both of the electric ordinances divide the city into two districts, north and south of Washington ave. The estimate of cost under each ordinance is \$400,000 a year, the amount estimated to be available. Bonds for \$250,000 are required on each bid.

Trenton, N. J.—A bill introduced in the House by Mr. Squier authorizes counties to sell to the highest bidder franchises for trolley roads, the money to be used to improve public roads.

Warren, O.—The American Electric Company's factory will soon be in full operation. This is a new industry in Warren and will furnish employment to over 100 people.

Walla Walla, Wash.—Proposals for electrically lighting streets will be received at the office of the city clerk until March 1. Number of lights from 50 to 100 of 1,200 minimum candle power. Bids to be for three and for five years. Contract to date from November 1, 1898.

Webster, Mass.—The board of selectmen has voted to grant a 50-year franchise to the Webster & Dudley Electric Railway Company, and the company will build an electric road from Perryville in Dudley through streets of Webster to Webster lake.

West Hampton, N. Y.—Word has reached here that the State Railroad Commission has denied the application of the Riverhead, Quogue & Southampton Railroad Company for permission to construct a trolley road between Riverhead and this place, to terminate at the ocean. The application was opposed by the Long Island Railroad Company, on the ground that the company intended to parallel its lines.

White Plains, N. Y.—It is the intention of the Port Chester Electric Railroad Company to extend its line from the northwest terminus in Westchester avenue to the town line of Harrison, at Blind Brook, and thence to this village, through Railroad avenue, to the New

York and Harlem Railroad station. This will connect the latter road with Rye Beach, a favorite summer resort on Long Island Sound.

NOTES FROM A CORRESPONDENT.

Albany, N. Y.—The Senate Committee on Railroads has reported favorably the bill of Senator Wilcox amending the railroad laws so as to provide that an electric railway company may become the owner of a lighting system.

Rensselaer, N. Y.—The common council has given the Kinderhook Light & Power Company until March 3 to complete its arrangements for lighting the city. All the material for the Kinderhook Company has arrived. The contract for setting the poles and stringing the wires has been awarded to J. J. Bergen of Troy.

Saratoga, N. Y.—It is reported that the electric road from Saratoga to South Glens Falls, which has been talked of for a long time, is now to be an accomplished fact. New York capitalists have, it is said, agreed to take the bonds, and the money necessary will be forthcoming.

Schenectady, N. Y.—Edward Clark, auditor of the General Electric Company, who recently went South for the benefit of his health, has returned to his home.

PERSONAL AND MISCELLANEA.

Dr. Von Welsbach, inventor of the incandescent gas-burner now very much in vogue, has recently taken out patents on an electric lamp working on a similar plan. He is an Austrian chemist.

The Cincinnati "Enquirer" states that while John W. Baughman, of Williston, Ohio, was in Cincinnati, a few days ago, "he exhibited his latest invention in electricity, that is, the art of using telegraph instruments and electric bells without the use of any batteries whatever." The "Enquirer" says Mr. Baughman uses the earth for battery and expects to be able to light up houses with his new invention as it has been also tested on miniature lamps.

California is well known as the land of flowers, and when the flower fetes take the form of trolley parties they are gorgeous in the extreme and the cars are bedecked with a profusion and elegance that surprise the Eastern visitor. Recently the young ladies in San Jose took charge of a number of street cars on the San Jose & Santa Clara electric line, decorated them with flowers and ran them for the entire day. The motive, of course, was charity, and the sum netted was \$350.

Prof. Elisha Gray, the noted electrician and inventor, who was reported to be dangerously ill at Chicago, has informed his friends that there was some mistake, as he is in good health and not in any danger of dying. His daughter has been seriously ill, and the professor thinks the names have become confused.

James R. Taylor, who died at his home in Brooklyn, N. Y., on the 10th inst., was one of the pioneers in electrical engineering in New York. He was 62 years old.

RECENT COMPANY ELECTIONS.

Albert Lea Electric Company, Albert Lea, Minn.—President, George L. Carrington; secretary, S. H. Cady; treasurer, Harry Jones; directors: G. C. Edwards, Bridgeport, Conn.; S. H. Cady, W. E. Todd, George L. Carrington, Harry Jones, Albert Lea.

Beaver Valley Traction Company, Beaver, Pa.—Directors: John M. Buchanan, John T. Taylor, Dr. Theodore P. Simpson, Robert S. Kennedy, Dr. H. McConnel, John P. Sherwood and Albert M. Kolly.

Chicago Electric Traction Company, Chicago.—President, Jules S. Bache; vice-president, Samuel R. Shipley; treasurer, Henry Lewis; secretary, H. A. Hinsley. The Englewood & Chicago Electric Street Railroad has ceased to exist, the title being transferred to the Chicago Electric Traction Company.

Cumberland Electric Light & Power Company, Nashville, Tenn.—President, T. M. Steger; vice-president, Frederick S. Pratt; secretary and treasurer, Thomas Taylor; general manager, L. J. Webster; directors: T. M. Steger, Frederick S. Pratt, L. J. Webster, C. F. Steirly and Thomas Taylor.

Hagerstown Street Railway Company, Hagerstown, Md.—President, C. W. Lynch; treasurer, William Jennings; secretary, William Hepperle; directors: Christian W. Lynch, William Jennings, Harry Jennings, J. C. Lane, J. G. Bitner, W. C. Hepperle and Martin Hayley.

Hartford Electric Light Company, Hartford, Conn.—President, A. C. Dunham; vice-president, E. B. Bennett; treasurer, D. N. Barney; secretary, D. P. Colton; auditor, George H. Gilman; directors: C. Dunham, Wm. H. Bulkeley, W. G. Burr, Atwood Collins, E. B. Bennett, Henry Roberts, Rodney Dennis, D. N. Barney, E. K. Root, Lucius P. Robinson, W. L. Robb, W. F. Henney.

Lancaster Electric Light, Heat & Power Company, Lancaster, Pa.—President, W. F. Beyer; secretary, George B. Wilson; treasurer, R. H. Brubaker. This company, just organized, has the contract for lighting the streets of Lancaster for five years.

Pittsburg & Suburban Electric Railway Company, Pittsburg, Kan.—President, Morris Cliggett; superintendent, L. G. Gibson; secretary and treasurer, M. O. Dickey.

Rising Sun, Northeast & Elk Neck Electric Railway Company, Elkton, Md.—President, James Mullen; secretary and treasurer, George W. Cosden; manager, L. O. Cameron; directors: James Mullen, George W. Cosden, M. E. Kirk, E. E. Duyekineck, J. M. C. Carhart, Andrew Anderson, L. O. Cameron, Dr. Frank Mackie and William L. Mearns.

Star Electric Company, Binghamton, N. Y.—President

George S. Beach; secretary and general manager, C. E. Beach; treasurer, H. W. Doughty; directors: George S. Beach (to hold office until the first Tuesday in May, 1901), C. E. Beach (ditto 1900), W. H. Doughty (ditto 1899), S. H. Chase (ditto 1898).

Suburban Electric Company, Elizabeth, N. J.—President, A. M. Young; vice-president, Henry Hayes; secretary, A. B. Carlton; treasurer and general manager, E. H. Stevens; directors: A. M. Young, Hon. F. M. Voorhees, Henry Hayes, A. B. Carlton, B. G. Bryan and M. P. Clough.

Wilmington City Railway Company (under the reorganization), Wilmington, Del.—President, Clarence M. Clark; vice-president, E. J. Moore; secretary and treasurer, Thomas S. Beiloh; general manager, Robert F. Fox; directors: C. M. Clark, E. J. Moore, C. Ford Stephens, Thomas C. Barr of Newark, N. J., Preston Lea, E. W. Clark, Jr., William W. Pusey.

COMMERCIAL PARAGRAPHS.

De Veau & Co., the well-known manufacturers of high-grade telephone apparatus, have recently moved to 27 Rose street, into more spacious and comfortable quarters. The high character of the goods this concern has the reputation of turning out is too well known to require a lengthy description. Their special long-distance telephones, with adjustable arm coal grain ball transmitter, are now extensively used by many independent exchanges throughout the country. The prices of these 'phones range

DEVEAU LONG DISTANCE TELEPHONES.

from \$16 to \$23, depending on the style of generator, which, considering how satisfactory they invariably prove both in construction and operation, are extremely reasonable. This, however, is but one of the numerous apparatuses this company carries, and almost any design of telephone,

THE "B. H. G." SWITCHBOARD DROP.

either transmitter or receiver, can be obtained by addressing the De Veau Company. Besides telephones, a large and choice assortment of special tools, insulators, batteries, electric bells and line material are always on hand ready to be shipped at a moment's notice. We would strongly advise any independent company who either contemplate equipping an exchange or desire to increase the number of their 'phones in use to address De Veau & Co., 27 Rose street, New York.

We are in receipt of an attractive catalogue of some thirty pages lately gotten out by the Ward Leonard Electric Company of Bronxville, N. Y., exclusively devoted to describing various new types of outlet boxes. This well-known company manufactures outlet boxes of every variety, but have made a specialty of porcelain-lined outlet

boxes, which have become a standard for the best practice in electric wiring work in New York City, and are rapidly becoming so in other large cities. The fact that 81,000 of these boxes were installed during 1897 in New York City alone goes to show how highly this type of box is thought of. The catalogue referred to is fully illustrated, and any persons contemplating equipping a building with outlet boxes would do well to address the Ward Leonard Electric Company, for considering the quality of their product their prices are extremely reasonable.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

Business Changes.

The Bissell, Dodge & Erner Co. has for three years maintained a branch office at Columbus, O., where the business has assumed proportions that make it desirable to run it as a separate concern. To do this Mr. John A. Erner has sold his interests in Toledo and purchased the Columbus business entire. Little change will be made in either place except the names, which will be F. Bissell & Co., Toledo, and J. A. Erner & Co., Columbus. The affairs of the Bissell, Dodge & Erner Co. will be closed up at the Toledo office.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

Mechanical tell tales for water-tanks, as is well known, have several serious objections, especially if the tank is situated at some distance from the pump. With a view to remedying these defects, Gustave S. Neu, of 147 Centre street, New York, brought out some time ago what is known as Neu's Electrical Tell-Tale Floats, which were especially designed to overcome all the objections that have heretofore presented themselves in devices of this description. The apparatus is simplicity itself and consists in an electrical connection on a tank or reservoir to sound an alarm when the contents are either too high or too low. These floats have many points of superiority, namely, the ease with which they can be put up and the fact of their not rusting or corroding; they can, moreover, be put up for very little money. How well Neu's Tell-Tale Floats answer all requirements is amply proven by their service for the last five years, as well as by the fact that they are extensively used by several automatic sprinkler companies.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

INCORPORATIONS.

The Winsboro Electric Light & Power Company, Winsboro, Wood County, Texas. Capital stock, \$3,000. Incorporators: R. G. Andrews, C. H. Morris, W. T. Whiteman and Manton Jones.

The Triumph Light, Heat & Power Company, Camden, N. J. Capital stock, \$200,000. Incorporators: George A. Banks, R. Linwood Martin, Robert B. Kee and James W. Moore, of Philadelphia, and Alfred J. Lucas, of Gibbsboro, N. J.

The New England Electric Railroad Construction Company, Worcester, Mass. Capital stock, \$25,000. President, E. E. Carpenter; treasurer, H. F. Leland.

The San Angelo Ice & Power Company, San Angelo, Tex.—to sell ice and to manufacture and supply electric light, heat and power. Capital stock, \$30,000. Incorporators: George Bond, George E. Webb, C. H. Powell and others.

The Madison Street Railway Company, Madison, Wis. Capital stock, \$75,000. The filing of the articles presages a reorganization of the company.

The People's Electric Light, Heat & Power Company, Ocean City, N. J. Capital stock, \$50,000. Incorporators: George Pfeiffer, Jr., George Barrett, J. Rufus Eastlack, of Camden, and others.

The Atlas Syndicate Company, Jersey City, N. J.—to survey, build and complete railroads, water, gas or electric works, etc. Capital stock, \$100,000, of which \$1,000 has been paid in. Incorporators: Charles H. Hall of Jersey City and Henry L. Olden and August Graf of New York.

The Atlanta Water Power Company, Atlanta, Ga.—to supply electric power for running electric railways, elec-

TELEPHONE AND TELEGRAPH.

tric light plants and the like for cities and other corporations. Capital stock, \$10,000. Incorporators: Henry B. Wilson, R. H. Smith and O. Elmer Smith.

The Westchester Gas & Electric Company, White Plains, N. Y.—to carry on the manufacture of gas and electric light in the towns and villages of Ely, Port Chester, Mamaroneck, Larchmont, New Rochelle, Harrison and Scarsdale, N. Y., and Greenwich, Conn. Capital stock, \$300,000. Directors: James M. Pendleton of Westbury, R. I., George V. Foster of New York, Arthur L. Chester of Westbury, R. I., Wallace Hackett of Portsmouth, N. H., Herbert T. Jennings of Mount Vernon, N. Y., Paul Armitage of Bay Shore, N. Y., and Henry D. Donnelly of Brooklyn, N. Y.

The Rocky Mount Ice Company, Rocky Mount, N. C.—to construct and maintain cold storage and electric light plants. Capital stock, \$18,000. Incorporators: W. E. Parish and others.

The Empire Light & Power Company of Quincy Ill., has certified to an increase in capital stock from \$60,000 to \$100,000.

Articles of association have been filed for the New Bedford, Middleboro and Brockton (Mass.) Street Railway. Plans include the building of 3½ miles of track to extend from the Marine Park in New Bedford, through Acushnet, Freetown, Lakeville, Middleboro and North Middleboro, to connect at Bridgewater Center with the Brockton, Bridgewater & Taunton Railroad. Capital stock, \$325,000.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 15, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 598,937. Trolley. Charles H. Johnson, Elmhurst, Cal. Filed Oct. 24, 1896.
- 598,947. Track Pond for Electric Railways. Frank T. Mather, Detroit, Mich., assignor of one-half to Alexander S. Tolsma, same place. Filed June 29, 1896. Renewed Dec. 24, 1897.
- 599,081. Insulated Joint for Railroad-Rails. Thomas O'Brien, Jr., Philadelphia, Pa. Filed June 4, 1897.
- 599,162. Electric System of Propulsion. William M. Brown, Johnstown, Pa., assignor to the Johnson Company, Lorain, Ohio. Filed May 18, 1897.
- 599,274. Trolley-Pole for Overhead Electric Railways. J. L. Walker, Louisville, Ky. Filed June 18, 1897.
- 599,307. Trolley-Actuated Switch-Operating Device for Electric Railways. Louis E. Walking, Springfield, Mass., assignor of one-half to Frank W. Dickinson, same place. Filed Aug. 18, 1897.
- 599,281. Fender for Street-Cars. Henry W. Bodeman, San Francisco, Cal., assignor of one-half to M. H. Logan, same place. Filed April 21, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 598,942. Electric-Arc Lamp. George R. Lean, Cleveland, O.; Jotham Potter, administrator of said Lean, deceased, assignor to the Jandus Electric Company, same place. Filed Feb. 20, 1897.
- 599,002. Incandescent Lamp. John T. Lister, Cleveland, O. Filed Oct. 14, 1896. Renewed Jan. 17, 1898.
- 599,052. Electric-Arc Lamp. Charles N. Black, New Haven, Conn., assignor to the Walker Company, Cleveland, O. Filed April 20, 1897.
- 599,121. Electric Gas-Lighting Apparatus. William E. Cram and James H. L. Clegg, Boston, Mass.; said Clegg assignor to said Cram. Filed April 30, 1897.
- 599,305. Electric-Arc Lamp. Christian Tepel, Bennett, Pa., assignor to the Aurora Arc Lamp Manufacturing Company of Pennsylvania. Filed March 10, 1897.
- 579,306. Making Filaments for Electric Lighting. Detlef C. Voss, Boston, Mass. Filed Aug. 3, 1891.

ELECTRICAL MACHINERY AND APPARATUS.

- 598,905. Apparatus for Electrically Measuring Temperatures. Hugh L. Calendar, Montreal, Canada. Filed July 31, 1896.
- 598,922. Automatic Cut-Out for Electrical Converters. William J. Greene, Cedar Rapids, Iowa. Filed Jan. 18, 1896. Renewed May 21, 1897.
- 598,916. Direct-Acting Oscillating Electric Motor. James H. Mason, Brooklyn, N. Y., assignor to John W. Morrison and W. W. Lounsbury, same place. Filed March 24, 1897.
- 598,991. Controller for Electric Motors. Ernst W. G. C. Hoffmann, Charlottenburg, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Dec. 29, 1897.
- 599,016. Electric Meter. Carl Raab, Kaiserslautern, Germany. Filed Feb. 27, 1896.
- 599,094. Transforming Potential Energy of Carbon into Electrical Energy. Henry Blumenberg, Jr., New York City. Filed April 7, 1896.
- 599,186. Electric Controller. Frank A. Merrick, Auburn-dale, Mass., assignor to the Steel Motor Company, Johnstown, Pa. Filed May 27, 1897.
- 599,220. Electric Alarm Water-Column. Martin L. Bush, Lawrence, Mass., assignor of one-half to Charles F. Swain, Methuen, Mass. Filed June 14, 1897.
- 599,302. Direct-Current Meter. Gustave A. Scheffer, Peoria, Ill., assignor to the Diamond Electric Company, same place. Filed May 7, 1896.

ELECTRIC ELEVATORS.

- 599,015. Electric Elevator. Harold Rowntree, Chicago, Ill., assignor to the Burdett-Rowntree Manufacturing Company, same place. Filed Feb. 28, 1896.

MISCELLANEOUS.

- 598,940. Fusible Cut-Out. James Jones Jr., Brooklyn, N. Y. Filed March 12, 1897.
- 598,918. Electric Battery for Medical Purposes. Carl W. Moessner, Philadelphia, Pa. Filed June 2, 1896.
- 598,972. Tip for Electric Conductors. Alden B. Blodgett, Lowell, Mass., assignor to Charles H. McEvoy, same place. Filed Dec. 22, 1896.
- 599,292. Underground Conduit for Electric Wires. Adelbert L. Daniels, North East, Pa., assignor to the H. B. Camp Company, Aultman, O. Filed Dec. 22, 1897.
- 599,304. Demagnetizing Device. Harry A. Storrs, Burlington, Vt., assignor to the Draper Company, Portland, Me., and Hopedale, Mass. Filed June 18, 1897.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

A Possible Rival of the Bell Company.

The Union Telephone Company, organized at Portland, Me., has filed incorporation papers in that city. The capital stock is \$10,000,000 and the par value of shares \$100. The purposes of the company as set forth in the papers filed are to manufacture, buy, lease and otherwise acquire and dispose of telephones, switchboards and electrical apparatus; also, to acquire, hold and dispose of real-estate, machinery and parts thereof, patterns, patents, inventions, licenses under patents and inventions; to acquire, hold and dispose of the capital stock, bonds and other securities of other corporations, and issue its own bonds and preferred stock. Subscribers to the papers who have paid in the first \$300 are George N. Morton and Frederick H. Gorman of New York, and George A. Beaton of Detroit, Mich. The directors named in the papers are Frederick H. Gorman, George A. Beaton and George N. Morton; president, Frederick H. Gorman; treasurer, George A. Beaton; clerk, Franklin C. Payson of Portland.

A press dispatch from Detroit says: "Hidden behind the Union Telephone Company, organized in Portland, Me., is said to be a promotion company which will have headquarters in New York City and will secure franchises in the Eastern States. Filing of incorporation papers in Portland was said to be merely an evasion of the harsh laws of New York. The fight against the Bell Telephone Company, which gained impetus through the organization of the Detroit Telephone Company last year and consequent competition all over Michigan, will probably be pushed more vigorously by Eastern capital. It is probable that the newly organized promotion company will begin work in New York City at once. Officers of the Detroit company are interested in the proposed New York exchange. George A. Beaton, treasurer of the Eastern company, was formerly secretary to ex-Governor Foraker of Ohio, and is a well-known Ohio politician. He was the promoter of the Detroit Telephone Company, and established several big exchanges in Michigan. As far as possible, it is said, the Union Telephone Company will place the apparatus manufactured by the Detroit Switchboard and Telephone Company in the Eastern exchanges. William L. Holmes, president of the Detroit Company, says the new concern is only a forerunner of a movement more gigantic than anything yet anticipated in this line."

The Central New York Telephone & Telegraph Company re-elected its old officers and directors at the annual meeting. The treasurer's report showed that the gross revenue for the year was \$219,593.77; expenses, \$177,927.84; net revenue, \$41,665.93. Compared with 1896 there was an increase of gross revenue of \$9,328.81, an increase of gross expenses of \$15,270.49, a decrease of net revenue of \$5,941.68. The total number of exchange subscribers is 3,626, a gain of 308 during the year. Dividends were paid during the year to the amount of \$30,000, being at the rate of 6 per cent. on the capital stock.

Edward B. Elliott, chief of the new Electrical Department in Chicago, has, under instructions from Mayor Harrison, notified telegraph, telephone and all other companies using wire communication in the business districts of that city that they must take steps before the 1st of March to bury their wires, otherwise poles will be cut down by the city authorities.

Mr. Wicke has introduced a bill in the Assembly at Albany which provides that in any city of the first class telephone companies shall not charge more than 10 cents for a single message for five minutes and not more than 5 cents for each additional five minutes. The bill is intended evidently to prevent extra charges for telephoning to the annexed portions of the Greater New York.

A new telephone company has been organized at Marietta, Ga., and a charter has been applied for. The city has already granted all the rights asked for. The men named in connection with the enterprise are O. Rex and E. W. Coleman of North Manchester, Ind.; J. L. Clark of Marysville, Tenn.; Col. L. N. Trammell, Walter Sessions, J. N. Gantt and others of Marietta. The name adopted is the Marietta Telephone Company, and the Stromberg-Carlson system will be used.

A card signed by a long list of real-estate dealers and agents, recommending the Kinloch Telephone Company's projected service in St. Louis to the favor of the public, has been published in the local papers. The Kinloch Company's charges range from \$36 to \$60 per annum, and they guarantee as good service as the Bell Company, whose charges are much higher.

The Interstate Telephone Company has asked for a franchise to establish an exchange in Salem, Va. The Bell Company has already an exchange in Salem and a rate war is looked for.

A bill has been introduced in the Virginia Legislature to incorporate the Richmond, Petersburg and Southside Tel-

ephone & Telegraph Company, to operate a telephone line between Richmond and Petersburg, Va. Among the incorporators are W. B. McIlwaine, A. Rosenstock and T. F. Heath.

Owing to the Judge's decision in the Fredonia Hotel case at Washington, denying the guests at hotels the right to use the hotel telephones, four hotels in that city have ordered the Bell Company to take out its telephones. It is thought a general boycott of the company will be organized.

The Cumberland Telephone & Telegraph Company, which has just absorbed the Great Southern Telephone Company, will continue to make Nashville, Tenn., its headquarters. The property brought under the Cumberland Company's control by the deal is valued at \$1,500,000.

The Virginia House has passed a bill incorporating the Atlantic Telephone Company. Governor Tyler has approved the bill incorporating the Grayson Telephone Exchange.

According to recent published statements, since 1880 the American Bell Telephone Company has expended \$2,348,435 in litigation. It costs something to uphold a monopoly and the patrons have to pay it all. The rates are kept up to the requirements of the dividends.

The Central Electric Company of Painesville, O., recently incorporated with a capital stock of \$10,000, will construct and operate telephone lines connecting eastern Ohio cities with Cleveland. The incorporators are: E. L. House, G. C. Steele, C. F. House, E. S. Gravel and E. J. House.

The Austin (Minn.) Telephone Exchange, with all its connections, has been sold to the Northwestern Telephone Exchange Company which already controls the other connections at Austin.

The city council of Columbus, Neb., has granted to the Central Telephone & Electrical Company a franchise to construct and operate a telephone exchange in Columbus. The same company intends to put in exchanges at Fullerton and Albion, Neb.

A Dover, Del., dispatch states that the Diamond State Telephone Company will extend its line to Lewes through Milton.

New Companies Incorporated.

The Farmers' Telephone Company, Perrysville, O. Capital stock, \$3,000.

The Interstate Telephone Company, Ortonville, Minn. Capital stock, \$5,000. Incorporators: A. W. Randall, Peter Bertelson, Fred M. Green, C. W. Schneider, I. O. G. Wall, F. W. Sanborn, C. W. Harrington, E. N. Morrill of Ortonville; John Gold, F. R. Moore and T. E. Forsyth of Big Stone City.

The Mountain Telephone Company, Farlan, Ky.—to establish a telephone system. President, H. Clay; secretary and treasurer, Prof. W. C. Clemens; general manager, John B. Hurst.

The Newport News Mutual Telephone Company, Newport News, Va.—to establish a telephone system. Capital stock, \$10,000. President, M. B. Crowell; secretary, N. O. Watts; treasurer, Isaac Witz.

The Chester County Telegraph & Telephone Company, Oaks, Montgomery County, Pa.—to run lines in Chester, Montgomery, Bucks, Lancaster and Delaware Counties, Pa. Capital stock, \$30,000. Incorporators: Samuel W. Gumbes, Samuel W. Gumbes, Jr., Frank M. Gumbes of Oaks, and Thomas L. Hodge and William D. Barnard of Philadelphia.

Jackson Telephone Company, Cape Girardeau, Mo.—Capital stock, \$2,500. Incorporators: Samuel Hitt, Leo Hart, J. N. Miller and others.

The Ogle County Telephone Company, Rochester, Ill. Capital stock, \$5,000. Incorporators: F. W. Hamlin, John Delancy and A. W. Guest.

The Telephone Construction Company, Jersey City, N. J. Capital stock, \$100,000. Incorporators: George W. Wentz, Spencer Weart and William L. Reer of Jersey City.

The Western New York Telephone Company, Buffalo, N. Y.—to operate a telephone system in Buffalo and in the cities and villages in the counties of Erie, Niagara, Orleans, Genesee, Cattaraugus and Chautauque. Capital stock, \$500,000. Directors: Edward Michael, Henry Koons, Alonzo R. James, Tracy C. Becker, L. F. Wesser, Isadore Michael, W. S. Grattan, Buffalo; E. F. Rankine, S. J. Lawrence, Niagara Falls. The company will probably use the automatic system.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 10 1/2 @ 10 3/4 c.; Lake, 10 1/2 @ 11 c.; casting, 10 1/2 @ 11 c.

Interest upon the scrip of the Westinghouse Electric & Manufacturing Company to March 1 will be paid to holders of record on that date.

The Third Avenue Railroad Company, New York, has declared a quarterly dividend of 2 per cent., payable February 28. Books will reopen March 1.

The net earnings of the Edison Electric Illuminating Company of New York for the month of January were \$298,307 as against \$240,299 in January, 1897.

Senator Wilcox's bill, amending the laws in relation to the powers of electric light and power corporations by allowing extensions beyond city limits was passed in the New York Senate on the 17th inst.

The Syracuse (N. Y.) Rapid Transit Railway Company offers through E. C. Jones Company and Townsend, Whelen & Co., a new issue of \$1,250,000 first mortgage 5 per cent. fifty-year gold bonds at 101 and interest.

In the suit of Carrie E. Read against the Brooklyn Heights Railroad Company, Brooklyn, N. Y., for the loss of her husband, John J. Read, killed in a trolley accident, the jury has brought in a verdict of \$25,000, the largest in a death case ever recorded in Brooklyn.

The Edison Electric Illuminating Company of New York has voted to increase its capital stock by 15 per cent., offering the additional amount to present stockholders at par. Payment is required in three equal installments—on March 10, May 2 and August 2. The new stock does not carry interest or dividends until fully paid.

The Detroit Telephone Company has put on the market \$100,000 worth of 25-year gold bonds, bearing interest at 6 per cent. The mortgage on the franchise, conduits and apparatus of the Detroit Telephone Company, which secures the bonds, authorizes the sale of \$600,000 worth of bonds on a plant of 5,000 telephones. The Central Trust Company of New York is trustee.

Mr. Lauterbach, counsel of the Third Avenue Railroad, New York, states emphatically that there is no foundation for the rumor that a working arrangement between the Metropolitan Street Railway Company and the Third Avenue Company was in contemplation. He says: "Such a project has never been suggested or considered, and there is not the slightest shadow of probability that it ever will be."

An order of sale has been made by United States Circuit Judge William H. Taft at Cincinnati to dispose of the property owned by the Cincinnati Inclined Plane Railway Company, known as the Main Street Electric line. The sale is ordered on a petition in foreclosure made by the Louisville Trust Company. Mr. Philip B. Spence of Newport, Ky., has been appointed special master commissioner to make the sale.

The issue of \$2,000,000 of Chicago Passenger Consolidated 5 per cent. bonds has been listed on the Chicago Stock Exchange. The bonds were issued some months ago for the purpose of refunding old 6 per cents and paying off the floating indebtedness of the Chicago Passenger to the West Chicago Street Railroad. The Passenger Company by means of the issue was enabled to fund all its outstanding floating obligations.

The semi-annual statement of the United Electric Securities Company, Boston, for the six months ended February 1, 1898, is issued. Of the \$8,000,000 collateral trust 5s sold \$1,207,000 have been retired and cancelled from the proceeds of the sale of \$4,631,500 of underlying bonds pledged as security therefor. The price at which the collateral 5s have been redeemed is about 3.213 per cent. over the subscription price. The sales of the underlying bonds have been made at an average price of about 87.63.

The Knickerbocker Telephone & Telegraph Company has been incorporated with a capital of \$7,500,000 to construct and operate lines of telephone from New York City throughout New York State and New Jersey. The directors are Samuel B. Lawrence, Francis P. Lowery and Charles L. Horton of Manhattan Borough (New York), and John B. Summerfield, Henry M. Haviland, George E. Spencer and Henry E. Everdell of Brooklyn Borough. The company paid into the State Treasury at Albany an organization tax of \$9,375.

A trust deed has been filed in the register's office at Knoxville, Tenn., by the Knoxville Electric Light & Power Company to the Union Trust Company of Philadelphia, authorizing an issue of \$100,000 of bonds that will bear interest at the rate of 5 per cent., the principal and interest being payable in gold. The instrument states that \$50,000 of the issue shall be used in the payment of outstanding bonds of the company. Further, that \$50,000 shall be used in the payment of the issue of bonds of the Schuyler Electric Light & Power Company.

The personal property of the Home Telephone Company was sold at sheriff's sale at Pittsburg, Pa., on the 17th inst., to C. E. Phelps & Co., of Baltimore, for use of Martin Meyerdeick, for \$100. Phelps & Co. issued an execution against the company in December for \$16,190.03. The assets of the company consisted of the poles it had erected and the conduits that were placed in the streets, and the office furniture of the company. The company had expended over \$70,000 in Pittsburg to supply cheap telephones.

A bill has been introduced in the New York Assembly incorporating Eugene Treadwell, Nathan Ottinger, Herman J. Katz, B. Franklin de Freece and Edgar M. Johnson as the New York Water & Electric Power Company, with principal office in New York City. The capital is fixed at \$100,000, with privilege to increase it to \$25,000,000. The purposes of the corporation will be the storage, transmission, sale and use of water for the generation of hydraulic power and other forms of force and energy capable of being derived therefrom, especially electricity, and for the purposes of manufacturing, mining or agriculture, and the transmission, supply, distribution and sale of such power or powers to the various civil divisions of the State for commercial, manufacturing, propelling, navigating and other purposes.

Formal announcement was made on the 15th inst. that a controlling interest in the stock of all the independent electric light companies of Philadelphia had been acquired by the Pennsylvania Manufacturing Light & Power Company, incorporated under the laws of New Jersey, with a capital of \$15,000,000. The announcement was made by Martin Maloney, president of the Pennsylvania Heat, Light & Power Company, which absorbed the local Edison company through the medium of a collateral trust two years ago. The new company will issue \$15,000,000 collateral 5 per cent. gold bonds in exchange for the stock of the minor companies. No organization of the new \$15,000,000 enterprise has been effected yet, but Martin Maloney will undoubtedly be made president.

The Massachusetts Railroad Commissioners' report, issued last week, contains the annual reports of 93 street railways for the year ending September 30, 1897. The aggregate gross receipts of these roads were \$15,898,839; operating expenses, \$10,904,040; net, \$4,994,799; charges, \$2,401,652; balance, \$2,593,147; dividends, \$1,965,243; surplus, \$627,904. The figures for the same period in 1896 were: Gross receipts, \$14,900,942; operating expenses, \$10,563,371; net, \$4,337,571; charges, \$2,056,795; balance, \$2,280,776; dividends, \$1,802,847; surplus, \$477,929. The gross assets of the companies in 1897 were \$67,509,916; gross liabilities, \$66,483,414; surplus, \$1,026,502. The Commissioners' report includes the reports of ten more roads than were in operation in 1896. Main track constructed during the year amounted to 137 miles, making a total of 1,517 miles, of which only 12 miles are operated by horses. The total number of passengers carried is 308,654,224, an increase of 16,325,281.

ELECTRICITY.

EDITORIAL NOTES.

Submarine Mines and Electricity.

Electricity as a means of controlling the engines of war plays an important part. This is especially the case with submarine mines

and torpedoes which are kept under thorough control and made to act at the proper time through the influence of the electric current. Submarine mines have been extensively used in modern warfare, notably during the civil war in this country and during the Franco-Prussian conflict. The last decade, however, has seen extensive improvements in the method of firing mines due to the rapid development of electricity.

Probably the simplest form of mine, and the one most extensively used until electricity came into general use, was that known as the contact mine, which consisted of an iron case containing an explosive attached to a cable, the latter having its lower extremity fastened to an anchor of some sort. The iron case was provided with a number of firing pins, any one of which being brought in contact with the hull of a ship fired a percussion cap and exploded the charge. As will readily be seen, these contact mines are not in any way under control, and were equally dangerous to friend and foe. With a view to remedying this evil, what is known as the electro-contact mine was invented. In this device the firing pins on the case containing the explosive, instead of exploding a percussion cap when brought in contact with an object, act as a switch by closing one opening in an electric circuit. Another switch is located in this same circuit at a station on shore, so that in order to fire the mine it is necessary to close the land switch at the same time that one of the pins has been driven in by the hull of a vessel. If this is not done no explosion takes place, which enables friendly vessels to pass in and out without fear of accidentally running foul of a mine and being blown up, as would be the case with the ordinary form of contact mine.

Numerous electrical inventions have been patented from time to time for controlling and firing submarine mines. One of these inventions consists in an ingenious arrangement for holding a mine down near the bed of a bay or other body of water, to enable friendly vessels to pass over it in safety. The device consists in a loop fastened to the anchor and to a point on the cable near the mine. In a hollow opening in this loop a small charge of an explosive is placed which can be fired from the shore by means of a spark from an electric battery. In bursting, the loop is destroyed and the mine immediately rises the full length of its cable and to within a few feet of the surface. The mine itself may then be fired from the shore in the ordinary manner.

In deep water, or where a strong current exists,

recourse is had to what is known as ground mines. These consist of large charges of gun cotton or other high explosive held in or near the ground by means of mushroom anchors. Mines of this character being too far below the surface to be fired by coming in contact with the hulls of vessels, arrangement has to be made to ascertain exactly when a vessel is over a mine in order to know when to fire it. This is accomplished by a very simple method, although an extremely ingenious one. An electric circuit extends from the mine to two stations on land at no great distance from one another. At each of these stations a break occurs in the electric circuit, and in order to explode the mine both of these breaks must be closed simultaneously. A telescope is mounted at each station on a pivot, which permits of its being swung in a horizontal direction, and so arranged that when pointed at the mine it closes the circuit at that station. Thus all that is necessary to do is to keep both telescopes pointed at an enemy's vessel as it advances, and when the latter passes over the mine both switches will be closed, the circuit completed and the mine exploded.

Innumerable other devices have been brought out, in which electricity invariably plays an important part, for carrying on warfare of this nature. What is known as the observation mine, an improvement over the electro-contact mine, is one of these. In a mine of this character the firing mechanism and the explosive are in two distinct and separate receptacles, placed one above the other on a cable. The contact buoy which contains the firing pins floats a few feet below the surface of the water, the mine itself being located several feet below it. With mines of this description there are always two separate and distinct electrical circuits leading to the shore. One is known as the firing circuit, while the other, in circuit with the firing pins on the upper receptacle, rings a bell at the shore station whenever one of the pins is driven in by coming in contact with an object. Mines of this description are usually placed in groups, all the wires being brought together at a switchboard at the firing station. An operator stands ready at hand, and as soon as a bell rings the switch corresponding to that bell is closed and the mine exploded.

The advantage of the observation mine is that, contrary to what its name implies, no observations have to be taken to locate the position of an enemy. The operator, in a bombproof chamber underground, simply watches the switchboard and awaits a signal.

It is the aim and ambition of inventors to devise some means of exploding a torpedo charge or a mine at a considerable distance by electricity without any intermediate connection such as wires. Possibly an arrangement of this nature will be forthcoming in the future, worked on somewhat the same principle as Marconi's wireless telegraphy, by means of Hertzian waves.

The Diesel Motor.

We are living now in what might justly be termed an age of progress. During the last half century many important and valuable inventions have appeared and most of the machinery and apparatus then in use has since been developed and brought to a high state of efficiency. Probably the machine that has been least affected by the onward march of progress is the steam engine. This prime mover is now practically in the same comparatively crude state that it was fifty years ago, if we except possibly a few minor improvements tending to make the machine more compact and to facilitate the cleaning and oiling. As far as the efficiency is concerned, it still leaves much to be desired, the modern stationary steam engine wasting, as is well known, in the neighborhood of 87 per cent. of the energy in the coal. One cannot help but be forcibly impressed with the difference between an efficiency of 13 per cent. in the steam engine and the high efficiency of 96 to 97 per cent. in electrical machines that manufacturers of the latter are willing to guarantee.

At the present time there is said to be a prime mover under construction in St. Louis that will show a marked improvement as far as efficiency is concerned over our present stationary steam engines. This motor was perfected a short time ago by Mr. Diesel in Germany and is now being manufactured under patents granted to the inventor. From numerous tests that have been made it is claimed that the Diesel motor has an efficiency of from 25 to 30 per cent., or more than twice the efficiency of our steam engines. The fuel used is petroleum, of a low grade of lamp oil, the amount consumed varying from .48 pound to .55 pound per horse power. The process for converting the heat energy of the fuel into work consists in compressing air to a degree producing a temperature above the igniting point of the fuel which is to be consumed, then gradually allowing the fuel for combustion to mix with the compressed air while expanding against a resistance sufficient to prevent an essential increase of temperature and pressure, then shutting off the supply of fuel and allowing further expansion to take place without transfer of heat.

In the Diesel motor cylinder condensation is reduced to a minimum or entirely avoided by using only permanent gases as the vehicle of the expansive force of heat. There is naturally less loss of heat to the cylinder walls, owing to the fact that the gases used have less conducting power than steam. The sudden blow on the piston which frequently occurs in the steam engine as shown by indicator diagrams is said to be entirely avoided in the Diesel motor. In the latter there is less than 7 per cent. clearance, and even this small space is filled with compressed air to a pressure of 500 pounds at an exceedingly high temperature. Petroleum is slowly and gradually injected into the space previously mentioned during a predetermined part of the stroke by means of compressed air, compressed by a separate pump to a higher pressure than that in the working cylinder. The result is claimed to be a gradual and complete combustion resulting in a noiseless and odorless exhaust.

In appearance the motor much resembles a vertical marine steam engine. The main cylinder and air pump are both single acting. The cylinder heads as well as the cylinder are water jacketed. When the engine is in operation a small reservoir is kept supplied by the air pump to a pressure of about three atmospheres higher than that in the main cylinder. This air is used for injecting the petroleum while the engine is working, and also for starting. When running, this engine is said to require little or no attention except to see that the oil cups are kept filled. The oiling of the main cylinder and of the air pump is done under pressure, the oil being forced in on the level of the lowest position of the upper packing ring.

The engine which is now being constructed in St. Louis will be of sixty horse-power, and will more-

over be the first that has ever been built in this country. A small Diesel motor is said to be on its way from Germany to New York City, where it will be used for running a dynamo at the Electrical Exhibition which is to be held in Madison Square Garden in May.

From the tests that have been made abroad it appears as though Mr. Diesel's invention was destined to fill a long felt want, for there would seem to be little use in striving to increase the efficiency of dynamos and motors by a fractional per cent. when such a large percentage of the energy of fuel is lost at the very start in the prime mover. With an efficiency of 25 to 30 per cent., as is claimed for the Diesel motor, the cost of fuel in an electric lighting plant, for instance, would be reduced by one-half or more, which should mean cheaper light for the consumers.

Although the Diesel motor would seem to be a step in the right direction, it is by no means an ideal machine as yet, for no apparatus can be looked upon as ideal that wastes 70 to 75 per cent. of the energy transmitted to it. It is gratifying to observe, however, that this difficult problem has been grappled with and partly solved, and undoubtedly it will not be many years before a prime mover makes its appearance that will have an efficiency in keeping with that of our electrical apparatus now in general use.

Electro-Metallurgical Industries.

processes as have met with the greatest success abroad. His various contributions that have appeared in *ELECTRICITY* from time to time on electrolytic soda and bleach, on the Siemens & Halske gold recovery processes, and on the extraction of zinc from its ores, have been valuable additions to the literature on these subjects.

In this issue appears an illustrated article by Mr. Kershaw, describing in detail the Hargreaves-Bird process of producing alkali and the results that have been attained after two years' experimental work at Farnworth, where the plant is located. The experiments were carried on with a view to determining the most suitable size for the electrolytic cells, and to ascertain exactly the proper method of working previous to the construction of a larger plant, to be located at Cheshire, for the production of alkali on a large commercial scale.

It is universally acknowledged that in certain of the electrolytic processes Europe, especially England and Germany, is far in advance of the United States. On the other hand, in the electrolytic production of copper this country is in advance of Europe, and turns out more copper by means of electricity than all the countries of Europe combined. Although processes for the deposition of metals have been known for many years, electro-metallurgy has made rapid progress only during the last decade. Up to ten or twelve years ago the attempts to produce or separate substances by electrical processes were mostly in the way of experiments, but it is these investigations that have paved the way for the flourishing industries in this line that exist to day. It can truthfully be said that at the present time there is no metal that cannot be deposited electrolytically, if we except possibly lead, and even this refractory substance can be deposited under certain conditions. As is well known, electro-deposition is exceedingly useful and can be advantageously applied to a variety of purposes, as for instance, goldsmith work, statuary and sculpture. Zinc can now be extracted from its ores electrolytically, and, as Mr. Kershaw has pointed out, there are establishments in Germany where electro-deposition of zinc is effected. In England the Cowper-Coles process, so ably described by Mr. Kershaw in a recent issue of *ELECTRICITY*, is employed to deposit zinc on hulls of ships, especially torpedo boats.

In the United States the first plant for the refining of copper by electricity was built some ten years ago by Edward Balbach at Newark, N. J. At that time the plant just mentioned and a plant shortly afterwards erected at Bridgeport, Conn., were the only large electrolytic plants in this country. To show the rapid progress that has been made in this industry, it is only necessary to state that at the present time we have eleven electrolytic refineries, which produce in the aggregate about 124,000 tons of copper annually, or almost five times the amount that is produced in the same way in Europe.

An excellent idea of the growth of this branch of industry in this country can be obtained by referring to Mr. Kershaw's article on the electrolytic copper industry which appeared in our issue of November 17, 1897, in which the production of copper for the four years previous to and including 1896 is given. In 1893 this country is said to have produced 37,503 tons of electrolytic copper; in 1894, 57,500 tons; in 1895, 87,000 tons, and in 1896, 124,000 tons. During this same period Europe produced but a total of 100,000 tons, or 25,000 tons a year.

Although it has been known for many years that potassium cyanide was a solvent of gold, it is only recently that processes of this nature have been tried on anything like an industrial scale.

According to Mr. Kershaw, potassium cyanide processes for the recovery of gold have not as yet been attempted upon an industrial scale in abroad, so that it would seem that even in this branch of electro-chemistry we are in advance of Europe, as several processes of this nature have already been worked successfully in western portions of this country. A plant located at Metal Creek, Cal., and known as the Shasta Gold Extraction Company's, is said to have been operated successfully as long as the local ores lasted. Another company was formed some time ago at Denver, Col., known as the General Gold Extracting Company, which operated for some time under United States patents based on the Pelatan-Clerici process, a process that apparently differs only slightly from that of Siemens & Halske, and which consists of a treatment of the crushed ore by agitation in a dilute solution of potassium cyanide by means of an electric current.

The electro-metallurgical industry may be said to be in its infancy, better arrangement of apparatuses being constantly devised and processes perfected. Mr. Kershaw's articles, describing in detail the various processes which are now being tried in Europe, and the results obtained so far are extremely valuable as furnishing a means of comparison between the progress that has been made abroad and in this country. It is further extremely gratifying to observe that we in no wise suffer by this comparison.

Under the Searchlight.

Notes and Comments on Various Topics.

In one of the daily papers Mr. Thomas A. Edison is credited with the following statement:

There is only one "scope," and that is the kinetoscope; only one "graph," and that is the projectograph. All others are piratical imitations. I shall drive them out of the field, taking no prisoners and showing no quarter.

* * *

Do They Keep a Buffet There?

(From the Boston Advertiser.)

A traveling man who sells supplies to the General Electric Company says that it is a veritable tonic to visit the works of the company at Schenectady. There is a steady rush of work and the business is being done at a profit. As he expressed it, the company "has money to burn," and the signs of prosperity are plainly to be found everywhere.

As the stockholders of the G. E. Company must necessarily be very much run down in health awaiting dividends that have been constantly hinted at by the various booming agencies of the company, it might be well for them to visit the works and get

some of the tonic referred to in the above paragraph. They should certainly avail themselves of this opportunity to get their health restored, as promises and predictions have long since ceased to bring relief and now only aggravate their malady.

* * *

FREQUENT disagreements between the opinions of an editor of a country paper and one of his subscribers recently brought out the following: "Brother, don't stop your paper just because you don't agree with the editor. The last cabbage you sent us didn't agree with us either, but we didn't drop you from our subscription list on that account."

* * *

The Value of Their Contracts.

The Metropolitan Street Railway Company of New York is about to erect the largest power house in the world at the foot of East 96th street. It will take \$300,000 worth of machinery to equip it and the General Electric Company has been given the contract. The station will have a capacity of 70,000 horse-power.—*Floating item.*

Is this another sample of the boasted prosperity of the General Electric Company? Where is the profit in taking a contract to install electrical machinery at \$4.29 per horse-power?

* * *

A NOVEL use to which the telephone was put was related as follows in a recent number of the *New York Sun*:

A Chicago man had a fox terrier of which he was very proud, and the dog was completely devoted to him. He had to go to some place in Michigan on business which kept him away for several days. As soon as he had gone the dog began to suffer from a severe attack of loneliness. He wouldn't eat, and lay about mooping until the man's wife was afraid the terrier would die before his master's return. One night the man went into the station of the town where he was stopping and said that he wanted to talk to his dog. So connection was made with his house and the receiver was placed to the terrier's ear. Instantly he recognized his master's voice and began to frolic about and bark at a great rate. Two or three times after that the Chicago man repeated the performance, and he didn't mind the \$10 or \$12 that it cost him in the least.

* * *

The Last Application.

At San Francisco a company, composed of James McKendrick, Abraham Blumenthal, William Loewi, J. C. Meyerstein and L. F. Humphrey, has been incorporated, with a capital stock of \$1,000,000 and bearing the name of the "Electric Mortar Hardener Company." If this is not running electricity into the ground, it comes pretty near to it; still if the process gives us stiffer mortar than some of our builders have been known to use, the company deserves success.

* * *

THE Signal Office of the War Department at Washington is said to be deluged these days with suggestions and plans, with balloon, flying machine and other warlike devices, all of which appear to have some fatal defect. One genius is positive he has solved the problem of aerial navigation, and thinks his airship would be of inestimable value to the Government in case of war. His machine is in the form of a fish-shaped balloon, with electrically-operated propellers. Another would-be inventor suggests putting a powerful magnet in a torpedo which would lie along the shore. A steel ship passing in the neighborhood would, in the opinion of this genius, draw the torpedo up to its side, to be immediately followed by an explosion and the sinking of the vessel. There is certainly nothing like having a vivid imagination!

* * *

It is stated that the Electrolytic Marine Salts Company, which was originally founded on a heavenly vision and was organized to extract gold from sea water, and which we referred to in our issue of December 1, 1897, is now operating 100 machines, each of which extracts daily an average 7.87 pennyweights of gold and almost 15 pennyweights of silver. In other words, the plant is said to yield in

gold alone about \$125 a day on a \$50,000 investment. Ninety-one per cent. dividends such as this are certainly few and far between. Is this another stockjobbing scheme?

THE MEASUREMENT OF INSULATION RESISTANCE BY ALTERNATING CURRENTS.*

For some time past, a rule has been in force in Germany which requires that the insulation resistance of any electric installation which is to be connected to the supply mains shall be at least equal to

$$\frac{1,000,000}{n} \text{ ohms, when } n \text{ is the number of lamps fixed;}$$

and, further, that the test shall be made with a pressure equal to that at which the circuit will be worked. In order to avoid the necessity of carrying about a battery capable of giving a testing pressure equal to the working pressure of the circuit, various methods have been suggested of making the test by means of current taken from the supply mains; and these methods, particularly in the case of alternating current supply, have lately formed the subject of articles in both German and French technical journals.

One of the methods proposed consists of connecting one pole of the supply mains through an alternating current voltmeter to the circuit to be tested whilst the other pole of the supply mains is earthed, the insulation resistance being calculated, as in the case of direct currents, from the formula,

$$R = G \times \frac{V - V'}{V'}$$

where G is the resistance of the voltmeter, and V and V' respectively the readings of the voltmeter when connected between the two poles of the supply mains, and between one pole and the circuit under test. Objection is taken to this method, because the resistance of the ordinary electro-magnetic voltmeter for alternating currents is so low that the instrument cannot be used to measure the insulation resistance of a circuit where the number of lamps fixed is small. The objection is, of course, an important one, but we don't think that accurate results would be obtained by this method, even on circuits of which the insulation resistance came well within the range of the voltmeter, unless this latter was specially arranged so that the non-inductive resistance in series with the working coils formed a very large percentage of the total resistance of the instrument. Again, although one pole of the mains might be earthed if each installation was fed by a separate transformer, there would be very great objections to the earthing of one pole of a low tension distributing network.

To get over the first-named difficulty of want of sensitiveness, an instrument has been devised by the Allgemeine Electricitäts Gesellschaft in which the fixed coil is connected across the terminals of the supply mains, and is arranged to take a current of 1 ampere or more so as to produce a very strong field, whilst the circuit of the moving coil, which is of high resistance, is connected between one pole of the supply main and the circuit to be tested. This type of instrument should certainly give much better results than the ordinary voltmeter, but the objection to earthing one pole of the supply mains still remains, and renders this particular method of testing inadmissible in many cases. A slight modification of the method of testing would render the earthing of one pole unnecessary, but it would at the same time reduce the testing pressure from that between the supply mains to the pressure between one pole and earth; and this might be anything between the full working pressure and half that amount, according to the condition of the distributing network. Of course, the objection to earthing might be removed by using a small equal ratio transformer to supply the testing current, but this would be nearly as cumbersome to carry round as the testing battery.

* From the *Electrical Review*, London.

A bridge method has also been proposed and tried, the galvanometer being replaced by a telephone, and the battery by a connection to the supply mains, whilst the terminals to which the unknown resistance is usually connected are joined up, one to the circuit under test and the other to earth. This method has been tried with a working pressure 120 volts and a frequency of 50, but was not found sensitive enough to give satisfactory results, and although it is stated that accurate measurements could be made when the testing current was supplied by an induction coil instead of from the supply mains, the method does not appear to us to have any advantages likely to bring it into general use.

If any method is to be used in which the testing current is taken from the mains, we would suggest that the circuit to be tested should be connected to one pole of the supply mains through a non-inductive resistance, and that the potential differences between the terminals of this resistance and between the supply conductor and earth should be measured by an electrostatic voltmeter. The insulation resistance of the circuit would be given by

$$R = r \times \frac{V - V'}{V'}$$

when r is the value of the non-inductive resistance, and V and V' respectively the readings of the voltmeter when connected to earth and across the terminals of the resistance. The value of the resistance, r , must, of course, be such

that it is at least equal to $\frac{R}{x - 1}$ if R is the highest insulation resistance to be measured and x the ratio of the highest and lowest readings of the voltmeter.

Mean Horizontal Candle-Power.

The mean horizontal candle-power of an incandescent lamp is usually taken as the measure of the light emitted. This is perhaps the best measurement to take, but with certain of the new types of filaments will have to be replaced by the mean spherical candle-power. The mean horizontal candle-power can be obtained either by the laborious method of taking a large number of readings at different angles, or by spinning the lamp so as to obtain optically the mean candle-power. There have been doubts, though, on this spinning process as to whether it will give accurate results. Deformation of the filament due to centrifugal force would be the most likely cause of error, if any. Mr. C. P. Matthews contributes an article on this subject to the current number of the *Physical Review*. His experiments were carried out at the Purdue University, and show conclusively that no such error exists. Thus the whirling lamp gave a mean horizontal candle-power of 9.649, while the figures obtained by plotting the series of readings for different angles and integrating the curve was 9.655 c. p. This shows an error of .06 per cent. only, which is very well within the limits of photometric accuracy.

The Naval Appropriation Bill.

Among the items contained in the Naval Appropriation bill are the following of interest to the electric industry: An addition to the electric light system at the Brooklyn Navy Yard, \$15,000; steam generator for heating purposes and electric plant at the League Island Navy Yard, \$5,500; for improvement of the electric plant at the Washington Navy Yard, \$16,000; for enlargement of electric plant and concentration of steam at the Norfolk Navy Yard, \$20,000; extension of the electric light system at the Mare Island Navy Yard, \$15,000; for electric plant for Puget Sound Naval Station, \$9,800.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES OF EUROPE.

BY JOHN B. C. KERSHAW, F. I. C. (LONDON).

Chapter XV.—The Hargreaves-Bird Alkali Process.

In Chapter IV* of this series, a description of the cell patented by Messrs. Hargreaves & Bird was given, together with figures showing the results obtained in trial tests extending over 59 days at Farnworth. In Chapter VIII† reference was made to the industrial trial of this process about to be inaugurated by the St. Gobain Chemical Company in France. The writer is now enabled to give further details of the trial runs of this process at Farnworth, this information having been obtained by him during two personal visits of inspection of the plant, made in November, 1897, and January, 1898.

The request made for permission to visit the works at Farnworth was cordially granted by the company's managers, and every facility was afforded to enable the writer to acquaint himself with the details and working results of the process. He takes this opportunity of acknowledging the courtesy of Mr. James Hargreaves and Mr. C. C. Connor on the occasion of his two visits. The experimental work at Farnworth has now been carried on for over two years, and the form and size of cell, and the method of working, most suitable for the larger plants now contemplated are stated to have been finally settled. It is somewhat unusual to find any company in possession of valuable patents taking so much time and trouble to find out the best conditions of work before selling their patents to the general public. As a general rule the patents are sold first, and the best conditions of work are found out afterwards—at the public's expense. Too often there are no best conditions of work to be found, and the public is left in possession of worthless patents. The change inaugurated by the General Electrolytic Parent Company is refreshing to those who seek honesty in business and industrial affairs, and one can only hope that the example they have set will find more imitators on both sides of the Atlantic. The energy at Farnworth is supplied by an Otto gas engine of 14 nominal horsepower, driven by gas from a Dowson gas producer. This engine drives a dynamo, made by Holmes of Newcastle, by belting at 350 revolutions per minute. The dynamo is built to deliver 2,200 amperes at 5 volts. The whole of this current is used in the single large cell that has now been in operation for some months at Farnworth.

Internal dimensions of this cell are 60" x 120" x 14" wide. Mr. Hargreaves claims that it is the largest electrolytic cell for the production of alkali that has yet been built. It represents in fact one unit of the larger plant about to be built, and this will only differ from the plant at Farnworth in the number of such cells that are erected. The external appearance of the cell is illustrated in Fig. 1. The interior of the cell, after removal of one of the combined diaphragm cathodes which form its sides is shown in Fig. 2. The five vertical columns of rough blocks are the anodes. These are formed by roughly shaping blocks of gas carbon, each of which is pierced by a perfectly round 3" hole. These blocks are then fitted on to a central conducting shaft made of a lead-copper alloy, and the parts where bare metal is exposed are covered with a special cement. Six of these built-up anodes are used in this large cell, and they are stated to be superior in working results to any forms of carbon anode yet tried. These anodes are the invention of Mr. C. C. Connor of Belfast, one of the directors of the company, and the patents are now owned by the "General Electrolytic Parent Company," who likewise own the Hargreaves-Bird patents.

The solution of carbonate of soda found in the two outer or cathode chambers of the cell runs away

continuously into the small iron vessels placed below the cell.

Samples of this liquor were taken on both occasions by the writer, and these yielded on further examination the following mean results:

	Diaphragm Age.	Sp. Gr.	%Na ₂ CO ₃	%NaCl	Molecules NaCl per 100 mols. Na ₂ CO ₃
1st visit..	40 days.	1.125	10.94	.94	15.6
2d visit..	1 ½ days.	1.094	10.44	.10	1.7

The normal life of the diaphragms, which have a cell surface of 50 square feet and are from ½" to ¾"

FIG. 1.—EXTERIOR OF HARGREAVES-BIRD CELL.

in thickness, is thirty days, and those in use on the occasion of the writer's first visit to Farnworth were being purposely worked for a longer period in order to see the results. The high percentage of undecomposed salt in the solution flowing from the cathode chambers of the cell on the first occasion, and the very low percentage of the same on the

FIG. 2.—INTERIOR OF HARGREAVES-BIRD CELL.

second occasion, show that the age of the diaphragm is intimately connected with its efficiency in preventing diffusion of the brine from the inner (anode) to the outer (cathode) chamber. The manufacture and renewal of the diaphragms will therefore form a considerable feature in the industrial working of the Hargreaves-Bird process.

The alkaline solution flowing from the cell contained no chlorine or hypochlorites. At Farnworth it is concentrated and then allowed to crystallize, and the decahydrate (Na₂CO₃ + 10H₂O) is obtained. It is considered that this form of soda will prove the most profitable, though both soda ash and caustic soda are alternative products. The chlorine liberated at the row of compound anodes in the inner chamber

of the cell is led away by the vertical pipe seen to the right hand of Fig. 2, by which the constant overflow of brine is also carried away.

The brine and chlorine gas are led to a separating well, from which the gas passes to a bleaching-powder chamber, or to a chlorate of soda tower, both of these chemicals being manufactured at Farnworth. The chlorine gas is quite free from hydrogen, and the bleach and chlorate made at Farnworth have been of excellent quality. It is stated that one of the difficulties of the processes in which mercury is used as cathode in order to form an amalgam is due to the presence of hydrogen in the chlorine gas from the anode chambers; this leads to considerable difficulties in the manufacture of high strength bleach. The chlorine gas from the Hargreaves-Bird cell is free from this impurity and this difficulty is avoided.

The brine in the separating well comes into contact with fresh salt, and after restoration to its original strength, it is pumped back into the cell, the circulation being kept up continuously. Owing to the heating effect of the current, and to the heat transmitted by the diaphragms from the steam condensing on their outer sides, the temperature of the brine in this inner anode chamber of the cell is maintained at 70° C. The following figures of the last two consecutive runs of the plant at Farnworth give the details from which the currents and energy efficiencies may be calculated. These have been worked out by the writer upon the same basis as those given in Chapter IV (l. c.) and are given in the last two columns of the table. The amperes, volts and pounds of salt decomposed are all mean figures:

Period of run.*	Amps.	Volts.	Salt per 24 hours.	Efficiencies %.	
				Current.	Energy.
Sept. 15—Oct. 11.	2081.5	4.2	217.3 lbs.	92.7	50.05
Oct. 12—Nov. 17.	2089.8	4.24	218.06 lbs.	90.4	48.99

* The cell is run continuously (day and night) after new diaphragms have been placed in position, until these are worked out. The normal life, as already stated, is thirty days.

The current density now being used in working this cell is rather higher than that originally used, the gain being an increased yield from the same plant. Under normal conditions of work the current density employed is 21 amperes per square foot.

This process will shortly be launched upon a large scale in England, negotiations for the purchase of land and brine pumping rights having been already commenced. The locality chosen is Cheshire. Those in charge of the arrangements have not yet decided whether steam engines or gas engines shall be used to generate the electric energy, the advantages of the latter being not only lower cost of the KHP. hour, but also the production of the carbonic acid required for the cathode chamber of the cell, without any extra costs for raw materials or apparatus by which to generate it.

This process has undergone such a long trial at Farnworth, that one must feel confident the difficulties incident to all new processes have been discovered and successfully overcome, and that reliable data upon which to base the estimates of cost per ton have been obtained. The determination of the directors of the General Electrolytic Parent Company to now offer their process to the general public, and to obtain the requisite capital for the construction of a large works, is proof of confidence in the value of their process. The writer hopes that freedom from unexpected difficulties, and financial success, in their future operations may be the reward of the lengthy experimental trials that have taken place at Farnworth.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

† ELECTRICITY, November 10, 1897.

A SURVEY OF THE POSSIBILITIES OF ELECTRIC HEATING AND COOKING.*

BY W. P. ADAMS, A.K.C., A.I.E.E.

Many of you will doubtless be able to call to mind the old fable in which a visitant from another world was vastly puzzled by seeing a mortal blowing upon his fingers to warm them, and later upon his hot food to cool it. It is not by any means uncommon to find this species of inordinance occupying the minds of members of the public when electrical engineers claim that electricity will produce the coolest light and also cook one's food and heat one's house. As this feeling is not confined solely to members of the public, but is shared by some gentlemen of our own profession, you will perhaps be inclined to agree that it is pardonable in a layman.

My desire this evening is if possible to pave the way to a better understanding of the possibilities of electric heating so that engineers may be able to assume that confidence as to its merits which is necessary before any real progress can be attained, and which is at present lacking in many a professional mind. The feeling is general that the cost is, and will be to the end of the chapter, so great that its adoption can only be hoped for by those of more than ample means, but I hope to show that while it undoubtedly deserves to rank as a luxury it will be well within the means of those with average incomes when the cost of current is somewhat modified. The reason why electric heating, more especially in the direction of cooking, is able to compare favorably with other methods is, that the heat can be applied just where it is required, and there is remarkably little waste. I well remember in my student days being struck with a description of the Norwegian cooking pot in a copy of Deschanel's "Heat," and wondering if the principle could be applied to cooking by electricity. I saw that if the contents of the pot were raised to boiling point, little heat was required to maintain it at that temperature. In a general way this principle is used in the electric oven.

Notwithstanding this, heating appliances do absorb what appears to be a large amount of electricity, and many electricians, especially those more closely connected with electric lighting, are surprised at the large amount of current which is necessary for cooking purposes, and mentally compare what might be done with the same current if devoted to the production of electric light.

It will perhaps render clearer the remarks I am about to make if I give you some general idea of the current necessary for producing certain results.

As it is in the direction of electric cooking that I anticipate the largest development in the near future, I shall confine myself at first to a consideration of this subject.

In a kitchen suitable for supplying the needs of a family of from eight to ten persons the following apparatus would be necessary: Oven, absorbing 2,500 watts when heating up for about 15 minutes, and on the average about 1,200 watts afterwards. Breakfast cooker, wound for two circuits, each absorbing 600 watts. Two grillers, each wound for 500 watts. Two frypans, also wound for 500 watts, and several hot plates for warming ordinary saucepans, or in place of these several self-contained electric saucepans. These plates or saucepans would probably absorb 1,500 watts together. The household supplied from such a kitchen would probably have a maximum demand for not more than 2,500 watts for lighting purposes. The total watts which could be absorbed by the cooking apparatus is 7,200. It must, however, be borne in mind that these various appliances are used at different times, and never altogether.

We shall now consider the difficulties in the way of the adoption of electric cooking. First and foremost is the question of the cost of current. This is

all important. In addition to this the first outlay cannot be overlooked, owing to the rather high cost of the apparatus.

The largest field for the development of electric cooking is undoubtedly in private houses supplied from central stations, and if there is to be any large extension in this direction the central stations must be prepared to supply current at a more moderate price than is now charged for lighting. It is generally recognized that electric cooking will eventually prove to be the means of solving the much vexed question of securing a day load for central stations; and in view of this fact many of the central stations offer special terms for supplying electric currents for heating. A number of the central station engineers are, however, still doubtful as to the advantage of adopting electric heating, partly owing to the question of the load overlapping the lighting load. This question I shall touch on later, but I would venture to point out that, if the demand is spread over a sufficient number of hours, electric heating is worthy of consideration quite apart from electric lighting, and it would therefore pay to put down extra plant to meet the additional demand. In fact, I do not think the day is far removed when the demand for current for electric heating will vastly exceed that for lighting purposes; and I submit that the solution of the question lies mainly in the hands of the present suppliers of electricity. If they are prepared to adopt a liberal policy of supplying electricity for heating purposes, perhaps at little more than the actual bare cost, they will very soon find that the improved conditions under which they run their plant will begin to repay them handsomely.

The price to be charged is of the greatest importance, and I will therefore make a few comments upon the methods of charging now in vogue. Anyone who makes a careful study of *Lighting's* very valuable "table of costs," will observe that it is becoming usual to make the charge for heating and power about half that made for light. A usual figure is 3d. per unit, while some suppliers have brought the price down to an even lower figure. I may say at once that the ideal to be aimed at for heating and power purposes is a charge of 1d. per unit, and although it is only possible at present for one or two companies to charge such a figure and cover the bare cost of production, I think the figure is well within the range of practicability, and with a rapidly growing load on supply stations, I think it will soon become general. It is noticeable that the local authorities are moving more rapidly in this direction than supply companies. I would commend this to the attention of the supply companies. Their policy of making high charges is, to say the least of it, unprogressive. Only about four are charging so little as 3d., while 26 of the local authorities supply at 3d. or less, 13 of these charging 2d. and less.

The Wright system of charging for electricity appears to be securing considerable support amongst central station engineers, and the maximum demand system seems to have been receiving even greater favor. With both of these systems I can foresee a trouble in connection with the supply of electricity for heating purposes.

Under the Wright system it is conceivable that the demand meter may run up to a most unusual height, through the inconsiderate switching on of a number of the heating appliances together, the indicator therefore furnishing quite an abnormal record upon which the charges are to be based. Again, with the maximum demand system, if the charges are to be made upon the usual understanding that the whole apparatus is to be run for an hour at the maximum charge before any reduction is made, the charge cannot come down to anything like a reasonable figure. It is of course obvious that the whole of the appliances will not be in use together, and I think this point is worthy of close consideration.

In a certain kitchen it was found that the various cooking appliances were in use for from five to seven

hours a day, during which time the highest point reached was 1.5 kilowatts. The average consumption during the day was from 8 units. It will thus be seen that if generating plant to the capacity of 2 kilowatts was installed for supplying these cooking appliances it would have an earning capacity of about 1,400 units per kilowatt installed per annum.

I find that the number of units sold per annum per kilowatt of plant installed varies considerably among the different stations in country towns where the load is almost exclusively a lighting one and the supply is very small during the day time; about 400 or 500 units represent the work done during a year by one kilowatt of plant installed. In the larger towns, where there is probably a small day supply for power as well as one for lighting in dark offices and basements, the demand is larger. In Brighton, 840; Edinburgh, 640; Glasgow, 696; Manchester, 700. It will be seen that Brighton, which might almost be termed a country town, as there are no factories there to absorb power in the day, shows the best results of those named. This, I think, is traceable to the moderate nature of the charge for current.

As so little has been done in a general way in this direction, it is not possible to obtain exact data indicating in any definite manner what the load curves due to heating are likely to be, but I have been able to build up from figures at my disposal a very rough load curve for cooking appliances. It is obvious that the peaks of the load will be at the different meal times. The load will run up from 6 A. M. to 7 A. M. rapidly. After this it will be fairly level to 8:30. It will then drop rapidly until about 9 when the curve will begin to rise again for early dinner and lunch; from 10 until 1 it will be fairly level, reaching its maximum at a little after 12. After 1 it will fall rapidly until 3 or 4 when it will begin to rise a little for tea. It will continue to rise and will attain its maximum between 6 and 7. After this the decline will be fairly rapid, and there will probably be a little rise again between 8 and 9. I have obtained these rough general results from the study of single curves, making due allowance for the overlapping of the different curves in those cases where meals are taken earlier or later.

As a load for summer time, cooking should prove invaluable to supply stations, and the question of overlapping during this period does not arise. I think it is perhaps unnecessary to deduce evidence that electric cooking would be of great advantage to central stations during the summer time, but I may point out that the introduction of penny-in-the-slot gas meters in the South Metropolitan Gas Company's area has led to an enormously increased consumption of gas in summer, mainly for cooking purposes. The gas companies suffer (if we can say that such wealthy monopolies suffer at all) from light loads in the summer time, in the same manner as do electric light stations.

In winter, however, the conditions will be different. A certain amount of overlapping will occur owing to the prevailing fashion of late dinners, but I submit that the load for electric heating is likely to be of sufficient importance to warrant putting down additional plant to meet this.

Much, of course, depends upon the acuteness of the peak as to how this question is to be met. If it can be arranged, it will be desirable to utilize for heating during the day the plant installed for lighting purposes, but if the demand for heating grows to such an extent as to greatly surpass the lighting load, the question becomes of less importance. It is not, perhaps, within my province at this moment to suggest how this difficulty is to be met, but with some stations in this country the question does not arise at the present time, as ample plant has been installed to meet the lighting requirements and still leave a balance in hand to allow for the overlapping. This will be seen by looking through the columns in

* Read before the Northern Society of Electrical Engineers, Manchester, Eng., January 21, 1898.

Lightning's table of costs, giving the maximum load and the kilowatt capacity. A number of stations appear to be provided with twice the amount of plant required to meet the maximum demand. Of course some portion of this is reserve plant, but there still remains a good balance in hand to meet this contingency.

I am inclined to think that a secondary battery would prove of great value in meeting the peak difficulty, as there are several depressions on the day load curve which could be filled up if the generating plant were employed during these times of light load for charging the accumulators. How far it is possible to economically utilize accumulators for this purpose in alternating supply stations is an open question.

While considering the charges made by the various supply companies it is noticeable that several have adopted the enlightened policy of charging for power

getting a satisfactory day load the time does not seem very far distant when such a consummation will be reached.

The results obtained at Cardiff are interesting. It is one of those towns which adopted the policy of charging for heating and power purposes at a less price per unit than the actual works price. The returns for the year 1895 show a consumption of 400 units per kilowatt installed. The works cost was then 3.1d. per unit, and the total cost 3.69d. per unit, the charge for power being 3d. In the return for 1896, I find that 700 units were sold per kilowatt of plant installed, the works cost had come down to 2.86d., per unit, and the total cost to 3.06d. per unit. This satisfactory result may be due to local circumstances favoring rapid development, but the figures appear on the surface to be significant. I also desire to draw attention to the following supplies: Sheffield is charging 5d., with the works

electricity is used, but this is fixed so that it is of little value in the way of reducing the price.

It seems almost incredible that, in these enlightened days, the foremost city in the world should be one of the worst supplied in the matter of electricity.

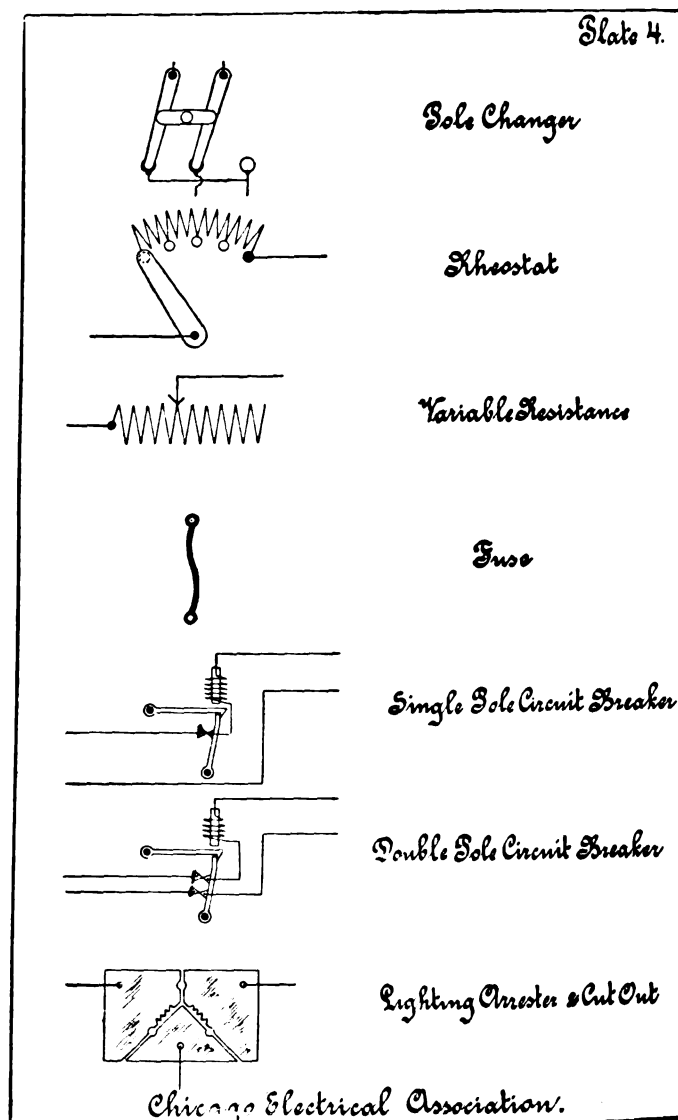

(To be continued.)

STANDARD SYSTEM OF ELECTRICAL DIAGRAMS.

(Continued from page 104.)

In last week's issue we published Plates 1 and 2 of the Standard System of Electrical Diagrams. These two first plates showed the proposed diagrams for dynamos, motors and batteries. We give to day Plates 3, 4, 5 and 6. In our next week's issue we will conclude the series by publishing Plates 7 and 8.

The diagrams on Plate 3 of electrical measuring instruments need no comment, owing to their ex-

and heating purposes a price which is actually less than the total works cost. Putting on one side for one moment the question of overlapping, it is obvious that this is a right policy to adopt as assuming that the plant need for lighting is employed for supplying heating appliances, the charge for rent, management, etc., will remain practically the same.

The following facts with regard to charges by different supply companies are worthy of note: In Edinburgh the charge for power is 2d., the works cost is .63d., and the total cost, 1.13d. per unit. In Glasgow the charge is made on the maximum demand system, 6d. the first hour and 2½d. after. The works cost is 1.32d., and the total cost 1.92d. per unit. In Liverpool the charge is 2d., the works cost 1.14d. and the total cost 1.77d. per unit. These charges are moderate, but I think in some cases would still bear reduction. It is to the large towns that we look at first for the introduction of the penny per unit charge, and if these towns can succeed in

cost at 1.48d., total cost 2.2d. per unit. The Westminster supply is charging 4d., the works cost being 1.24d., and the total cost 2.09d. per unit. The Chelsea Co. charges 4d., with a works cost of 1.48d., and a total cost of 3.08d.; and, last but not least in more senses than one, the City of London Electric Lighting Company is charging 8d., with a works cost of 2.46d. and a total cost of 3.5d. per unit. I have the misfortune to be situated in a district served by the City of London Company, which company holds a monopoly and takes advantage of this to maintain a charge which is worthy of the very early days of electric supply. Although their works cost compares anything but favorably with other large towns having in many cases a much smaller output, I think you will agree with me that the charge of 8d. is somewhat extravagant, and I may say that such a charge absolutely prohibits any demand for current for power and heating purposes. It is true that a rebate is made if more than a stated quantity of

treme simplicity and the unmistakable evidence which they bear to their identity.

In the matter of single and double circuit breakers, many forms of diagrams were considered, each of which would probably have their advantages in certain places. This brings out well the fact that these diagrams must be taken merely as a guide, and not as a rigid code which must be absolutely followed. For instance, if it were essential that the circuit breaker should have an operating coil in each of the line wires, then it must be left to the designer or illustrator to make his own diagram for illustrating the particular case in hand.

On the simple telephone diagrams but little comment is needed. It would be well if all would adopt the form of transmitter shown, from the fact that its construction is so extremely simple.

The listening and ringing key for telephone switchboards is a simple representation of one of these pieces of apparatus in common use. The re-

marks made concerning the out-outs will apply with equal force to these.

The diagrams for polarized bells are shown. The one on the right hand side is preferable where its meaning can not be mistaken. The almost universal adoption of this form of diagram has led the committee to show it here, although unless one is familiar with polarized bells in telephone work it must be said that it is not at all suggestive. In cases where it is thought best to be extremely explicit, or where the immediate context of the diagram does not suggest the use of a polarized bell, the diagram on the left is to be preferred.

In the diagram for a polarized relay, by changing the plus and minus signs from one side of the armature to the other, it may be indicated that the relay will close on a minus current and open on a plus

AN ELECTROLYTIC PROCESS FOR THE MANUFACTURE OF PARABOLIC REFLECTORS.*

BY SHERARD COWPER COLES.

Glass mirrors at the present time are almost exclusively used for projectors for searchlights and similar purposes, on account of the difficulty that has been experienced in producing a true metallic reflector that will not readily tarnish when exposed to the heat of an arc light. One advantage of a metallic reflector is that the rays from the carbon points are collected into a parallel beam by means of refraction only, and is not catadioptric, as most glass mirrors are. Spun reflectors are never true, as it is found in practice impossible to spin them quite true to the moulds. Experiments have been made with

placed in a suitable ring and frame (which I will describe later on), and immersed in an electrolyte of copper sulphate, the mould being rotated in a horizontal position, the number of revolutions being about 15 per minute. The copper adheres firmly to the silver, and together they form the reflector, which is subsequently separated from the glass mould by placing the whole in cold or lukewarm water, and then gradually raising the temperature of the water to 120° Fahr., when the metal reflector will leave the glass mould, due to the unequal expansion of the two. The concave surface of the reflector obtained is an exact reproduction of the surface of the mould, and has the same brilliant polish, and requires no further treatment to answer all the purposes of a reflector, with the exception that it must be coated with a film of some suitable

current, or vice versa. This is a feature which will be found at times very convenient.

Protecting Power Lines from Lightning.

The protection of power transmissions from lightning was made the subject of a paper read to the students of the London Institution of Civil Engineers on February 11 by Mr. J. T. Morris. The author said that the importance of the efficient protection of electric power transmission circuits from lightning was shown by the fact that in some of the earlier installations it was found more economical to shut down the generating plant than to run the risk of burnt-out armatures or similar mishaps during severe thunderstorms. The danger existed not so much in the conduction of the discharge to earth as in the arc started by lightning being maintained by the current. The author demonstrated the relation between the sparking distances and voltage, by means of a curve, and he showed that the discharges from which the line must be protected were: (1) those due to lightning actually striking the line; (2) the rush and surges of electricity induced in the line; (3) those due to slow accumulation of the charge. The first were extremely rare and the third only occasional, but the second were the most frequent.

a view to substituting cast metal for glass, but the cost of grinding and polishing, and the unsatisfactory surface that is obtained, have resulted in the attempts being abandoned. Stamped reflectors have also been tried, but with no more satisfactory results. The present process I propose to describe to you is an electrolytic one, one of the chief features being that the surface produced requires no after polishing or trueing up. When once a true mould has been produced, any number of reflectors can be taken from it at a nominal cost. A glass mould is prepared, the convex side of which is accurately shaped and polished to form a true parabolic or other reflecting surface. As the mould only requires shaping and polishing on the convex side, it is comparatively cheap as compared to a glass reflector, which has to be ground on both sides. On the prepared surface is deposited a coating of metallic silver, which is thrown down chemically on the glass and then polished, so as to ensure the copper backing being adherent to the silver. The mould thus prepared is

* Paper read before the Institution of Electrical Engineers, London, February 9, 1898.

metal to prevent tarnishing. Palladium is found to answer this purpose best, as a bright coating can be deposited rapidly to any desired thickness; the palladium resists tarnishing and the heat of the arc to a wonderful degree.

Palladium is a silver-white hard metal, and is sufficiently ductile to be rolled into thin sheets. Its specific gravity is about 12, being half that of platinum. The present price of palladium is about double that of platinum, but, its weight being only one-half, the same area can be covered at the same cost. It melts at an extremely high temperature—about the same as wrought iron. When only slightly heated in hydrogen gas, it has an extraordinary power of absorbing mechanically large volumes of this gas. Graham investigated this very curious phenomenon, and found that a piece of palladium foil when heated below 212° Fahr. takes 240 times its volume of hydrogen, but that it had not the power of absorbing oxygen or nitrogen. At a moderately high temperature palladium assumes a blue color, and the formation of a thin film of oxide, which it loses at a higher temperature, due to the

decomposition of the oxide. Palladium is not readily attacked by sulphuric or hydrochloric acid.

In carrying out the manufacture of reflectors by this process, it is essential that the glass mould be perfectly clean and free from grease before the silver coating is applied. It has been found, however, that, if the cleaning is solely effected by chemical means, there is a great liability of the silver adhering too firmly to the glass, whereby the mould is in danger of being broken during the removal of the reflector. This difficulty has been overcome by cleaning the glass mould with a suitable paste or powder such as peroxide of iron, then removing such paste or powder by washing the glass with a 50 per cent. solution of ammonia. It is necessary that this cleaning operation be repeated prior to the production of each reflector. After the convex side of the mould has been properly cleansed as described, a thin coating of metallic silver is applied as follows: Ammonia is added to a solution of nitrate of silver until the precipitate that is first formed is redissolved, then re-precipitating by caustic soda, again dissolving in ammonia, then adding glucose to the solution. Excellent results have been obtained with a silvering solution of the following components, equal parts of each being used: Silver nitrate, 0.5 per cent.; caustic potash, 0.5 per cent.; glucose, 0.25 per cent. The surface of the mould to be coated is immediately dipped into the solution, when it becomes coated with a film of silver. The silver coating is thoroughly washed, and then allowed to dry, and the silver which has been deposited is burnished bright with a piece of cotton-wool and peroxide of iron, preferably precipitated by ammonia from a dilute solution of ferrous sulphate. The cost of the silvering is found to vary from 2d. to 4d. per inch diameter. I have here a film of the silver and copper stripped from a glass mould, which is quite transparent to transmitted light having a green tinge, but is capable of reflecting light.

(To be continued.)

A May Meeting of Street-Car Men in Chicago.

At a meeting of the Executive Committee of the Street Railway Men's Association of Illinois, held in Chicago on the 19th ult., at which a number of representatives of supply houses were present, the question of holding an Exposition in Chicago in May next was thoroughly discussed and the general opinion was that the prospects were favorable for a successful exposition of street railway supplies at that time.

The meeting was called to order by W. J. Cook of the McGuire Manufacturing Company and at the close of the discussion he was instructed to appoint four others to act with himself to make immediate arrangements for the Exposition. The members of the Executive Committee of the Association present were President W. H. Patterson of Bloomington, Secretary C. H. Minary of Springfield, C. W. Barker of Peoria, W. L. Ferguson of Decatur, and W. F. Brennan of Chicago.

The firms represented were: Page Iron Works, Leschen, McComb & Wight, J. A. Roebing's Sons Co., Washburn-Moen Manufacturing Company, New York Insulated Wire Company, Abendroth & Root Manufacturing Company, Central Electric Company, Electrical Appliance Company, Griffin Wheel Company, McGuire Manufacturing Company, Adams & Westlake Company, McGill & Pomeroy, Simonds Manufacturing Company, E. T. Burrows Manufacturing Company, General Electric Company, Westinghouse Electric & Manufacturing Company, Peckham Wheel and Truck Company, Ajax Forge Company, Standard Railway Supply Company, Washington Carbon Company, Chicago Varnish Company, Wells & French Company, Western Electric Company, H. W. Johns Manufacturing Company, J. J. Ryan & Co., the Sargent Company, Heath & Milligan Manufacturing Company and W. D. Alling & Co.

LONDON NOTES.

[From our London Correspondent.]

Dr. Lodge on Coherers.

Dr. Oliver Lodge has been communicating a paper to the Physical Society on "Electric Signaling Without Connecting Wires," and he of course had a good deal to say about coherers. The coherer principle, he said, can be either applied to a purely magnetic or to the Hertzian system. It was first used by him in devising lightning guards, and afterwards by him in his magnetic system of telegraphy by inductive circuits, each in series with a Leyden jar, a pair of knobs in near contact or other overflow gap being provided in the receiving apparatus. This was the first meaning of a coherer in the electrical sense as used by himself. It referred to a single contact between two metal knobs. The term has since been extended by others to the filings-tube of M. Branly, and some confusion has arisen, for M. Branly does not consider simple coherence and break explains fully the behavior of his instrument. Prof. Lodge is disposed to agree, for he finds that the resistance of almost any form of coherer varies in rough proportion to the received impulses, and there are other peculiarities; he is therefore inclined to think that the action cannot after all be entirely explained as due to mere "welding," but that there is something more to be learned about it. The sensitiveness of a coherer depends upon the number of loose contacts; it is a maximum for a single contact, namely, for a needle point lightly touching a steel spring. With this sensitive coherer, hardly any "tapping back" is required for decoherence, but it wants delicate treatment when properly adjusted, and the greatest current through it should not approach a milliamperé. On the other hand a Branly tube rather improves under rough treatment; in such a tube Dr. Lodge prefers to use iron filings in the best possible vacuum; brass, too, is very good, but rather less easy to manage. Aluminum is thoroughly bad, and gold, for the opposite reason will not work, its surface is too clean. Points, or small surfaces for making contact with the filings, are better than the large surfaces. The usual method of connecting the coherer across the gap of an ordinary Hertz receiver, in parallel with the telegraph instrument and battery, has the unavoidable objection that they shunt away part of the received oscillations. With the syntonio receiver of Prof. Lodge, which contains no gap, but a closed wire coil instead, the difficulty no longer exists; for the coherer can now be in series with the detecting instrument, and in so far as these obstruct the oscillations, they may be shunted out in various ways. The main feature of Lodge's new syntonized vibrators is this self-inductance coil, whose function it is to prolong the duration of the oscillations, and thereby to render syntonio possible. Prof. Lodge has designed a revolving commutator by means of which the coherer can be rapidly changed over from the resonating circuit to the instrument circuit, and finally to the tapping back apparatus. A coherer is more sensitive when thus isolated and exposed to the full influence of the received oscillations; the subsequent detection of the effect by altered connections is very convenient for laboratory measurements.

The Next Meeting of the N. E. L. Association.

Mr. Geo. F. Porter, Secretary of the National Electric Light Association, advises us that the next meeting of the Association will be held in Chicago, June 7, 8 and 9 next, with headquarters at the Auditorium Hotel. The rates for accommodation at the hotel will be from \$3.50 to \$5 per day on the American plan, or \$2 to \$4 on the European plan. The hotel managers give the Association the use of their banquet hall for the meetings.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

STREET RAILWAYS IN MASSACHUSETTS.

The Bay State has a very enviable record in the matter of railroad legislation. Massachusetts not only took the lead among American commonwealths in establishing a State Railroad Commission, but has consistently pursued a policy in regard to what shall and what should not be exacted of that class of corporations which might well be copied with advantage to public interests and to capital by other States. At the same time, the Massachusetts Railroad Commission has, through the quality of the men who have composed it and the character of its work and reports, thrown more light upon the railroad problems of the age than any other body in the country. The same may be said of the special work which Massachusetts has accomplished in connection with transportation matters in general, and this applies with particular force to the work of the special committee appointed by the Legislature last year to report upon the relations between municipalities and street railway companies. This commission was composed of such experts as Hon. Charles Francis Adams, Hon. W. W. Crapo and Mr. E. B. Haynes. After an investigation which extended to all features of the problem, not only as it existed in the State and the country at large, but in Europe, this committee's report has just been issued, and it is not going too far to say that it constitutes the most valuable and exhaustive examination of the subject that has ever appeared.

Within a comparatively short period the street railway has thrust itself forward in a new form and presents exceedingly important and interesting developments. The introduction of electrical power and the discovery that the providing of increased facilities for communication, not only in towns and cities, but in purely suburban and rural districts, tended to develop an enormous traffic has virtually created within a short time a new industry and new outlet for vast amounts of capital.

In a great many States and municipalities the question of franchises and the respective rights and duties of the companies and of the State or city have been treated in a haphazard way. The legislation of Massachusetts dealing with this subject was perhaps somewhat better than that of many other States, but even it has not escaped from the mistakes and complications which arise after entirely new conditions are dealt with by the light of antique ideas. In some respects the report of the commission is not applicable to the circumstances which exist in this connection in other States, but there are some in which its conclusions will receive great attention, and it, moreover, is calculated to give a direction to further legislation upon the entire subject of street railroads.

One of the most important of these relates to the limitation of dividends upon the stocks of street railway companies. The committee's recommendation is that if dividends in excess of 8 per cent. are paid upon the stock of such companies, a sum equal to the excess should be paid to the State to be distributed among the towns in which the companies operate their tracks. This touches a very critical point in the entire question. The municipalities, in Massachusetts at least, seem to consider 6 per cent. a proper limitation, while capital is naturally clamorous for no limitation at all. Looked at from an unprejudiced standpoint it would certainly appear that some limitation would be salutary in effect, if for no other reason than to curb the propensity to stock watering, so common in connection with corporations of this kind, and for examples of which it is not necessary to go very far afield. Another recommendation of the committee for a tax upon gross earnings of street railways payable to the towns for paving, clearing snow, etc., bears upon a subject which has at most been imperfectly met in various communities and which has occasioned a great deal of trouble in many of them. There is no question that uniformity in this respect would be attended by satisfactory results and would end the divided re-

responsibility between the corporations and municipalities, the unfavorable effects of which can be seen in many places.

The final conclusions of the committee relating to the ownership of tracks and their operation, either directly or through leases to companies, opens up a wide opportunity for discussion. The evil of political control is not disregarded, yet the committee, after considering all the principles involved, is forced to condemn a more or less ill-regulated private ownership and is forced to conclude that experience, both here and abroad, points to the advantage of a middle course, involving municipal ownership of the permanent way of such roads with operation by private companies. The report contains many important and interesting features, even those propositions which relate to questions of taxation peculiar to Massachusetts being well worthy of detailed examination. It is a document which is entitled to a wide circulation, and which, however its details may be inapplicable to street railway conditions in other States, may be deemed the best elucidation that has yet appeared of this subject.—*Bradstreet's*, Feb. 26.

American Institute of Electrical Engineers.

The 123d Meeting of the Institute was held at 12 West 31st street, New York, on Wednesday evening last, and was called to order by President Crooker at 8:30. About seventy-five members and guests were present. A paper on "The Single Phase Induction Motor" was read by Mr. Steinmetz and was discussed by Prof. W. S. Franklin, Dr. A. E. Kennelly, Messrs. E. E. Ries, Townsend Wolcott and others.

At the meeting of the executive committee in the afternoon the following associate members were elected:

Frank Broili, electrical engineer, California Electrical Works, San Francisco, Cal.

Samuel Byington Lobby, superintendent N. Y. & S. I. Electric Company, West New Brighton, N. Y.

Otto T. Louis, manager of New York branch Queen & Co., Inc., New York City.

James A. Mortland, Prof. of Physics, Faculty State Normal School, Cedar Falls, Iowa.

Chas. H. Schum, electrical engineer, Ideal Electric Corporation, New York City.

C. E. Sedgwick, agent at San Francisco office, General Electric Company, Berkeley, Cal.

Joint International Meeting at Laredo, Texas.

Mr. W. E. Holmes, secretary of the Texas Gas & Electric Light Association, has sent us the following particulars in regard to the transportation arrangements, etc., for the approaching joint meeting at Laredo of the Texas Gas & Electric Light Association, the Texas Street Railway Association and Mexican gas, electric and street railway men:

Mr. Carl F. Drake, chairman Transportation Committee, reports having secured the following rates for the association's meetings at Laredo:

For the International meeting of the Gas, Electric Light and Street Railway Associations at Laredo, March 9th to 12th, the I. & G. N. Railway and connecting lines in Texas, New Mexico, Oklahoma, Arkansas and Louisiana will make rates based on the 167-mile distance plan as follows:

Less than 100 miles, \$3 for round trip.

100 to 167 miles, \$5 round trip.

Beyond 167 miles, 10c per mile each way added to the rate of \$5 for that distance.

(If you are 167 miles from Laredo it will cost you \$5 for round trip. If 200 miles, \$5.66 for round trip).

This is the lowest basis used for any organized meeting. Visitors, as well as members of the Associations, can take advantage of this rate, and it is expected that the attendance will be large.

Tickets will be good for eight or ten days. Return limit may be extended at Laredo for those who wish to visit the interior of Mexico. Ask local ticket agent for selling dates, return limit and connections for Laredo.

All are urged to be prompt in attendance at opening session at 10 A. M., Wednesday, March 9.

Members who expect to take their wives to the Laredo meeting should advise Mr. C. F. Yaeger, Laredo, Texas, at an early date, in order that pleasant hotel accommodations may be reserved for them. It is expected that hotel accommodations will be ample, but those applying early will have most desirable rooms reserved.

LEGAL NOTES.

The jury at La Crosse in the case of the White-house department store against the local Edison Electric Company failed to agree on a verdict after being out twenty hours. The case was a suit for \$54,000 damages by fire claimed to have been started by improper insulation.

The United States Court has appointed D. W. Flickwir receiver for the Roanoke Street Railway and the Roanoke Electric Light & Power Company of Roanoke, Va. Propositions had been made to consolidate the companies, and it is understood that the appointment of a receiver was made necessary in order to wind up the affairs of the concern before the consolidation scheme could be effected. Bills have passed both branches of the Virginia Legislature providing for the consolidation of the two companies.

In the case of Miss Regina Christy against the Northern Electric Light & Power Company, at Philadelphia, a verdict for \$1,500 was agreed upon. Miss Christy is only 19 years of age, and the tip of the umbrella which she carried came in contact with one of the defendant's light wires which was hung too low. She was so badly shocked that she has lost the entire use of her right hand.

The sheriff has taken charge of the office at 11 Broadway, New York, of the Puritan Electric Company on executions aggregating \$3,663, in favor of the Manhattan General Construction Company, on notes. The Puritan Electric Company was incorporated in October, 1896, with a capital stock of \$100,000, and manufactured arc lamps. Stuart W. Wise was president, and the concern was regarded by the trade as an adjunct of the Manhattan General Construction Company.

The United States Court of Appeals for the First District, Boston, on the 18th ult., handed down a decision sustaining all claims of the electric heating patent taken out by James F. McElroy, of the Consolidated Car Heating Company. This is not the same decision given last summer, but affirms the one rendered by Judge Putnam in that circuit on August 25 last. The decisions make the American Electric Heating Corporation of Boston, Mass., who furnished these heaters, infringers, together with the West End Street Railroad of Boston, against whom the suit was brought. The court grants an injunction against the further manufacture of these heaters by the Boston company, and also orders an accounting. This is the third suit terminated in favor of the Consolidated Company in its litigation with the American Electric Heating Corporation, and it is considered a final decision from which there is no appeal.

In the matter of the assignment of George T. Breakenridge, who dealt in electrical supplies on Broadway, Albany, the statement filed with the county clerk shows that the debts and liabilities amount to \$8,555.86 and the assets nominally amount to \$3,975.20.

The Fisher Electrical Manufacturing Company of Detroit has given George W. Bates, trustee, a \$6,037.08 chattel mortgage for the Detroit Savings Bank, and C. H. Meday, president of the company, a \$21,266.93 second mortgage to secure him for loans and indorsements. The company was started eight years ago by Frank E. Fisher, but has succumbed to the hard times and closed down two weeks ago. H. H. Meday is vice-president, W. E. Reilly secretary, and Frank E. Fisher treasurer. The stock is principally owned by Mr. Fisher and the Medays. Mr. Fisher says it has been almost impossible to secure contracts at profitable figures. The company failed under the name of the Fisher Electric Company in 1893 and was reorganized.

An order was filed in the county clerk's office, New York, on the 19th ult., made by Judge Olcott of the City Court, vacating the appointment of W. H. Shepard as receiver in supplementary proceedings for Frank W. Hawley, vice president of the Cataract General Electric Company, and directing Mr. Shepard to transfer to John M. Shedd, the receiver appointed by Justice Bischoff of the Supreme Court, all money and property which may have come into his hands belonging to Mr. Hawley. Mr. Shedd is now the sole receiver. Mr. Hawley, it will be remembered, was an enthusiastic advocate of the application of electricity to canal boat propulsion, and was the leading spirit in the tests that were made at Tonawanda in 1895.

THE NEWS.

What Is Going On in the Electrical World.

STREET RAILROADS.

Boston, Mass.—The street railway committee of the Legislature have under consideration the petitions of several electric railway companies for permission to do an express and freight business. There is a feeling in the committee that the progress of the times demand that larger powers be given to street railways in regard to the carrying of packages.

Buffalo, N. Y.—Work on the roadbed for the new Buffalo, Hamburg & Aurora Electric Street Railway is being done rapidly. The company has decided to place in its power house machinery which will give 1,400 instead of 500 horse power, the latter amount being originally planned.

Charleston, S. C.—The Charleston & Seashore Railroad Company has been chartered by the Legislature. The capital stock is \$400,000. The line will connect Charleston with Mt. Pleasant, Sullivan's Island and Long Island, to be called hereafter the Isle of Palms. The road will be operated by electric power and will be constructed in the most substantial and improved style, and be supplied with the most modern equipment.

Denver, Col.—An ordinance has been introduced in the city council authorizing the Denver City Cable Company to change its system from cable to the electric trolley.—An ordinance has been published in the local papers granting a twenty-year franchise to the Denver City Railroad Company for an electric car line in specified streets in Denver. The company is permitted to use any electric system, and to change from one system to another at any time during the existence of the rights granted that shall to it seem to the best interests of the public.

East St. Louis, Ill.—A number of East St. Louis and St. Clair county capitalists have organized a company for the purpose of building an electric line from East St. Louis to Collinsville, and possibly to Edwardsville, in Madison county. The incorporators are Albert Drummond, W. Drummond, Henry Drummond, W. L. Johnson, W. E. Hadley, T. E. Raine, William Ortger and John Schmidt. A large section of the right of way has already been secured.

Eldora, Ia.—The Patton street car motor is attracting much attention in this part of Iowa on account of its successful operation. A new street car line between Eldora and Waterloo, thence south to Nevada and Des Moines, is to be equipped with it. The new line will be utilized for freight as well as passengers.

Hamilton, O.—At the annual meeting of the stockholders of the Cincinnati & Miami Valley Traction Company, held here on the 17th ult., Judge Dennis Dwyer of Dayton, Britt Brown of Dayton, Isaac Silverman of Philadelphia, Max May of Cincinnati and Joseph Sutro of New York were elected directors for the coming year. The board organized by the choice of Judge Dwyer, president; W. P. Schwab, secretary, and Isaac Silverman, treasurer. The most important transaction of the session was the leasing of the Dayton & Miami Valley Traction line, making complete connections by this company between Hamilton and Dayton.

Menominee, Mich.—The car barns of the Menominee Electric Light, Street Railway & Power Company were burned last week. Five motor cars and five trailers were destroyed. Total loss, \$35,000.

Port Huron, Mich.—The St. Clair Tunnel Company is contemplating converting the motive power for the tunnel from steam to electricity. Ever since the awful casualty of November 28 the officers of the tunnel company have given the subject of electrical propulsion considerable attention, and they have now about decided to equip the tunnel with electrical power at as early a date as practicable.

Reading, Pa.—The directors of the Mount Penn Gravity Railroad Company have decided to equip their system electrically for the purpose of reducing expenses. It has been necessary to maintain several engines for the running of trains to the summit of Mount Penn, the return trip being made by gravity. Under the new system the engines will be dispensed with, although the descent from the summit will be by gravity as heretofore. The power will be furnished by the Reading Traction Company.

Rensselaer, N. Y.—The stockholders of the Greenbush & Nassau Electric Railway at a meeting held here on the 22d ult. adopted resolutions the purport of which was the pushing of work to complete the road. The following board of directors was elected: William O. Barnes, Fred Carr, Thomas D. James, Jared L. R. Davis, George Whitbeck, Gardner Morcy, Sylvanus C. Curran, Lewis Miller, John Garrison, Joel Morcy, Thomas W. Cantwell, W. Cochen, William Nichols, Warren Fowler, Edwin S. Comstock. The directors elected the following officers: President, W. D. Barnes; treasurer, Thomas W. Cantwell; secretary, Dr. S. C. Curran; superintendent, Fred Carr.

Richmond, Va.—A proposition that is receiving attention here is to run an electric road from Richmond to New Ferry. Such a road would, it is thought, do a large passenger business, as the route lies through the battlefields of Cold Harbor, Beulah Church and Gaines' Mills and runs directly by Cold Harbor National Cemetery. The road would also run through the center of the great trucking interests of Hanover, and reach at New Castle Ferry, on the

Pamunkey River, some of the richest grain and grass lands in Eastern Virginia. Grain, wood, lumber, feed and all kinds of freight would be lightened up and down the river to the road, to be taken to Richmond, and thence to other markets.—The franchise granted the Home Electric Company has been nullified by the failure of the company to deposit the \$5,000 guarantee. The Southern Electric Company, to whom a similar franchise was granted by the council at the same time as that of the Home, met this obligation in due time.

San Francisco, Cal.—The Market Street Railway is to be changed into an electric line.—A dispatch from Stockton to the "Chronicle" states that power from the Blue Lakes electric plant will be conveyed to San Francisco, a distance of 140 miles. A company with unlimited capital has been formed and will commence operations at once. Surveys have been made in San Joaquin and Calaveras counties, and it is stated by the attorney of the company that T. S. Bullock, who is at the head of the corporation, would begin work in a few days after the franchises along the county roads were granted, as the capital was in the bank to carry out the project. The line will pass through Bellota, Linden, skirt Stockton, cross the reclamation districts, touch Antioch and Martinez, and reach San Francisco by cable under the bay. The company will furnish power and light to all the towns through which it passes. The big pumps on the reclamation districts will be run by electricity, and light will be furnished San Francisco.

LIGHTING PLANTS.

Albany, N. Y.—A bill has been introduced in both houses of the General Assembly authorizing municipal officers of cities whose population does not exceed 50,000 to contract for the lighting of streets for a period not to exceed five years.

Athens, Tenn.—Long Bros. of the Athens Roller Mills has made a proposition to the mayor and council to furnish electric lights for the city, and the probability is that it will be accepted.

Baltimore, Md.—The Northern Electric Company, successor of the United States Electric Lighting Company in this city, is making extensive additions to the old plant which are being rapidly pushed. New and more powerful generating machinery will be introduced and the accommodations will be considerably increased by additions to the present buildings and the erection of a new boiler house.

Elgin, Texas.—Present indications are that Elgin will have an electric light plant in the near future, as parties are figuring on cost and maintenance of the same.

Fort Smith, Ark.—The board of public affairs of this city will receive bids up to and including March 5 for the lighting of the city with at least 70 arc lights of 2,000 cp. for a period of ten years from July 15, 1898. Bids will be received for electric lighting alone or for electric lighting in conjunction with building and equipping six miles of electric street railway within one year from July 15, 1898, or for both.

Gladbrook, Ia.—There is a growing agitation here in favor of putting in electric lights.

Hartford City, Ind.—The Panhandle Railroad Company is experimenting here with electricity in its semaphore signal lights, and if successful it will in all probability supplant the oil which has been in use since railroading was first known. Railroaders here say the electric signal semaphores can be seen at a far greater distance than those using oil. The success of the experiment is being watched with interest in railroad circles.

Hartwell, O.—Proposals for lighting this village by electricity will be received by the village clerk, T. H. Murpe, until March 17. Bids should be for not less than forty arc lights of two thousand candle power each and twenty incandescent lamps of thirty-two candle power each, and should specify the price per lamp at which light will be furnished, this price to include any additional lamps that may be required during the term of contract, which will be for ten years.

Lyons, Mich.—The common council is investigating the cost of an electric lighting plant with the idea of putting in one to be operated under municipal control.

Markham, Ont.—The waterworks and electric light plants were almost completely destroyed by fire on the 16th ult. The electric plant was owned by W. J. Fletcher of Alliston, and was not insured.

Neola, Ia.—At the special election held here to vote on an issue of bonds to put in electric lights, the affirmative vote was 169 to 32 against. The bonds will be issued at once and a plant erected.

Newton, Kan.—The "Republican" says: "The Rock Island Railroad Company is preparing to spring an innovation by the adoption of electric lights for its engines. Before long all the locomotives of the through trains will be equipped with electric headlights and the old-fashioned lamps will be discarded."

Richmond, Mich.—Another vote will probably be taken this spring on the question of bonding the village for electric lights.

Saugatuck, Mich.—The city council has granted a franchise to the Saugatuck, Douglas & Lake Shore Electric Railway Company. The road will connect with the electric road being built from Holland to Macatawa Park and is to be completed this season.

St. Louis.—The plant of the Ferguson Olive Branch

Electric Light & Power Company will be sold at auction March 10.

Thomaston, Ga.—A committee of three aldermen has been appointed by the mayor to confer with an electric company toward erecting a plant to supply electric lights.

LONG TRANSMISSION.

Hagerstown, Md.—Powell Evans, who sold his electric light plant in this city to officers of the Hagerstown Electric Railway Company, states that he did not sell the several miles of river bottom from Weverton to the Frederick county line, and that he intended himself to develop the project of furnishing power to Hagerstown and other towns by building an immense dam across the Potomac. He also stated that when his plant was in operation he expected to supply power on such a scale that he would be enabled to furnish the Hagerstown electric railway with enough to run its cars and light Hagerstown. Mr. Evans has just been granted by the Virginia Legislature the privilege of furnishing power south of the Potomac.

Knoxville, Tenn.—It is stated that the Knoxville Water & Electric Power Company expects to begin work on its dam and power house at an early day. The company proposes to build a dam on the Holston River about 4½ miles above its confluence with the French Broad, and erect electric generating works there the product of which will be transmitted to Knoxville for lighting and power purposes. Horace Van Deventer of Knoxville is the secretary and treasurer of the company.

Provo City, Utah.—On the 15th ult., says the Provo "Enquirer," "the wheels of the Telluride Power Transmission Company were set in motion, and the electric current flashed over the wires from Provo canyon to Mercur, a distance of thirty-five miles, the longest distance which power is continuously transmitted over wire in the United States, and only 8 per cent. of the power is lost after traveling that distance. The machinery will be kept in continual motion now."

St. Louis.—A company is forming in this city for the purpose of harnessing the water power of the Meramec River near Pacific, Mo., and building at that point a plant which will be sufficiently powerful to distribute light and power not only throughout the county and towns between St. Louis and Pacific, but to users of electricity in this city.

MINES.

Cumberland, Md.—The Davis Coal & Coke Company, at Thomas, W. Va., has completed its electric plant, and hereafter the yards and mines will be illuminated by electricity and coal will be mined and hauled to the surface by electric power.

Mammoth, W. Va.—C. C. Lewis is having a large electric power plant constructed. He has undertaken to furnish electric power to the mines of the Staunton Coal Company, the Thomas Sholz Company and the Kelly's Creek Coal Company. This plant, which is to cost about \$20,000, is being put in by a Chicago electrical company.

MANUFACTURING, ETC.

Cincinnati.—The Bullock Electric Manufacturing Company has decided to accept a site at Norwood for its new plant. A twelve-acre tract has been obtained which is conveniently located at the intersection of the Baltimore & Ohio and Cincinnati, Lebanon and Northern Railroads, and here will be erected a machine shop, brass foundry, power house and office buildings. The company, it is stated, will spend at least \$150,000 on buildings and machinery.

Omaha, Neb.—Thirteen car loads of electrical equipments brought from the Nashville Exposition have reached here and men have been set to work putting in the whole plant for the illumination of the Exposition grounds.

Pittsburg, Pa.—The "Times" states that "contracts have been received by the Westinghouse Electric & Manufacturing Company from the Campanhia Mineira de Electricidade, a company which controls extensive light and power concessions in Brazil, for the complete equipment of two big power plants erected by the company. Other contracts are promised from the great republic, as a wonderful activity in the establishment of electric plants has been shown."

Washington, D. C.—The District Commissioners have decided that under the law hotel power plants can no longer furnish service to other buildings.

COMPANY MATTERS.

Akron, O.—A deal has been closed whereby the Akron, Bedford & Cleveland and the Cleveland, Painesville & Eastern Electric Railway Companies are consolidated under one management in the operating department so as to secure harmony in connections. The following officers have been appointed to operate the consolidated roads: Superintendent, L. E. Beinstein; general passenger agent, Julius Mengensdorf; park superintendent, C. T. Bates. H. A. Everett, who was president of both companies, will be at the head of the consolidation.

Annapolis, Md.—A bill has been introduced in the House to incorporate the National Park, Silver Spring & Hyattsville Railroad Company, the capital stock to be not less than \$50,000 and subject to an increase to

\$100,000 by a vote of the stockholders. The incorporators named are Francis H. Smith, J. H. Raleton and Roger Bellis, of Prince George's County; B. G. Smith of Conowingo, Md.; Richard Martin, Jr., of Baltimore; Lewis H. Finney and John C. Davidson of Washington; John Leeds Bowie and H. Bradley Davidson of Montgomery County, Md.

Columbus, O.—The Columbus Electric Company, formerly the Columbus Electric Light & Power Company, organized on the 21st ult. by electing A. P. Lathrop president and treasurer; George W. Bright first vice-president, and W. S. Kelly second vice-president and consulting engineer. The other directors are: Fred W. Hubbard, L. P. Stevens, S. J. McClure, Thomas E. Knauss and W. H. Doane. The property will be put in first-class shape as regards power house, lamps and lines.

Knoxville, Tenn.—The city council has passed an ordinance authorizing the Knoxville Electric Light & Power Company to purchase, lease or consolidate, with the Mutual Light & Power Company.

Pittsburg, Kan.—The stockholders of the Pittsburg, Fontenac & Suburban Railway and the Weir City, Pittsburg & Columbus Electric Street Railway at a meeting in this city elected reorganization, in which the control of the line passes into the hands of Pittsburg men. The resignation of Leroy Simons, general superintendent, was accepted, and F. B. Wheeler, J. A. Gibson, M. O. Dick and Morris Cliggett of this city and Joseph Anderson, J. J. Tyler and Dr. Jones of West Chester, Pa., were chosen directors. Morris Cliggett was elected president. The line is now in a prosperous condition, and the new management will proceed at once with the extension of the road to Weir City and Columbus.

Valatie, N. Y.—The Columbia Electric Power Company has filed a certificate stating that its capital stock has now been all paid in. Its directors include Charles Wild, William H. Wild and George M. Pinney.

PERSONAL AND MISCELLANEA.

C. E. Scribner, the electrical inventor, of Chicago, and Herman Salt of the Western Electric Company, New York, were in New Orleans on the 22d ult., on their way—not to Cuba, but to Mexico.

The electrical engineers of St. Paul and Minneapolis, to the number of thirty-five, partook of their second annual banquet at the Windsor Hotel in St. Paul on the 21st ult. Morgan Brooks of Minneapolis presided and among the speakers was Prof. George D. Shephardson, who spoke for the electrical engineering department of the State. He suggested among other things a larger union among men of the craft through membership in the Association of Engineering Societies, which now carries on its rolls 1,200 names.

W. H. Milholland, secretary of the Citizens' Street Railroad Company, Indianapolis, has received the following letter, written by Walter W. Brown of that city. It speaks for itself: "Gentlemen—Some years ago, three or four, at different times, I neglected or rather refused to pay my fare by letting the conductor pass me by, when, if I had acted honestly, I would have paid him. One time I got off the car before he got to me, but when he called to me for fare I did not pay, because another conductor had made me pay for two squares when I had to get off a moment to see a man and take the next car. That was not his fault, however. I at another time lost my fare and the conductor let me ride home anyway. So I inclose you stamps to cover all that I think I ever got from your company in that way. I am now a child of God, and I see in His Word that we have all got to stand before Him and be judged—street car company and all—and I do want to be unblamable in holiness, without which no man can see God, before God, even our Father, at the coming of our Lord Jesus Christ with all His saints. Accept inclosed. Forgive my wrongs. Meet me at His coming with a pure heart." There was 30 cents in stamps in the letter.

Frank Renehan, of Washington, D. C., left Santa Fe, N. M., a few days ago for Bland, where he has been employed as electrician by the Bland Milling Company. This company is installing a complete electric plant for the recovery of gold and other metals by a new process, the invention of W. B. McPherson of San Francisco. Under this system gold, silver and copper are chemically dissolved and subsequently precipitated by an electric current. It is said that as a result of the process the gold gathers in one receptacle, the silver in another and the copper in a third. Much interest is manifested in the success of the plan which will revolutionize old methods.

S. F. Hazelrigg, general manager of the Atlantic Coast Electric Railway Company, who recently returned from an extended trip through Europe and South America, has been made manager of the Staten Island Rapid Transit Company and the Staten Island Electric Light Company. He was appointed on February 1, and has assumed full charge of the workings of the two companies. In addition to these positions, Mr. Hazelrigg will continue as general manager of the Atlantic Coast Company, with a residence in Asbury Park, N. J.

Howard Gould's new yacht, the Niagara, built by the Harlan & Hollingsworth Company, Wilmington, Del., will have an electric plant as complete as has ever been installed on board a ship. It will consist of two dynamos, each capable of furnishing 400 sixteen-candle power lamps, and a storage battery with a capacity of eighty lamps. When desired the dynamos can be made to operate 900 display lights at night, and also a powerful searchlight on the bridge. Electricity will be employed

in every conceivable way on board the Niagara. There will be electric heaters, curling tongs, smoothing irons, ranges, warming pans and lifts. Electricity will operate the laundry and drying rooms; it will heat chafing dishes and bring out the music of the big orchestra. The ship will be electrically heated throughout.

RECENT COMPANY ELECTIONS.

Belvidere Electric Light Company, Belvidere, Ill.—President, F. W. Plane; vice-president, M. C. Marian; manager, D. B. Pettit; secretary, J. R. Balliet; treasurer, Beecher Sands.

Cohoes City Railway Company, Cohoes, N. Y.—Directors: Robert O. Pruyn, Edgar S. Fassett, George S. Turner and Thomas I. Van Antwerp.

Consolidated Railway Company, Baltimore.—Directors: Nelson Perin, Charles Adler, E. L. Bartlett, H. Crawford Black, William T. Dixon, T. Edward Hambleton, William P. Harvey, Jesse Hilles, William A. House, George O. Jenkins, George A. Von Lingen and Theodore F. Wilcox. President Nelson Perin, Vice-President and General Manager W. A. House and the other officers were re-elected.

Fulton Electric Light & Power Company, Fulton, Ill.—President, Mrs. Mary R. Lockheart; vice-president, Dr. D. W. Ward; treasurer, Edmund Jackson; secretary and manager, John C. Martindale; electrician, George A. Walter.

Lansoning Electric Light & Power Company, Lansoning, Md.—President, William Atkinson; secretary-treasurer, Hugh Scott; directors: Wm. Atkinson, Hugh Scott, George Schantz, Jr., John McFarlane, Sr., and George Tennant.

Louisville City Railway Company, Louisville, Ky.—President, J. B. Speed; vice-president, St. John Boyle; general manager, T. J. Minary; secretary, J. M. Pettus; directors: J. B. Speed, H. H. Littell, St. John Boyle, A. P. Humphrey, John States, J. W. Gaubert, Harry Bishop, T. J. Minary and A. H. Davis.

Waterford & Cohoes Railway Company, Cohoes, N. Y.—Directors: Thomas Bresline, Thomas Knickerbocker, Charles Clemenshaw, William Kent, Otis G. Clark, William Shaw, Francis N. Mann, Jr., Frank Peck, C. C. Ormsby, J. J. Hagen.

Madison Electric Railway Company, Madison, Wis. (reorganization).—President, F. W. Oakley, Madison; vice-president, George S. Russell, Cleveland; secretary and

The Brake in Railway Service.

This is the age of high speeds for nearly every class of railroad service, both steam and electric. Many are the devices for applying the brakes to the wheels, but it has remained for J. Hector Graham, General Manager of the Graham Equipment Company, to perfect his Brake Equalizing Bar to which the brake beams of the trucks are hung, and which effectually prevents all tilting of the truck frame and the disagreeable backlash of the car body when a sudden application of the brakes is made with a full load. (See cut of truck.)

Many people have been thrown from electric cars and seriously injured by the brakes being applied and then suddenly released when the car was moving at a high rate of speed. The sudden application tilts the truck frame and the sudden release gives a tremendous rebound to the car body. All this Graham's Equalizer overcomes. On nearly every steam and electric car truck, no matter what service it is in, the brake beams are supported from the truck and sills by a wrought iron link made of $\frac{3}{4}$ inch half round iron. This is fastened in an iron clip to the truck end sills and in the cast-iron brake head. The constant vibration of the truck, with the many applications of the shoes to the wheels, wears the contact parts of link, clip and brake head, so that in time when the brakes are applied the shoes slip up and down on the wheels causing a clatter and hammering, greatly annoying the passengers.

Graham has discarded these old-fashioned brakes, and uses a $\frac{3}{8}$ inch round steel rod with flexible rubber cushions, entirely preventing all clatter and reducing the locking of the wheels to a minimum. (See cut of truck.)

Again, with the present method of hanging the brake beams from the track sills, when the car is loaded the shoes are carried down under the wheels, lengthening out the brake rods and requiring more turns of the brake handle or more piston travel of the air cylinder to make a stop. Graham's Equalizer carries the shoes up an inch on the wheels for every inch the load deflects the truck frame, so that when a car is loaded it is much easier to stop the car than when empty.

The Brake Equalizer can be applied to all makes of

business for all there is in it, and judging from the excellent quality of the goods he is now turning out, his lamps cannot help but become popular and create a large demand.

Any one desirous of obtaining electrical measuring instruments would do well to address the Cherry Electric Works, 25 and 27 Third Avenue, New York. This concern has recently placed upon the market an inexpensive but accurate voltmeter reading from 0 to 10 volts and an ammeter reading from 0 to 10 amperes. The price of these instruments is but \$1.50 each, and for experimental purposes,

CHERRY'S VOLTMETER.

where the standard instruments would prove too expensive, these will be found both valuable and trustworthy. The mechanism is enclosed in a hardwood case, which gives them an extremely neat and handsome appearance. There is no doubt but what these instruments fill a long-felt want, as many amateurs have been kept from experimenting owing to the cost of the standard instruments.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address: Sterling Remedy Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

INCORPORATIONS.

The Sonoma Electric Light Company, Sonoma, Cal. Capital stock, \$10,000; subscribed, \$3,250.

The Meyersdale Electric Light, Heat & Power Company, Meyersdale, Pa. Capital stock, \$10,000.

The La Salle County Railway Company, Streator, Ill. Capital stock, \$500,000. Incorporators: W. H. Boys and W. H. Holcomb.

The American Motor Syndicate, Chicago. Capital stock, \$2,400. Incorporators: Theron E. Dixon, D. H. Fletcher and J. S. McGregor.

The bill providing a charter for the Consolidated Railway & Electric Power Company of Roanoke, Va., has passed the Virginia Senate.

The Belmont Gas & Electric Fixture Manufacturing Company, Belmont, Ill. Capital stock, \$2,500. Incorporators: S. H. Ales and Richard E. Burke.

The Merced Falls Electric Company, Merced, Cal. Capital stock, \$100,000. Incorporators: James G. Ruddle, E. D. N. Lehe, James T. Peck, J. D. Bradley and O. E. Green.

The Flushing Electric Light & Power Company, Flushing, N. Y., has certified to an increase of capital stock from \$100,000 to \$250,000. The liabilities of the corporation are \$151,159.

The Muncie Electric Light Company, Muncie, Ind. Capital stock, \$25,000. Directors: Charles H. Kembrough, William H. Wood, H. Clay Haymond, Melville Wood and Hal C. Kembrough.

The Ward Leonard Electric Company, Bronxville, N. Y., to manufacture electrical appliances. Capital stock, \$100,000. Incorporators: H. Ward Leonard, Charles E. Carpenter, Richard H. Mansfield, Jr., and Henry P. Bull.

The Borough of Brooklyn Gas Company, Brooklyn, N. Y., to manufacture and sell gas for lighting purposes and to manufacture and use electricity for producing light, heat and power. Capital stock, \$500,000. Directors: Samuel B. Lawrence, Francis P. Lowrey and Armitage Mathew, of New York, and Henry M. Haviland and John E. Summerfield, of Brooklyn.

The Warren-Medbery Company, Sandy Hill, N. Y., to manufacture electrical supplies. Capital stock, \$25,000. Directors: Horace J. Medbery and S. C. Medbery, of Ballston Spa; H. B. Warren, of Yonkers, and W. H. Cunningham, H. E. Tidmarsh, Lincoln Paris and G. W. Wait, of Sandy Hill. The officers are: President, H. J. Medbery; secretary and treasurer, George W. Wait; general manager, H. E. Tidmarsh. The special dynamo to be made is the invention of Mr. Warren, and generates incandescent and arc currents.

The Sherwood Car Fender Company has been incorporated at Trenton, N. J., with a capital stock of \$400,000, all paid in. It is to manufacture car fenders and other car ap-

GRAHAM ROLLED STEEL TRUCK.

treasurer, H. R. Newcomb, Cleveland; directors: the president, vice-president and treasurer; T. H. Wilson, Cleveland; P. L. Spooner and J. H. Palmer, Madison; S. M. Hammell, Schenectady, N. Y.

COMMERCIAL PARAGRAPHS.

The Ward Leonard Electric Company, Bronxville, N. Y., advise us that the circuit breaker business has grown to such dimensions that they have been obliged to make tools for all the different operations and have perfected them to such a degree that all the parts are interchangeable and any part can be replaced or duplicated out of stock at once.

Mr. W. J. Wollman, a well-known member of the Chicago Stock Exchange, begs to announce that he has moved permanently to New York and has opened an office at 20 Broad street, where he is prepared to carry on a general brokerage business. Mr. Wollman's success in Chicago is a guarantee that any prospective investors who purchase securities through him will be well treated.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

The Eureka Tempered Copper Company, since the removal of their New York offices from 511 and 513 West 13th street to more spacious quarters at 107 Liberty street, are doing a brisk business, their product being especially desirable for commuters, commuter segments, bearings of all kinds, and in fact for all devices in which pure copper without alloys, but sufficiently tempered for all mechanical purposes, is wanted. This is probably the only firm that can supply tempered copper at such a reasonable price as to bring it within the reach of all.

truck, both steam and electric, and in view of the crude methods now in operation it would be well for all builders of electric trucks to write to the Graham Equipment Company, Boston Mass., for terms, as they are ready to license any company to apply it to their trucks.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

"Shade Lamps" is the title of a very dainty little catalogue just issued by the Electric Appliance Company, Chicago, covering their special lines of Esperen, Klemm and Dale electric portables and shade lamps. It is a valuable catalogue for any user or dealer in these goods and will be sent on application.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

Although the Edison Junior "Improved" Incandescent Lamps have only been on the market a comparatively short time, large quantities of them are being sold, and at the general offices of Mr. Thomas A. Edison, Jr., 96 Broadway, New York, business is reported as being exceedingly brisk. These lamps, the filaments of which are made by a new process, are manufactured at Shelby, Ohio, and can be obtained of almost any desired color. Mr. Edison, Jr., now has branch offices established at 60 State street, Boston, at St. Paul, Minn., at Los Angeles, Cal., at Norfolk, Va., at Austin, Tex., and at Santiago de Cuba. It can readily be seen that Mr. Edison, Jr., is pushing the lamp

TELEPHONE AND TELEGRAPH.

pliances. The principal incorporators are Carl Sherwood and Judson J. Curtis of Honesdale, Pa., and Charles H. Bonner of Brooklyn, N. Y.

The Citizens' Electric Company, Eureka Springs, Ark.—to operate a plant or plants for electric light, heat, ice and power purposes. Capital stock, \$25,000. Incorporators: W. M. Duncan, A. R. Sayles and L. P. Badger.

The Standard Traction Company, Philadelphia. Capital stock, \$1,000. Incorporators: Maynard L. Young, Edwin F. Morse, William S. Doran, J. Howard Reber and William F. Sullivan.

The Columbus Electric Company, Columbus, O.—to supply electricity for power and for lighting the streets and public and private buildings of the city of Columbus and the territory contiguous thereto; manufacturing, selling and furnishing the electric light and power required therein for such purposes; constructing lines for conducting electricity for power, light and other purposes, and doing such other things as usually appertain to the business of electric companies. Capital stock, \$750,000. Incorporators: Irvin Butterworth, Walstein F. Douthirt, Chas. S. Ritter, Arthur R. Bliss and Irving M. Seleger.

The Wilmington & Chester Traction Company has filed articles of incorporation in the Camden County clerk's office, Camden, N. J. The objects of the corporation are to build, construct and operate electric railways. Capital stock, \$2,000,000; paid in, \$1,000. Incorporators: Henry C. Moore, Trenton; Henry A. McCarthy, Ridley Park; Richard Nichols, Germantown, Pa.; Clarence Sill, Darby, and Charles Martindale, Camden, N. J.

The Germantown & Fairmount Park Street Railway Company, Philadelphia— to build and operate a street railway. Capital stock, \$80,000. Incorporators: Charles E. Morgan, W. Rotch Wister, William G. Warden, Josiah M. Bacon, Samuel T. Bodine, Richard Ashhurst, Joseph Bushnell, William Wharton, Jr.

The Bonanza Power & Land Company, Pocatello, Idaho—to improve lands by irrigation, operate mines and build an electric railroad from Shoshone to Great Shoshone falls. Capital stock, \$500,000. The incorporators are ex-Governor Rickards of Montana, ex-Lieutenant Governor Bierbover of Idaho, J. P. Parrine, owner of the celebrated Blue Lakes farm, Joseph Wildran of Shoshone, Idaho, and F. R. Thomas and J. J. Cusick of Butte.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 22, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 599,344. Electric-Railway System. John M. Murphy, Torrington, Conn., assignor, by direct and mesne assignments, to the Safety Third Rail Electric Company of New Jersey. Filed Sept. 24, 1897.
- 599,393. Trolley for Electric Railways. Edward K. Landis, Philadelphia, Pa. Filed March 5, 1897.
- 599,580. Switch-Operating Mechanism. Charles W. Yerbury, Newark, N. J. Filed Oct. 6, 1897.
- 599,604. Electric-Railway System. James D. Gibbs, Chicago, Ill. Filed March 14, 1896.
- 599,470. Car Fender. Inozens J. Neracher, Cleveland, O. Filed Sept. 12, 1896. Renewed July 6, 1897.
- 599,650. Safety-Guard for Railway-Cars. Abel M. Phelps, New York City. Original application filed Jan. 8, 1894. Renewed Nov. 26, 1895. Divided and this application filed April 21, 1894. Renewed Nov. 4, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 599,480. Electric Arc Lamp. Orville B. Skinner and Geo. M. Bacon, Cleveland, O., assignors of one-third to George G. Wells, same place. Filed Aug. 27, 1897.
- 599,519. Radiator Attachment for Arc-Lamps. Henry Stenz and George Westermann, Faribault, Minn., assignors to the Shadowless Radiator Manufacturing Company, same place. Filed Nov. 30, 1896.
- 599,543. Support for Incandescent Electric Lights. John Whitaker, Schenectady, N. Y. Filed June 19, 1897.
- 599,635. Electric Arc Lamp. Henry J. Sage, Rochester, Pa. Filed March 13, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

- 599,322. Individual Telephone Call. Thomas C. Drake, Malta, Ohio, assignor, by mesne assignments, of one-third to James M. Rusk, McConnellsville, Ohio. Filed July 2, 1894.
- 599,533. Telephone-Switchboard Apparatus. Cleveland F. Dunderdale, Chicago, Ill., assignor of one-half to John F. Pershing, same place. Filed July 31, 1896.

BATTERIES.

- 599,315. Secondary Battery. Walter A. Crowder, Chicago, Ill. Filed Jan. 25, 1897.
- 599,405. Electric Battery. Charles P. Shrewsbury, London, and John L. Dobell, Modbury, England. Filed Dec. 24, 1895.
- 599,411. Electrical Primary Battery. Joseph B. Whittemore, London, England. Filed Sept. 8, 1896.

MISCELLANEOUS.

- 599,316. Electric Igniter for Gas-Engines. Fitz E. Culver, Chicago, Ill. Filed Feb. 15, 1897.
- 599,316. Electric-Wire-Holding Appliance. Hugh A. McCoy, Cambridge, Mass. Filed Sept. 30, 1897.
- 599,351. Electric Resistance Conductor. Henry G. O'Neill, Brookline, Mass., assignor to the American Electric Heating Corporation, Boston, Mass. Filed Jan. 4, 1897.
- 599,352. Electric Resistance-Conductor. Henry G. O'Neill, Brookline, and Horace B. Gale, Boston, Mass., assignors to the American Electric Heating Corporation, Boston, Mass. Filed Jan. 4, 1897.
- 599,354. Electric Igniter for Explosive-Engines. Hubert F. Probst, Chicago, Ill. Filed April 8, 1897.
- 599,455. Apparatus for Producing Ozone. Marius Otto, Paris, France. Filed June 15, 1897.
- 599,508. Driving-Gear for Electric Motors. George A. LeFebvre, New York City. Filed April 21, 1897.
- 599,654. Fire-Alarm Box. John H. Hayes, Appleton, Wis., and Charles Fisher, Chicago, Ill. Filed Jan. 21, 1897.

DESIGN.

- 24,309. Meter-Case. William D. Marks, Philadelphia, Pa., assignor to the American Electric Meter Company, same place. Filed Nov. 27, 1896.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY.**

George H. Atkinson, lately manager of the Hudson Telephone Company, and a former manager of the Newark Telephone Company, was arrested in Jersey City on Wednesday night last week in civil proceedings brought by Robert Baker, of Brooklyn, to recover 550 shares of stock of the Newark Telephone Company. Baker alleges that in the latter part of March, 1896, he bought the stock from Atkinson at \$10 a share, and left it with him in trust, taking Atkinson's receipt for it, and that when he demanded the stock, which is now worth \$1,500, Atkinson refused to surrender it. Sheriff Heller held Atkinson in \$5,000 bail. Several other suits on various charges are pending against Atkinson.

The special committee on telephone service and charges of the Wholesale Grocers' Association of New Orleans have submitted their report. In it they say: "Your committee is clearly of the opinion that the present service is inferior for the price paid, and that the metallic or up-to-date circuit (designated as long-distance circuit) should have been furnished long since without extra cost, and under these circumstances the committee would recommend that every encouragement be given to a proper movement looking to improved service upon reasonable terms."

Senator Foster's bill in the New Jersey Senate limits telephone charges in first-class cities to \$1 per month, in second class cities to \$3 and in all other municipalities to \$2.50, and provides that the rate at public stations for local messages shall not exceed 10 cents for five minutes' talk. If these charges fail to net a company 8 per cent. net profit, it is provided to have an investigation made and to have charges regulated so as to yield that profit. The act makes provision for annual reports from the companies.

"It is rumored," says the Charleston, S. C., *News and Courier*, "that the network of telephone lines all over Marion and Marlboro counties in this State and some points in North Carolina will soon be extended to Cheraw. The gap between these lines and the Chesterfield line is only seven miles, and with the building of this and a little short one from Chesterfield to Movven connection will be completed from Charlotte to Wilmington, taking dozens of points in South Carolina."

At a mass-meeting of citizens held in the court house at Winchester, Tenn., a committee was appointed, consisting of F. A. Pattie, S. M. Alexander and George E. Banks, to investigate and report whether or not it was to the best interest of the town to organize a local telephone company or to encourage the East Tennessee or Cumberland Telephone Companies to establish an exchange in the town.

The Cumberland Telephone Company, having absorbed the Great Southern Telephone & Telegraph Company, will connect the Louisiana system of the Great Southern with its own, which covers not only Tennessee but a part of Kentucky, by building south from Memphis. The line of the Illinois Central Railroad will be followed. A new switchboard will be placed in the exchange at New Orleans and a much improved service in that city is promised.

It is stated that if the citizens should win their suit in Omaha against the Nebraska Telephone Company for reduction of tolls from \$5 to \$3, and the company should refuse to comply with the law, an Eastern syndicate stands ready to put in a telephone system in that city and furnish efficient service at the low rate.

The officers of the Buffalo Telephone Company, incorporated on the 19th ult., say they will begin operations just as soon as a franchise is secured in Buffalo. Application for the franchise has been made to the aldermen. This is the second telephone corporation organized in Buffalo within a few weeks, the Western New York Telephone Company being the other.

Edgar L. Miller of Frederick, Md., general manager of the Interstate Telephone & Telegraph Company, was at Wilmington, N. C., a few days ago arranging to carry out the plan of the company to place Wilmington in connection with its long distance circuit, connecting that city with Goldsboro, Raleigh, Durham and other cities.

The *Plaintdealer* of Wabash, Ind., states that nearly all the additional issue of the Home Telephone Company's stock, which it was proposed to issue to retire the outstanding obligations incurred on construction account, has been taken, and the \$5,000 in certificates will be issued in a few days.

The Keystone Telephone Company of Pittsburg, Pa., has proposed to the board of Trade of Latrobe, Pa., to remove its plant to the latter place for a cash bonus of \$10,000.

A telephone company has been organized by the citizens of Pathville, Franklin county, Pa. Their purpose is to

run a line from Richmond, Franklin county, to Blair's Mills, Juniata county, a distance of twenty-two miles.

The Lansing, Mich., telephone exchange has made connection with the Central Telephone Company's new metallic line between Grand Rapids and Chicago. Lansing will have connection with 13 county seats not now accessible. By spring the line will be extended to Fort Wayne.

Formal demand having been made by Senator Brush for immediate action by the Senate Finance Committee on the bill introduced by him for the New York Board of Trade, providing for a reduction in telephone rates, the committee met Thursday of the present week for a hearing on the bill.

The Colorado Telephone Company is erecting a new exchange at Denver, which will be fitted with all the modern improvements and will have a capacity for 2,100 subscribers. A reduction in rates is promised when the new station is completed. E. B. Field, the general manager, was recently made a director.

The District Commissioners at Washington, D. C., have decided to report favorably on the bill to authorize the Automatic Telephone Exchange Company, Limited, to install and operate a system of telephones in Washington. The bill has been introduced in the Senate.

Two new ordinances were introduced in the Chicago city council last week. One has for its object the establishing of long-distance telephone stations in conjunction with a Wisconsin long-distance company, and the other ostensibly provides a competitor for the Chicago Telephone Company.

The Railway Commission at Raleigh, N. C., on the 18th ult., after hearing the argument of Senator Daniel, counsel for the Bell Company, overruled the exceptions of the company to the order reducing telephone rates. The Bell Company gave notice of appeal.

At Fulton, N. Y., a new company has been organized to be known as the Fulton Telephone Company. The officers are: President, Dr. I. C. Curtiss; first vice-president, George C. Webb; secretary, Elmer E. Summey; treasurer, James K. Whittaker of New York.

The Pittsburg *Dispatch* says the Home Telephone Company will be reorganized and will secure a Pennsylvania charter. The sale of the company's property in Pittsburg was announced in our financial column last week.

The Barnesville (O.) Telephone Company has sold out to the Central District and Printing Telegraph Company of Pittsburg, Pa., which will now build a long distance line from Wheeling to Cambridge, O., connecting the towns en route.

New Companies Incorporated.

The Dunkirk & Fredonia Telephone Company, Dunkirk, N. Y. Capital stock, \$40,000. Directors: Robert J. Moorhead of Northeast, Penn.; J. C. Moorhead of Cleveland; S. Fred Nixon of Westfield, N. Y.; M. A. Phelps, F. W. Plato and G. H. Frost of Buffalo, and S. B. Rawson of Elyria, Ohio.

The Mankato Citizens' Telephone Company, Mankato, Minn. Capital stock, \$25,000. Incorporators: Lorin Gray, H. E. Hance, W. A. Funk, J. H. James, Ed. I. P. Stade, F. Kron, H. A. Patterson, John C. Wise, Jr., A. G. Bierbauer, John Klein, J. B. Meagher, O. W. Schmidt, W. N. Plymat and Nic Peterson.

The Knickerbocker Telephone & Telegraph Company, New York—to operate in New York City and extend its lines to Rouse's Point, Ogdensburg, Buffalo, Montauk Point, Fire Island, Weehawken, Hoboken, Jersey City, Bayonne, Elizabeth, Perth Amboy, Paterson, Newark, Orange, Plainfield, New Brunswick and Long Branch. Capital stock, \$7,500,000. Directors: Samuel B. Lawrence, Francis P. Lowrey, John B. Summerfield, Henry M. Haviland, Charles L. Horton, George E. Spencer and Henry C. Everdell, all of New York City.

The Buffalo Telephone Company, Buffalo, N. Y.—to operate a telephone line in Buffalo, to Lockport, Medina, Albion, Brockport, Rochester, Depew, Lancaster, Akron, Batavia, Churchville, Tonawanda, North Tonawanda, LaSalle, Niagara Falls, Suspension Bridge, Lewiston, Youngstown, Hamburg, Angola, Silver Creek, Dunkirk, Erie, Pa., Ashtabula and Cleveland, O., and also in the cities and villages other than those mentioned in Erie, Niagara, Orleans, Genesee, Livingston, Wyoming, Monroe, Chautauque and Cattaraugus counties, N. Y. Capital stock, \$500,000. Directors: George K. Birge, Daniel N. Lockwood, C. E. Williams, L. B. Crocker, William H. Kinch, Joseph Kennedy, William B. Hoyt and R. J. Getz of Buffalo.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.
 b Company controls Citizens' Railway, North Baltimore Passenger Railway, Baltimore & Curtis Bay Street Railway, Baltimore & Powhatan Railway, Pimlico & Pikesville Railway and Wallbrook, Gwynn Oak & Powhatan Railway and Park.
 c Owned by Brooklyn Rapid Transit Company.
 d Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.
 e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Heights Company.
 f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.
 g Owned by Atlantic Ave. RR. and leased to Nassau system.
 h \$200 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.
 i \$200,000 of stock owned by North Chicago Street Railroad Company.
 j Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
 k \$50 per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$225,000 of stock owned by West Chicago Street Railroad Company.
 l Majority of stock owned by Chicago West Division Railway Company; 5% on \$1,000,000 stock guaranteed by West Chicago Street Railroad Company, lessee.
 m Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. † Ex div.
 a Leased to New Orleans Traction Company at 8% on stock.
 b Leased to New Orleans Traction Company at 8% on stock.
 c Leased to Central Crosstown Railroad at 8% on stock and interest on bonds.
 d Operating the former Met. Trac. system, that corporation having become extinct.
 e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
 f Leased to Houston, West Street & Pavyonia Ferry—now Metropolitan Street Railway.
 g Leased to Metropolitan Street Railway at 8% on stock until Oct. 1, 1897; thereafter 9%
 h Leased to Metropolitan Street Railway for 99 years from Jan. 1, 1896, at \$215,000 per annum.
 i Leased to Metropolitan Street Railway for 18% on stock.
 j Leased to Met. St. Ry. for 99 years from April 20, 1892; 6% first 5 years, 8% thereafter
 k Leased to Metropolitan Street Railway for \$145,000 per annum.
 l Leased to Metropolitan Street Railway for 18 percent on capital stock.
 m Controlled by Third Avenue Railroad by purchase.
 n Dividends of 1% yearly guaranteed by Consolidated Traction Company.
 o Controls by lease the Allegheny, Cent., Citizens, Duquesne, Fort Pitt and Pitt's Trac. Co.
 p Leased to Consolidated Traction Company for 8% per annum on par value of stock.
 q Leased to Fort Pitt Traction Company for 8% on \$8,000,000 capital stock.
 r Leased to Consolidated Traction Company for 4% on capital stock after October, 1897.
 s Leased to Consolidated Traction Company for 7% on capital stock after October, 1897.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 10 3/4 @ 10 1/2 c.; Lake, 11 1/2 c.; cast, 10 1/2 @ 11 c.

The New Orleans Traction Company continues to show a good increase of earnings over last year. For the first ten days of February the gross receipts were \$34,090.75, against \$32,598.95 for the same period last year.

The hearing on the motion for the appointment of a receiver for the Little Consolidated, Cleveland, O., on petition of Frank De H. Robison, was concluded after arguments lasting three days. The decision was reserved.

The Edison Electric Illuminating Company of Brooklyn reports for January: Gross earnings, \$59,381; operating expenses, \$45,379; net earnings, \$14,002. The balance for dividend was \$35,352, an increase over the same month in 1896 of \$522.

Storage battery cars are being tried on the Grand street car line in New York, and cars thus equipped have made several successful trips over the road. The new cars are about as long as the Third Avenue cable cars and are lighted by electricity.

The shareholders of the Coney Island & Brooklyn Railroad have voted to increase the capital stock of \$1,000,000 to \$2,000,000. The increase, it is understood, is preparatory to complete consolidation with the Brooklyn City & Newtown Railroad, now held under lease.

The stockholders of the Milwaukee Electric Railway & Lighting Company held the annual meeting on the 21st ult., but it was little better than a formality, little being done beside the re-election of F. G. Bigelow of Milwaukee and William Nelson Cromwell of New York as directors.

The Boston Elevated Railroad Company has petitioned the Railroad Commissioners for permission to extend its tracks from the Cambridge line to the town of Belmont. The "Traveller" says the third-rail system has been decided upon for the elevated structure, with trolley propulsion for the underground. Trains will consist of three cars and a motor car.

The directors of the St. Louis & Belleville Electric Railway Company have published a notice calling a meeting of the stockholders at the office in East St. Louis on the 15th of April for the purpose of voting on the proposition of issuing bonds of said company to the amount of \$500,000, the same to be secured by a mortgage on all of the property of the company.

The Twin City Rapid Transit Company of Minneapolis has listed on the New York Stock Exchange an additional \$577,000 of 7 per cent. preferred stock, making total listed \$1,712,000. The proceeds of the new stock and of a new issue of three-year 6 per cent. notes for \$750,000 have been applied to the redemption of the \$1,435,000 6 per cent. guaranteed certificates issued in 1893.

The report of the Metropolitan Street Railway of New York City for the quarter ending December 31 last has been filed with the State Railroad Commission. It shows a net increase in earnings as compared with the corresponding quarter of 1896 of \$118,484. The report shows: Gross earnings, \$2,383,458; operating expenses, \$1,208,769; net from operation, \$1,174,688; other income, \$150,918; gross income, \$1,325,607; fixed charges, \$789,000; surplus income, \$536,600. The surplus income for the same quarter in 1896 was \$418,116. The general balance sheet shows cash on hand of \$1,163,807, and a profit and loss (surplus) of \$1,737,198.

Some of the street railway companies in Massachusetts have discovered a way of evading the law in regard to the issue of securities by issuing what they call "coupon notes" instead of bonds. One of these is the North Shore Traction Company, a corporation chartered in New Jersey, which in 1896 got possession of the three mile Beverly & Danvers street railway, capitalized for \$12,000. It issued \$40,000 of coupon notes, and before a bill to prevent such transactions could be passed through the Legislature it had sold \$1,250,000 of such notes, and it now has a capital of \$1,200,000 and a funded debt of \$1,629,000. The Railroad Commissioners have severely rebuked such transactions, and in the case of the Interstate Consolidated Company have thrown \$150,000 of coupon notes out of its assets; and they protest against the admission of any more foreign corporations to operate railways in the State unless also incorporated under Massachusetts laws.

Contracts have been closed with electric companies by the Brooklyn Elevated Railroad Company for the fitting of its cars and tracks with the necessary equipments to cross the Brooklyn Bridge. The equipment includes twenty-four new motor cars of the Sprague multiple unit pattern. The company intends to put the electric system in use on all of its cars and do away with the engines as soon as it is practicable that this should be done. It is believed that the crush during the rush hours at the Manhattan end of the bridge will be greatly relieved by the crossing of the elevated cars.

The Assembly committee at Albany has given several hearings to the opponents of the Sullivan bill fixing the price per hour for incandescent lights at three quarters of a cent and for arc lights at 4 cents. A representative of the Edison Electric Light Company told the committee that there was no demand for the measure from anyone but the Sullivans in House and Senate. He said the man who introduced the bill didn't know the prices now charged, and showed that the average present prices are lower than the prices fixed in the bill.

The New York "Journal" says: "Russell Sage has been investigating the Sprague motors with the idea that they could be used to advantage in the Manhattan Company's system. The Goulds and other large holders of Manhattan stock approve of them, and are only holding off to see the result of the Brooklyn company's experiment. It has been decided by the Manhattan Company that the Sprague motors are much better than the third rail system and the air motors."

The Cleveland "Plaindealer" says: "The recent activity in the stock of the Big Consolidated is said by a gentleman well informed in financial circles to be due to the intimation by an Eastern banking house that in case they could secure a controlling interest in the company they would be willing to pay as high as \$65 per share for stock, if forced to do so. This is said to be due to their faith in their ability to refund the bonds of the corporation at 4 per cent., these obligations now drawing 5 and 6 per cent."

The Railroad Commissioners of Massachusetts in their annual report have rendered a service to all interested in street railway management by showing where mistakes have been made and suggesting remedies to place the business on as stable a footing as that attained by any well established and conservative institution. They also give some hints to investors that it would be safe for them to heed in the following passage: "An intending investor in an existing or projected street railway enterprise will take into account the chances in a series of years of a management and success a little below as well as above the general average. If he desires a regular annual return of 6 per cent. on his shares, he ought to be convinced, we think, that the railway will carry year in and year out more than 135,616 passengers per mile operated, and more than 4,014 per \$1,000 of capital investment; otherwise, the probabilities, based on the experience of 48 companies, are that he must be content with a smaller return. Unless it can be demonstrated, moreover, that the railway will carry year in and year out more than 70,895 passengers per mile operated, and more than 2,532 passengers per \$1,000 of capital investment, the chances, as proved by the experience of 28 companies, are that he will receive no dividend at all. There is in fact a very narrow range of speculative possibility in street railway investment. The results are practically uniform from year to year, and grade on substantially the same levels with those of railroad enterprise. A certain density of traffic in proportion to mileage operated and to capital investment per mile, is absolutely essential to financial success, and is the substantial measure of such success."

EDITORIAL NOTES.

Low Cost of Steam Power in Buffalo.

From all accounts it is taking considerable missionary work to convince the manufacturers located in Buffalo that it would be more economical for them to adopt electricity furnished by the Cataract Power and Conduit Company than to continue using steam for the running of machinery.

As a result of this conservative feeling, and owing to the fact that the manufacturers could not clearly see where any material saving would be effected by substituting electricity for steam, the Cataract Company a short time ago retained an electrical engineer to examine various plants and make estimates of the comparative cost of steam and electric power. This has been done, and it is now stated that, according to the engineer's figures, a number of plants would derive benefit by the adoption of electricity. This may very possibly be the case in the manufacture of certain products that require a large and constant amount of power during 24 hours a day and for 365 days in the year, for in all probability the Cataract Company's expert has figured on prices which are quoted on maximum power. In most industrial operations, however, the demand for power is extremely variable, and in such cases a manufacturer would be paying for considerably more power than he was actually using.

As we stated in an editorial some time ago, when the Niagara Falls Power Company had just started, it is extremely difficult to see how under the existing conditions current can be delivered to Buffalo, a distance of nearly 26 miles, and be made to successfully compete with steam in any way but at a loss to the producer.

Electricity has in a number of instances been generated by means of water power transmitted over long distances, and proven more economical than steam, but invariably in such cases the local price of fuel was extremely high. An example of such a plant is that of Pomona, Cal., where current is transmitted over a distance of 28½ miles to San Bernardino at a pressure of 10,000 volts and is used for arc and incandescent lighting. In this instance it was found more economical to bring current 28½ miles than to erect a local power station to be operated by steam.

In the case of Buffalo, however, the conditions are very different. An excellent quality of coal can be procured in that city for \$1.80 a ton, or in other words, steam power can be generated for about one-third of a cent per horse-power hour. This figure does not of course include the item of labor and other incidental expenses, which however would probably not exceed twice the above amount, making the total cost of one horse-power hour one cent. To success-

fully compete with steam as a motive power, therefore, the Niagara company would be obliged to deliver one electrical horse-power at a motor in Buffalo for an amount not exceeding two-thirds of a cent. Whether this could be done and still leave a modest margin of profit to the producer is questionable. Another important point which should not be overlooked by the Buffalo manufacturer is the cost of changing their machinery if electricity as a motive power is adopted. There would have to be a decided saving due to the adoption of electricity to warrant an expenditure of probably thousands of dollars which such a change would entail. Taking it all in all, the Buffalo manufacturers cannot be blamed for showing a conservative spirit in this proposed innovation.

* * *

Technical Education.

The problem of striking a happy medium between a too theoretical education and a too practical education is an all-important one. This vital question is constantly being agitated both in Europe and in this country with apparently indefinite results. A thorough theoretical education is unquestionably an advantage to an engineer, but on the other hand, experience has shown that a student thus equipped on leaving a technical school is seriously handicapped until his ideas have become broadened by practical experience. In fact we have known of cases where manufacturing concerns have declined to employ recent engineering graduates, on the ground that it would require too much time to teach them the practical side of the business and that during that period their services would be of little or no value. This feeling on the part of manufacturing concerns arises from the knowledge that in most technical schools the student acquires long-drawn-out methods of arriving at mathematical results and has had little or no opportunity of learning anything of a practical nature. With a view to offsetting this theoretical tendency, several of the larger manufacturers of electrical machinery in this country require recent graduates who apply to them for positions to go through a certain amount of practical training in their shops, extending over a period of several years, at nominal wages before giving them anything like a reasonable salary or entrusting them with work of a serious nature.

Probably the hottest of theoretical training is however in Germany. In the latter country an embryo engineer is simply saturated, so to speak, with the higher mathematics for years before being allowed to graduate. This system, although favoring strongly of the methods in vogue during the Middle Ages, has however been the means of giving to the world invaluable theories and discoveries, through eminent scientists such as Helmholtz, Hertz, and others. Prof. Adolf Slaby, one of Germany's

highest authorities on electrotechnics, is credited in a recent issue of a daily paper with the following :

"Practical teaching is abhorred by the professors at most of our universities. I recollect attending a lecture by Helmholtz where I expected him to give some explanation of the dynamo. After making some theoretical observations, he merely said : 'Acting on these principles people have constructed some very ingenious machines called dynamos, for engineering purposes.' That was all Helmholtz would deign to say about the dynamo. The professors of to-day are just the same in this respect. Their teaching is purely scientific, philosophical, philological and historical and has not varied for three centuries."

The above statement, coming as it does from one of Germany's leading professors, is significant. It would unquestionably be a difficult matter to properly combine a theoretical and practical course in a university. If the theoretical training were thorough, there would necessarily in a four years' course be little time left to devote to the practical training, or vice versa. It scarcely seems right, however, that a student after graduating should be obliged to devote several years at little or no salary to modifying the ideas that were inculcated in him while at a university.

In Germany there are nine technical schools, the largest being at Charlottenburg, near Berlin. Others are located at Stuttgart, Hanover, Munich, Dresden, Aix-la-Chapelle, Karlsruhe, Darmstadt and Brunswick. As a rule these schools are divided into six departments, as follows : Architecture, general constructing engineering, machine construction, naval engineering, chemistry and mining engineering. Electrotechnics are taught in all the schools in the machine construction department, it being thought advisable and necessary that every constructing engineer should be thoroughly familiar with electrical machinery.

Many suppose that Germany, being a country of universities, the curricula of its technical schools have been overhauled and brought up to date, but such is not the case. Pure science would seem to be the principal aim of all these schools, the turning of the laboratory results thus obtained to practical account being despised by the majority of the university professors. This same tendency exists in this country, but to a lesser extent. An electrical engineer to be in any way successful in the United States should be, above all, practical, and when such a quality is combined with a high degree of theoretical knowledge, an engineer is exceedingly well-equipped for any duty he may be called upon to perform. Several of our technical schools have gradually been brought to see the value of combining a theoretical with a practical education, and have even gone to the extent of equipping shops with suitable machinery for the use of students. Such a step is to be commended, for even the limited knowledge a student obtains in this way proves of inestimable value after leaving his alma mater and entering into practical work. As Prof. W. E. Ayrton aptly stated in an address at the Coventry Technical Institute in England : "The ideal technical school would be one attached to a factory where the men could be systematically taught their business and the applications of science to their trade."

A Telephone Bill at Albany.

A telephone bill has recently been introduced in the New York Legislature by Senator Brush, providing for cheaper telephone rates as follows : In cities of 1,000,000 inhabitants and over, \$125; in cities less than 1,000,000 and more than 500,000, \$85; less than 500,000 and more than 100,000, \$48; less than 100,000 and more than 20,000, \$36; less than 20,000 and more than 8,000, \$30; places less than 8,000, \$27.

The introducing of a bill of the above character is

certainly a step in the right direction, for the charges of the New York Telephone Company in New York City are higher than the rates in any other city in the world. The arguments that Senator Brush brought up at a recent hearing before the Senate Finance Committee in support of his bill are exceedingly strong, and moreover give a good idea of how the public has been victimized for years by a monopoly without being able to obtain redress in any way. Some of the reasons Senator Brush gave why the bill should be passed are exceedingly instructive, the gist of them being as follows :

"The company has an absolute monopoly in New York and many other cities in this State.

"There is no competition to regulate charges and no limitation by statute.

"Taking advantage of this situation in New York, the company has by stages advanced the charge from \$60 a year in 1881 to \$240 in 1897.

"There is nothing to prevent similar advances in the future, if the company think the people can be made to pay them.

"The telephone has become a necessity, and as such, controlled by a monopoly, the charges should be regulated in the public interest.

"The rate in New York is higher than anywhere in the world for the same service.

"In six years, ending with 1887, the Metropolitan Company made a profit of 473 91-100 per cent. on its original investment of \$600,000. These figures were shown by testimony taken by the Ainsworth Investigating Committee. Such excessive profits made by a monopoly serving the public under a public franchise demand the interference of the police power of the State in the public interest.

"The companies use the public streets and highways, and the State should require that, in return for such privileges, the public, which confers the franchises, should not be unreasonably taxed for the service. The Ainsworth Investigating Committee of the Assembly, after a careful examination, recommended a bill which fixed the charge in New York at \$6.50 a month, or \$78 a year, within one mile of a central office. The rate then charged was \$150 a year, or nearly 100 per cent. higher than the Ainsworth Committee thought fully remunerative. All items of facts obtained by the Ainsworth Committee in 1887 were under oath.

"The capital of the Metropolitan Company in January, 1897, was \$3,300,000; that was the amount upon which the State tax was paid. There had been no increase for several years. Its earnings were : Year ending September 30, 1894, \$2,182,454; year ending September 30, 1895, \$2,419,194; year ending September 30, 1896, \$2,800,000. This shows an increase of earnings in two years, between 1894 and 1896, of \$617,546 on the same capital."

From all accounts the gross earnings of the New York Telephone Company should now be in the neighborhood of \$3,000,000 a year, as they claim they have a total of about 25,000 subscribers, 5,000 of whom pay \$240 a year and the remainder \$90. Allowing that the operating expenses of this company is one-half of its gross receipts, or \$1,500,000, there would be a clear profit of almost 50 per cent. on its present capitalization. The following abstract from Senator Brush's argument will give some idea of the actual cost of furnishing telephone service :

"In 1894 the Interior Department at Washington paid the Bell Telephone Company from \$60 to \$125 each for sixty-one telephones, which, together with the salary of the operator at the central station, aggregated \$4,883, being an average of a fraction over \$75 per annum per instrument. The next year, 1895, the Department put in a telephone system of its own, consisting of 140 lines connecting extra buildings in the city. They were attended by the same operator at the same salary as formerly, and, in addition to this, an electrician was employed to keep the lines in order at an expense of \$300 per year. Estimating the interest and depreciation of the

plant, the cost for each telephone is now \$10.75 per year, a saving of over \$64.25 on each instrument in use. In other words, the Department of the Interior performs for itself the same service at one-seventh the price formerly charged by the Bell Company for the same thing."

If the actual cost of rendering telephone service is but one-seventh of what the Bell Company is in the habit of charging, the expense that the New York Telephone Company is under, assuming all its 'phones are charged for at the rate of \$240 a year, is therefore but about \$857,500; or in other words, with the gross receipts aggregating \$3,000,000, they are making 65 per cent. clear on the capital invested.

From this it will readily be seen that it is high time that some measure was passed at Albany cutting this company's profits down to within a reasonable limit, and we trust therefore Senator Brush's bill will pass.

Under the Searchlight.

Notes and Comments on Various Topics.

FROM all accounts the Westinghouse Electric & Manufacturing Company are certainly going in for the gruesome. A short time ago this company made a contract for lighting a number of the catacombs in Rome, and now negotiations are said to be on with this same concern for lighting the interior of the Pyramids of Egypt. Probably the next thing this company will be after will be the lighting of the abandoned stone quarries under Paris which were used as a charnel house during the Revolution.

Keep it up, George, you are something of an adept at underground work, and having discovered a field where you are not likely to encounter competition, you may work it with more profit than you have found in undertakings nearer home.

* * *

"A standing reward," says the *Morning Telegraph*, "is offered in Wall Street for positive proof that Manager I. Harding of the Walker Electric Company is not bald-headed. It is not expected that any one will come forward to claim the reward, for no one ever saw Mr. Harding without his hat on. He always wears a very tall and very shiny silk hat, and he always wears it. In the office or out the Harding hat is kept on the Harding head. Some of the Walker Company's rivals would like to see the hat removed in order to satisfy themselves that it does not conceal some patent electrical appliance for galvanizing customers into signing contracts. The Walker Company has been securing so many of the contracts recently that the rivals are getting worried about it. Their hats are off to the Walker Company. There can be no doubt about that since the Walkers walked off with the contract for electrically-equipping the Brooklyn 'L' roads, leaving an aggregation of weeping directors at the offices of the General Electric and Westinghouse companies to mourn its loss."

* * *

A floating paragraph states that electrical workers are just now in great demand at the Brooklyn Navy Yard. The naval officials are said to be engaging all the available electricians in the immediate vicinity and sending them to various navy yards and ships where they are required.

* * *

FROM the following paragraph, which appeared in the last issue of the *Electrical Engineer* of London, it would seem as though the people of Great Britain were beginning to worry over the amount of electrical apparatus that has of late years been imported into that country : "According to a recently-issued official document, the United States sent to this country last year electrical apparatus of one kind or another to the value of nearly £88,000. When we add to this amount that of apparatus obtained from the Continent, we begin to ask what are

our factories doing? There is one thing they seem not to be doing, and that is making good profits. The share quotations are not particularly favorable. One thing we venture to prophesy, and that is the present craze for monophasic alternate current installations is doomed. Our commercial travelers are simply ages behind the times as things go elsewhere, and deserve to be kicked out of the market. Naturally, they are so kicked."

* * *

ACCORDING to one of the daily papers, electricity and spiritualism do not make a good combination. A medium who makes a specialty of luminous apparitions is said to have given a seance recently at the house of a scientific man and successfully reproduced from his recess in a darkened room the luminous visions of various deceased personages. While Shakespeare was on view, the awe-stricken audience was surprised to hear a gasping, gurgling noise proceed from his throat, while the head swayed to and fro as if in pain. A gentleman rushed forward just in time to save the great poet from suffocation by pulling out of his thorax a miniature electric lamp, connected by a slender wire to a small battery underneath his coat. On the principle of the school-boy's salamander trick of illuminating the face by putting a lighted match in the mouth, the medium caused a faint spiritualistic glow, enough to satisfy wonder-seekers, to suffuse his countenance by inserting, before his hands were tied to insure confidence, the tiny electric lamp behind his teeth. Unfortunately in this case the article slipped too far down, and as the medium's bound hands prevented him pulling it up again the unfortunate man came very near being choked to death by an incandescent lamp.

* * *

How He Satisfied the Brewer.

We find the following amusing tale in *The Telephone*:

J. G. Nolen, who is an oldtimer in the electrical construction business, tells a good story on "Val" Blatz, the millionaire brewer of Milwaukee.

Mr. Nolen says: "Our company had had some correspondence with Mr. Blatz regarding the putting in of a telephone plant in his big brewing establishment, and I was sent up to try to close a deal.

"I took a couple of our 'phones with me in order to make a practical demonstration, should one be required, and I went with the intention of making a sale.

"I got to talking with Mr. Blatz and showed him the advantages of putting in our inter-communicative system throughout his establishment. He listened attentively, and finally said:

"Yes, that is all so; very true. But," and he spoke with the conviction of one who was putting a poser, "but my men down in the malt-house and the warehouses and cold-storage are all Dutchmen.

"I, myself, though a German, and a graduate of the universities of Leipzig and Heidelberg, can speak English, but what good would your telephones be to my Dutch workmen, who cannot talk English at all?"

"Well, I saw how the land lay. Old 'Val' could not get it through his head that the telephone would transmit anything but the language of America. I was bound to make the deal, as I said before, so I remarked to Mr. Blatz:

"I can put on some German receivers if you so desire. I have some with me."

"I connected up the 'phones, made a show of changing the receivers, and in half an hour Mr. Blatz was talking to one of his 'Dutchmen' down in the malt-house. He was delighted.

"You may put them in," he said, "and I shall want one German one in the malt-house, one German one in each warehouse, English ones in my office and the business office, and a German one in the cold-storage house."

"We closed the deal, and Mr. Blatz was glad to pay \$2 extra for each 'German annunciator' we put in. When the 'phones were shipped from the factory I had them labelled German and English respectively, and the big brewer was perfectly satisfied.

"It was five years before I saw Blatz again," concluded Mr. Nolen. "He recognized me at once, and said, with a hearty German laugh, 'You are the accommodating gentleman who put in the German and English telephones for me. Well, you are a good one.'"

The Resistance of Silicon.

In a communication to the Academie des Sciences, M. Fernand Le Roy gives the results of some tests

he has made on the electrical resistance of silicon. In view of its high specific resistance M. Le Roy suggests that this non-metal should prove of service for electric heating. Another advantage of silicon for this purpose would be its high specific heat and great emissive power. In the experiments the best results were obtained with the crystallized silicon or graphitoid, originally obtained by M. Sainte-Claire Deville. During the experiments, which have been continued for nearly three years, M. Le Roy has not yet been able to determine the exact specific resistance of the material, as he finds that it varies greatly with the state of pulverization, the compression and with its preparation. It is, however, easy to obtain rods of pure agglomerated silicon of a sectional area of 40 sq. mm. and a length of 10 cm., which have a resistance of from 25 to 200 ohms. The resistance of a rod of electric light carbon of these dimensions would be 0.15 ohm, and that of a rod of german silver of the same size 0.0008 ohm. The experimenter also found a decrease in resistance with increase of temperature. When such a rod was raised to 800° C. its resistance decreased about 40 per cent.

ELECTRICAL ENGINEERING AT COLUMBIA UNIVERSITY.

The new buildings of Columbia University are located at 116th street between the Boulevard and Amsterdam avenue, New York, on the highest part of Morningside Heights, midway between Grant's Tomb and the new Episcopal Cathedral, commanding a view of the Hudson on the west and the Harlem River on the east. Thus situated in a great metropolis, the University secures the manifold advantages which that fact gives it, and at the same time is sufficiently lifted above the hurry and noise of the city to have the collegiate atmosphere. This effect is still further increased by the fact that the grounds between the various buildings form a plateau about twenty feet above the level of the grounds and streets outside of the group of buildings. By this arrangement great economy of space is secured, since it gives two more floors to each of the buildings situated around the edge of the plateau, their basements and sub-basements being above the level of the surrounding grounds. The raised level between the buildings also enables tunnels to be constructed which connect the various buildings with the central power plant in the University Building. Through these tunnels all the steam and gas pipes as well as the electrical conductors are carried and the cartage of coal, ashes and supplies takes place.

In this way these important practical matters are very conveniently carried on below ground as far as the college is concerned, but at the same time above the street level. Each building is provided with an elevator, chiefly used for carrying apparatus and supplies to and from the various laboratories, lecture rooms and museums. Thus it is an easy matter to transport even heavy apparatus from any room in the University to any other room. To still further facilitate this service, the door sills are entirely omitted in most of the rooms, so that a truck can be run about the buildings without jarring that which it carries, enabling apparatus to be arranged in the laboratory for use in the lecture rooms.

The various buildings at the new site are grouped about the magnificent Library presented by President Low which is centrally located and easily accessible from all the others.

University Hall is the other general building, containing the power plant, gymnasium, academic theater, etc. There are also four new buildings respectively devoted to engineering, chemistry, natural science and physics. Two old buildings will be used for the present by the departments of Ancient and Modern Languages and Mathematics.

The Schools of Law, Political Science and Philosophy are located in the Library Building, bringing

them within convenient reach of the books upon which they are especially dependent. The Medical School will remain at Fifty-ninth street, between Ninth and Tenth avenues, where it is well provided with buildings and equipment. All the other departments of the University, including Barnard College and the Teachers' College which are affiliated with it, have removed to the new site.

The Engineering Building, with its annex, contains the departments of Electrical, Mechanical, Civil and Mining Engineering. Havemeyer Hall, the Chemistry Building, is the home of one of the largest and best equipped chemical schools in the world, having been designed by Prof. Charles F. Chandler and the officers of his department after a careful study of the principal colleges and technical schools in this country and abroad. The department of Architecture is temporarily housed in the Chemistry Building, which has more than sufficient space for present needs. Sohermerborn Hall, the Natural Science Building, contains the departments of Geology, Mineralogy, Biology, etc., and their extensive collections. The Physics Building, which also accommodates the departments of Mechanics and Astronomy, is designed and equipped according to the most modern methods for teaching and investigating physical science.

It is a striking fact, characteristic of modern tendencies, that all four of the new buildings, besides the Library and University Buildings, which are used for general purposes, are devoted entirely to science; and three of them are especially important in their relation to electrical engineering. Hence the course in Electrical Engineering at Columbia, which has already gained for itself a prominent position in electrical education in this country, has been materially benefited by the removal of the University to its new site. The principal improvements consist in a considerable extension of space and equipment in the Electrical Engineering laboratories, as well as in those devoted to Mechanical Engineering, Physics and Chemistry.

The regular four years' course, leading to the degree of Electrical Engineer (E. E.), is designed for the education of professional electrical engineers who intend to devote themselves to the practice of this profession either as teachers in colleges and scientific schools or as engineers, managers or experts in manufacturing or other industrial enterprises.

The course of instruction includes not only all important branches of theoretical and applied electricity, but also the other collateral sciences which have been found by experience to be required by the electrical engineer, such as mathematics, physics, chemistry, drawing, analytical mechanics, mechanical engineering, including a thorough course in steam and other engines, as well as transmissive machinery and shopwork; general engineering, including construction in masonry, iron, steel and wood, also forms part of the course.

Hence the graduate in the course in electrical engineering is provided not only with a thorough knowledge of the principles and practice of electricity, but also with such a broad and liberal education in the allied sciences as will prepare him for every demand that is likely to be made upon him in after life in connection with his profession, and will also enable him to become an investigator. The instruction is by lecture, recitation, laboratory, workshop and drawing-room practice, with periodical examinations. Special attention is given to new methods and forms of apparatus in order that the student may be brought fully abreast of the rapid progress of electrical science and practice. Frequent visits are made to the numerous electrical factories, stations and other establishments in and about New York.

EQUIPMENT.

The offices, laboratories, lecture and other rooms of the Electrical Engineering department are in the south end of the Engineering Building. In the sub-basement are located the storage battery and pho-

tometer rooms; the former contains a battery of 70 cells, to be used for efficiency and output tests and also as a source of steady potential and current. The photometer room is equipped with all necessary apparatus for determining the candle power of arc and incandescent lamps as well as other sources of light. In the basement are situated the two machine laboratories, the larger containing the direct current machinery, while the smaller accommodates the alternating current apparatus. In the former, a 50 HP. high speed steam engine drives two lines of shafting, carrying pulleys controlled by friction clutches, to which the various machines are belted. The arrangement of the engine and shaft is such that two dynamos of 30 kilowatts each can be connected to the engine, or either or both of the two machines may be used as motors to drive the line shaft, the current being obtained from the electric light and power plant of the University. In this way the breaking down of the motive power is rendered almost impossible and an excellent demonstration of the two methods of driving is made.

The various dynamos which are belted to the line shaft include examples of 115, 230 and 500 volt constant potential generators, constant current arc-lighting dynamos, and other typical machines. Several types of stationary and railway motors as well as motor dynamos are also placed in this room. Machine and hand tools are provided in one corner of this laboratory for making and repairing apparatus, attachments, etc. Complete sets of ampere and volt meters, speed indicators, transmission and absorption dynamometers, etc., are available for testing the various dynamos and motors. The smaller machines are mounted upon two long, heavy tables, which brings them to a convenient height and affords space for instruments, note books, etc.

In the other machinery laboratory, the alternating current apparatus is placed, including single and polyphase generators, induction and synchronous motors, as well as various types and sizes of transformers. Each generator is driven by its own electric motor, enabling its speed to be independently regulated.

On the first floor are situated the smaller lecture room (seating 70), ordinarily used for class work, and the larger lecture room (seating 150) for combined classes. In the Chemical Building, immediately adjoining, a still larger lecture room (seating 350) is available for meetings and public lectures. All of these rooms are provided with an ample supply of electrical energy of different forms, as well as gas, water, and other facilities to enable experimental demonstrations to be conveniently and effectively performed. For example, dynamos, motors and other apparatus of practical size are shown in actual operation to illustrate the lectures, this being made a special feature of the instruction.

The museum contains cases for the collection of apparatus, models, materials, etc., relating to electrical engineering. This museum adjoins the lecture rooms so that its contents can be conveniently used for illustration.

On the third floor are located the large instrumental laboratory, the research room, and the studies of the officers. The laboratory contains a number of tables on which the instruments are permanently set up ready for use. These include various forms of galvanometers, ampere balances, standard cells and resistances; apparatus for measuring inductance, magnetic permeability, hysteresis and leakage, laboratory standard volt and ampere meters; telegraph, telephone and electric signaling systems; thermo-electric and electrical heating devices; Roentgen ray apparatus. The research room is used for special postgraduate and thesis work, and is fitted up according to the lines of investigation that are being followed.

A most important facility is the large and reliable supply of electrical current which is afforded by the central power plant of the University. This consists of boilers having an aggregate capacity of 2,000 HP.,

two low-speed engines directly connected to two dynamos of 275 HP. each, and two high-speed engines directly connected to two dynamos of 100 HP. each. This electrical generating plant, having a total capacity of 750 HP., and illustrating the latest practice in electrical engineering, furnishes current for electric lighting and for driving the motors and fans used in ventilating all of the buildings. Special conductors are also laid to convey to all the laboratories as well as lecture rooms of the Electrical Engineering department an ample supply of current for experimental work.

The physical laboratories and lecture rooms occupy four floors of the Physics Building on the eastern side of the University grounds. The building is supplied with all ordinary conveniences, including electricity for power and light, compressed air and steam. There is a vertical shaft 95 feet high with gas, electric and water outlets at every ten feet. In the sub-basement a constant temperature room is placed 12 feet below the surface of the ground. A platform on the roof is available for meteorological observations, an instrument room being directly below. There are two lecture rooms, a library, an apparatus room, and laboratories of various kinds.

The general elementary laboratory includes in its equipment, linear and circular dividing engines of various designs. For measurements of mass there are provided balances with weights, specific gravity apparatus, hydrometers, aerometers and the various forms of vapor-density apparatus. Standard barometers, pendulums, and apparatus for studying elasticity are provided, also apparatus for the study of sound.

Thermometers and apparatus for their calibration and determination of zero and boiling points are supplied; also apparatus for determination of coefficients of expansion, for latent and specific heat and calorimetry.

The optical rooms are furnished with spectrometers of different designs, spectroscopes, telescopes, microscopes, sets of lenses, prisms and gratings, optical benches, photometers and apparatus for colorimetry, polarized light and spectroscopy.

In the rooms devoted to electricity are galvanometers of various patterns, high and low resistance, ballistic and damped; electrometers, magnetometers, standard cells, resistances, rheostats and bridges of all types; condensers, batteries, keys, arc and incandescent lamps, amperemeters and voltmeters.

THE MECHANICAL ENGINEERING DEPARTMENT.

The Mechanical Engineering department is located in the Engineering Building and in the Annex, the space and equipment provided for it being greatly increased at the new site. This improvement is made not only on account of the importance of this branch in the electrical, civil and mining engineering courses, but also because regular courses in mechanical engineering have now been opened at Columbia for the first time, the space at the old site not having been adequate for the purpose. The department has the following equipment:

The wood-working and machine shops are located in the Teachers' College, 120th street. For wood-working there are carpenters' benches with their kits of tools, speed-lathes, saw benches and planers. For forge and blacksmith work there are forges with anvils and tools, a Bradley hammer and a Billings & Spencer drop-press. For metal working there are engine-lathes with swing from twelve inches to twenty inches, planers, shapers, drill-presses, a universal milling machine, universal grinding machines and a Jones & Samson turret-lathe.

The testing laboratory is equipped with high-grade testing machines for tensile, transverse, torsion and compression tests. Their designs are of diverse types to give wide experience in handling, and they are fitted with the best and newest appliances for observing and recording deformations of test-pieces. The Emery testing machine of 150,000 pounds capacity is used as a standard of reference.

The Mechanical Engineering laboratory is well

supplied with dynamometers of transmission and absorption types, with oil-testing appliances, speed recorders, tachometers, weighing and measuring apparatus, anemometers, gauge testers and the like, and representative machines and mechanisms for calibration and tests of efficiency.

The Steam Engineering and Motive Power Laboratory has an extensive series of indicators, with appliances for calibrating and standardizing them, test-gauges, thermometers, calorimeters, pyrometers and apparatus for boiler and engine tests. A triple expansion steam engine of the Reynolds-Allis-Corliss design is arranged to work as an experimental steam engine by making it a three-stage air compressor when so operated, and having all facilities for the accurate measurement of efficiencies. A full line of boiler-feed injectors is mounted for display and experiment. Steam engines of various other types, steam pumps, a ten-horse-power De Laval steam turbine, hot-air and gas engines are at hand, and surface-condensing appliances as well. The department has also a cross-compound two-stage air compressor, the cross-compound steam end of which with reheater, combined with the cross-compound air end with inter-cooler, makes a most complete example of applications of thermo-dynamic theory to practice. This laboratory is known as the Allis Laboratory in memory of the late Edward P. Allis.

The Hydraulic Motors Laboratory contains tanks, weir-notch equipment gauges, current-meters, water-meters, and motors for test and experiment. Constant pressure is secured by air-pressure upon the water in a closed tank, thus doing away with a stand-pipe. For heavier pressures, above 100 pounds per square inch, an adjustable accumulator is used. Pumps of large capacity give the necessary quantity of water for orifice tests and other drill in hydraulic engineering. The equipment of this laboratory is presented as a gift to the University as a memorial of the late Henry R. Worthington of New York City.

The Drawing Academies are particularly well lighted and of large extent, and are fitted with the best forms of drawing tables and furniture, as well as extensive collections of patterns, models and illustrative drawings, blue prints, photographs and prints which are useful as copies and for training in design.

The cabinets or museum collections of Mechanical Engineering exhibit models of mechanical movements, mechanisms and gearing, also material which has failed in service and under test. Specimens of apparatus and materials for practice are also included.

The Chemical Department occupies Havemeyer Hall, which is located at the northwestern corner of the group of buildings. It contains several chemical lecture rooms fully supplied with apparatus and instruments and all modern facilities for the experimental illustration of the different lecture courses.

The Museum of General Inorganic and Organic Chemistry and of the Chemical Arts contains the elements and all their more important compounds; representative sets of specimens of all classes of compounds, materials and products, together with models, pictures and diagrams.

The Qualitative Laboratory is provided with tables, reagents and all the necessary facilities to enable each student to become familiar with the reactions of the different metals and salts.

The Quantitative Laboratory is provided with tables, reagents and all the necessary apparatus and instruments to enable the student to actually execute quantitative analyses.

There is also a laboratory specially fitted up for electro-chemical work.

The theoretical as well as practical branches of electrical engineering are taught by Professors F. B. Crocker and M. I. Pupin and by Messrs. G. F. Sever, W. H. Freedman and S. G. F. Townsend.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY.**

A SURVEY OF THE POSSIBILITIES OF ELECTRIC HEATING AND COOKING.*

BY W. P. ADAMS, A.K.C., A.I.E.E.

(Concluded from page 118.)

I have so far made no comparison between the cost of cooking by electricity and that by other means. I shall not deal with this question much in detail, as I think it more practical at the present time if a general idea is given as to what the actual consumption of electricity will be, for the cost by other means varies largely under different circumstances. I have, however, some figures to hand obtained in a kitchen where both gas and electricity could be used at will. The household was a small one, consisting of about five persons, and the consumption of electricity was approximately 30 units per week when cooking was done solely by this agency. When gas was employed exclusively 1,240 cubic feet of gas were used during a week. The cost then of electricity at 2½. per unit is 5s. a week, and of the equivalent amount of gas at 3s. per 1,000 cubic feet is 3s. 9d.

The figures of consumption which I have given above are the most complete at my disposal, and this is my reason for bringing them before your notice, but I have other results to hand which indicate that the consumption of current may be reduced below the figures given when the appliances are used intelligently and with care. For small installations such as we have considered, one may assume roughly that a unit per head per diem will suffice for all cooking purposes. These figures will naturally be reduced in larger establishments, and experience seems to point to about 1s. 2d. a unit as a sufficient allowance in kitchens where more than 30 or 40 persons have to be provided for. The best results will be obtained where there is a hot water supply. Many of you are probably aware that heating water by electricity is a most uneconomical proceeding, at any rate at the present prices, and where an establishment is sufficiently large it is always recommended that a slow combustion stove be fitted to supply all the hot water for the household. In many houses such a stove is already fitted.

There is one direction in which one might anticipate a large development of electric cooking, and that is in flats. If architects will arrange for a general hot water supply for the whole building, as I believe is now done in many cases, electric cooking presents such an advantage that an important movement in this direction should take place when the supply companies are convinced of the advantage of charging such prices as will be generally acceptable. I think I have said sufficient to indicate that even with electricity at 3d. per unit electric cooking is not extravagantly expensive, and if its other great advantages are taken into consideration, particularly the economical results from the perfection of the cooking, it ought to be received with prompt favor.

I am hoping that before long those responsible for electricity supply will begin to make a definite move in the development of electric heating and cooking. It is not sufficient to merely reduce the price of electricity to a reasonable figure, as many of the Corporations have already done, but steps should be taken to induce people to become users of electricity for other purposes than lighting. It may be said that such steps are not in the province of electric supply concerns, but if the Corporations undertake the supply of light to towns, it is surely obvious that it is to their advantage to put every facility in the way of the ratepayers to use as much electricity as possible. It surely needs no argument to convince a company that its policy should be to try and obtain as many users as possible, whether for lighting or power or heating, as every unit sold means a

certain amount of profit. It must therefore be of advantage to a town undertaking its own supply to sell as much electricity as it can, not in this case in the interests of shareholders, but in the interests of the ratepayers. The hire system, which the gas companies are much in favor of, should be adopted where possible. One of the difficulties which have been met with in the attempt to develop electric heating is the high first cost of the apparatus. This is largely owing to the comparatively small output of heating apparatus at the present time, and is also owing in no small degree to the many different voltages which the goods have to be made up for. You will probably be surprised to learn that there are no less than 14 different voltages in general use at the present time, and you will quite appreciate that this does not tend towards the cheapening of the appliances.

I have little doubt, if supply companies are prepared to give this matter their careful attention, that mutually satisfactory arrangements might be come to between themselves and manufacturing firms so as to meet these difficulties.

It may be worthy of mention in passing that many supply companies and local authorities have no power to hire out apparatus in the same manner as the gas companies; and in view of the probable development in this direction, I would recommend that all companies and authorities applying for powers in future should include this in their application. Existing companies can obtain the necessary powers by taking the usual legal course.

I have now to consider the practicability of using cooking and heating plant in connection with plant installed for lighting residences and factories.

In very few well-arranged and properly-managed private installations does the cost exceed 4d. a unit, and in residences where accumulators are used it would simply mean running the plant a few hours a day extra if electric cooking apparatus were adopted.

Assuming that the extra wear and tear of the plant is negligible, which I am justified in doing, and that the man in attendance has to devote most of his time to the electric lighting plant, the only additional cost incurred is the additional fuel consumed and oil and waste used. This may vary between ½d. and 2d. per unit.

In the case of a gas engine supplied with town gas at 3s. per 1,000 cubic feet, and consuming 20 cubic feet per brake horse power hour, the cost per unit would be 1.18d. In the case of an engine supplied with producer gas, and consuming 1½ lbs. of coal per brake horse power hour, the cost would be .26d. per unit, with coal at 20s. per ton. With steam plant, the cost of coal consumed will vary considerably; but in no case where reasonably economical plant is installed should it exceed 2d. per unit.

In factories where large electric lighting plants are in use the same argument holds good. The probability is that the generating engines are supplied with steam from the main boiler system, and the man in attendance on the general machinery is expected to look after the electric lighting plant. The cost of generating electricity during the daytime for cooking meals for the staff of this establishment and perhaps for the employees, is, in such a case, almost a negligible quantity.

It may be considered superfluous to mention that water power installations form an ideal opportunity for the employment of electric heating, as in this country the amount of water power available is but small. It will be obvious to you that in country houses lighted by the agency of water power there could be no cheaper means of cooking and heating than by running the generating plant during the day. The cost of fuel is nil, and it is a fact that in many country houses in Scotland, where coal has to be carted many miles, such installations are in existence, and there should be no hesitation in recommending the adoption of heating and cooking appli-

ances. As a matter of fact, several houses have already adopted this plan with great satisfaction.

Abroad, of course, the conditions are different. Large water powers are available in different countries, and there at any rate should be a field for the development of heating and cooking in which they would stand absolutely unrivalled. The largest order for electric radiators ever received was placed not long ago for heating offices supplied from a water power installation.

I must here make a small digression to call your attention to the curious ideas some people hold with regard to electric cooking. An establishment in Liverpool had just installed a large and economical plant for electric lighting purposes, and it had been proposed to the owners that they should use it during the daytime for cooking purposes. I was asked by the electric light contractors to loan some apparatus for testing, and, the conditions being distinctly favorable, this was done. A little later I was informed that the committee would not adopt electric cooking. I was anxious that the test should have been made under my supervision, but it was not thought necessary for me to be present. Inquiries were made, and I found that the committee itself had superintended the experiments and had insisted upon the food being placed on the appliances before current was turned on. As one of the elementary rules of cooking is that the apparatus should be heated up to the proper temperature before the food is placed upon it, you will understand that such an experiment was foredoomed to failure. I relate this instance as an illustration of the common idea that electric cooking apparatus is capable of doing things which no one would think of expecting from ordinary cooking apparatus, and simply for the reason that the word "electric" is used in connection therewith. Every electrical engineer at one time or another has met with peculiar ideas of this sort.

There is nothing of course, nothing magic, about electric heating and cooking appliances. The advantages which we claim for them is: (1) that they are more economical in point of heat utilized than any other appliances, (2) that they are quite without equal in point of cleanliness and general convenience, (3) that there is practically no waste of material in the cooking, (4) that by their means cooking is reduced to a simple science, and absolutely uniform results can be obtained, this being due to the ease with which the heating effect is controlled by switching. In the oven it is usual to fix a thermometer indicating on a dial on the front of the door, and given temperatures can be maintained within a few degrees. I might further claim that such appliances are perfectly free from such dangers as attend the use of gas cookers. Explosions are impossible and the risk of fire is nil.

I must now beg of you to spare me a few minutes for the consideration of electric heating by radiators. I have already indicated at the commencement of this paper that this subject requires consideration from quite a different point of view to electric cooking. Assuming for the moment that there is likely to be any large development, you will at once observe that this will bring no load to the stations during the summer time, and, owing to the large amount of current the radiators consume, they will make the winter load heavy. It may be that persons who adopt electric cooking may be inclined to use the apparatus during the summer time only, on account of its coolness, in the same way as people now adopt gas ovens, returning to the use of the kitchen range in winter. If this were done to any large extent it would probably meet the difficulty, and it might even be desirable for supply companies to give special terms for the use of electric cooking appliances in summer, and increase these charges during the winter. Whether such a plan is feasible or not will have to be ascertained as the problem develops.

When estimating roughly what current radiators are to be wound for, for a given space, I generally

* Read before the Northern Society of Electrical Engineers, Manchester, Eng., January 24, 1898.

assume that 500 watts will be necessary per 1,000 cubic feet of space, in the coldest weather. This, of course, is only a very rough guide, and in every case the general conditions must be taken into consideration. In my office in the city, which has a capacity of 2,000 cubic feet, with one outside wall almost entirely consisting of window space, I rarely use a larger radiator than one absorbing 600 watts. In sharp weather I have found it necessary to put two of these on for the earlier part of the morning, and sometimes on Mondays, after a continued frost extending over Saturday and Sunday. In this instance it will be seen that a less quantity is required than 500 watts per 1,000 cubic feet of space. In the case of a building with several thin outside walls and other unfavorable conditions, probably more than the 500 watts would have to be provided for.

With radiators consuming this amount of energy you will appreciate that electric heating is not likely to receive much support when such charges as 8d. per unit are made. At the beginning of last year I was requested by an architect to fit nine radiators in a spacious office in the city. The firm was a wealthy one, and expense was not considered an important matter owing to the convenience of the electric radiators. I pointed out before the order was placed that the cost of current would probably be very high; but, notwithstanding my warning, it was decided to have the radiators fixed. After they had been running for three or four months I was informed that the cost was so excessive that their use would have to be discontinued. With one or two small exceptions these are the only radiators ever installed in the city of London; and, while the prices are maintained at the present figure, little development is likely to take place; and yet the city is an almost ideal place for the use of electric radiators, owing to the fact that the bulk of the offices close at an early hour, and that the occupiers are willing to pay a good price for so convenient and sanitary means of heating as electric radiators provide.

Experience shows that even at so high a figure as 3d. or 4d. there is considerable demand for electric radiators, and this is not surprising when one considers that the heat produced is of exactly the quality that one could desire. It is not sufficiently high to deprive the air of its moisture. There are no products of combustion to vitiate the atmosphere, and the radiators are turned on and off with the same ease as the electric light.

It is, of course, obvious that persons of means will be the first to adopt electric heating, and that, as the price diminishes, so those of less liberal incomes will be able to avail themselves of this method of heating. This is simply a repetition of the experience met with in connection with the electric light.

There is one direction in which electric radiators should prove valuable, and this is in ship heating. The present system mostly in vogue is steam heating, and this is constantly a recurring source of trouble and vexation and also of expense. Electric radiators can be fitted on board ship with very much greater ease than steam radiators and piping, and give absolutely no trouble when once installed. The cost of installation, including the additional generating plant, is very little in excess of the fitting of steam heaters, and in some cases may be even less. I am sorry that the time at my disposal will not admit of my enlarging on this and many other points of interest in connection with electric heating.

During the last few minutes left at my disposal, I would briefly call your attention to other directions in which electric heating is capable of considerable development. Hot cupboards, for use in dining rooms and serving rooms of private houses and clubs have been received with some little favor; and as they are generally brought into use after the main work in a kitchen is finished, they will doubtless help to fill up the dip in the load curve which occurs after midday and during the progress of late dinner. While they take a considerable amount of current while heating up, they are not in use for sufficient

time to make the cost of much account. Hot plates of various types are in use, for keeping plates and dishes warm during meals, in a similar manner in small establishments where hot cupboards would not be required, and these would all be a help towards filling up the after-dinner depression in the load curve.

I cannot now make detailed mention of the smaller heating appliances, but I think that their employment is one worthy of some consideration by supply companies. If they are at all largely adopted, they would be of value in increasing the day load, and it is likely that they would be employed at times when the cooking apparatus would not be in use. Take, for instance, the electric kettle. Each kettle takes from 300 to 500 watts, and they are mainly used for preparing tea in the afternoon. It is conceivable that, if used in large numbers, they would help to fill up the somewhat awkward dip in the curve occurring about 3 or 4 o'clock in the afternoon, after the hot cupboards and plates had gone out of use.

In conclusion, I will ask you to be as lenient as possible when passing judgment upon this paper. I am well aware that I have been guilty of some temerity in venturing to read a paper upon a subject about which there is so little practical knowledge. My excuse for doing so is that I believe there is a reasonable probability of considerable development in this direction in the near future; and I hope that the figures which I have placed before you may help electrical engineers and others interested to understand better the claims that this branch of electrical engineering has upon them. I have attempted to deal with the problem as widely as possible, and I hope that the aspect of affairs from the central station engineer's point of view may receive some consideration during the discussion.

AN ELECTROLYTIC PROCESS FOR THE MANUFACTURE OF PARABOLIC REFLECTORS.*

BY SHERARD COWPER-COLES.

(Concluded from page 120.)

During the several operations that have been described, the glass mould (which in the case of large reflectors is of considerable weight) is handled by means of a sucker placed on the concave side of the mirror. The silver mould when silvered and burnished is placed in a ring, marked B in Figs. 1 and 3, which is attached to the frame, D; the ring serves to form an electrical connection with the silver coating. To determine the size of the reflector that is to be formed, and to ensure a clean edge, a ring, N, Figs. 2 and 3, is placed, having the proper internal diameter, and bearing at its inner edge against the mould, as shown in the figures. Wooden blocks, G, of the required thickness are inserted between the rings B and N, and the ring is secured in place by the clamps, O, as shown in Fig. 2. The ring N may be made of insulating material, or it may be a brass, copper or lead ring, having its lower face protected by suitable varnish to prevent the deposition of metal upon it. The ring B, Fig. 1, is suspended by bolts, C, and cross-bars, D, forming a frame which is connected to vertical shaft, E; the said shaft is carried on the main frame, E, of the apparatus by a bearing fitted with ball bearings marked F², which supports the shaft by means of a collar, and is allowed to rotate freely. G is a pulley through which shaft E and mould A may be rotated by a belt or cord. The depositing tank is carried by a frame, to which the mould is suspended, so as to be in contact with the electrolyte, which is a solution of copper sulphate; the anode is arranged at the bottom of the tank, and the current conveyed to it by means of copper strips. It is found advantageous to have the anode flat, as it reduces the tendency for the copper to "tree" at the edge of the mould; it also has the additional ad-

vantage of rendering the reflector thicker in the center. The electrical connections between the negative terminal and the silver coating of the reflector is made through the ring B, bolts C, strips of metal, D¹, on the arms of the frame D, the shaft E, the ball bearing F². Fig. 6 is a perspective view of the cross frame for suspending the mould, and shows the metal strips for conveying the electric current. The connection of the frame to the shaft is made by a joint, E³, that allows of the mould being tilted, for the reason that I will now describe to you. When

FIG. 1.

first lowering the mould into the solution it is advisable to avoid throwing the work of carrying the whole electric current on the silver alone, so the shaft E is raised by means of pulley blocks, or otherwise, to suspend the mould. The mould is then tilted and the shaft gradually lowered, bringing the edge of the mould in contact with the electrolyte, the circuit being thus established. A thin film of copper is deposited on the mould at the place of contact near the edge of the mould. The shaft is then lowered until it rests on the bearing; at the same time the mould is allowed to gradually assume its horizontal position. The operation I have just described occupies a very brief interval of time, and the current for a few minutes is worked at a pressure of about 9 volts, which is ultimately reduced. It is very important that the silver be flashed over with copper immediately on immersion in the copper sulphate solution. At this stage the ring N is not applied, and the mould simply rests on the ring B. The shaft is then rotated, and the operation of depositing the base metal continued with a current density of about 19 amperes per square foot, and is proceeded with until a sufficiently thick coating is obtained to act as a good conductor to the electric current. The copper solution generally used is of the following composition: Copper sulphate, 13 per cent.; sulphuric acid, 3 per cent.; water, 83 per cent. The ring B, with the mould in it, is then lifted out of the bath, and the ring N applied to de-

FIG. 2.

FIG. 3.

termine the size of the reflector that is to be formed; after which the mould is again placed in the bath, and the operation of depositing the backing proceeds until the required thickness is obtained. During this stage the copper is deposited on the mould up to the inner edge of the ring N, which thus determines the diameter of the reflector, and also ensures a clean, even edge to the reflector, which requires no further treatment. In place of the ring N, shown in Figs. 2 and 3, a leaden ring, P, Fig. 4, may be employed. The leaden ring is secured to the ring B

* Paper read before the Institution of Electrical Engineers, London, February 9, 1898.

by the clamps O; this ring, being soft and pliable, will bend to the angle of the mould and the ring B, and therefore does not require to be blocked up as does the ring N. Fig. 3 shows a modification of a mould having its edges bevelled in the direction indicated—that is to say, in the reverse direction shown in Fig. 2. In such cases the mould is supported by a number of narrow rigid supports, Q, clamped to the ring by clamps O. After the thin coating of copper has been applied to the mould in the manner already described, the ring B, with the mould in it, is removed from the bath and turned over. The supports Q are then removed, and a ring such as P, Fig. 4, is applied to the mould to determine the size of the reflector. Or, instead of removing the supports Q and applying the ring P, if a ring such as N, Fig. 2, can be applied to the mould,

it is then replaced in the bath and the depositing continued. As soon as the requisite thickness of metal has been deposited, the mould, with the reflector attached to it, is removed from the ring B and placed in a bath of cold or lukewarm water, which is then raised to a temperature of 120° Fahr., whereupon, owing to the difference of expansion of the glass mould and the metal backing, the latter separates from the mould. The only thing that requires to be done now is to coat the reflector with an untarnishable metal. This is accomplished by placing the reflector in an earthenware pan (Fig. 7) containing a 0.62 per cent. solution of palladium ammonium chloride in about a 1 per cent. solution of

FIG. 7.

ammonium chloride. The solution is used at about 75° Fahr., the current used for a 2-foot reflector being about 0.5 of an ampere, the EMF. at the terminals of the bath being 4 to 5 volts. An anode, S, made out of carbon, and curved approximately the shape of the reflector, is attached to a rod marked T, which is connected by an arm to a rotating disk which causes the anode to swing to and fro, thereby ensuring an even coating of palladium, and agitating the solution and preventing the depositing upon the reflector of particles of foreign matter which may be present in the solution.

The back of the reflector is usually varnished before placing it in the bath, to prevent local action setting up between the copper and the silver or palladium. The reflector is removed from the bath and dipped in boiling water, and then placed in box-wood sawdust, which is kept hot by means of a steam jacket. The reflector is then ready to be mounted in a suitable ring, such as shown in Figs. 8, 9, 10, 11 and 12. The clamping ring shown in Fig. 8 is provided with a knife-edge, marked F, Figs. 10 and 12. The knife-edge forces the reflector against a ring of

asbestos, marked G, and retains it in position after the reflector has been carefully centred whilst resting on the asbestos ring.

Reflectors made by the process which has just been

FIG. 8.

FIG. 9.

described have been subjected to a number of tests, and found to withstand excessive heat without tarnishing. Salt water has been thrown on the reflectors when they have been too hot to touch, the result being that the water was driven off as steam, and the salt left as a white deposit on the reflector, which was easily removed with a wet cloth.

A reflector recently tested at Portsmouth had a number of rifle bullets passed through it, when the beam was found to be little affected. On the other hand, the first shot fired at a glass reflector splintered it to pieces.

Although palladium does not reflect light as well

FIG. 10.

FIG. 11.

FIG. 12.

as a silver surface which is perfectly clean and bright, silver is found quite unsuitable, as after being in close proximity to an arc light for a short time the silver tarnishes, and the light is greatly reduced in intensity. With a palladium-faced reflector the intensity of light is found to remain practically constant, as little or no tarnishing takes place.

Some of the reflectors have been tested optically by the process which has been extensively used by Thikolff. The method consists of photographing the image in a reflector of a white screen covered with black square network, as shown in Fig. 13. The screen is of white material having a black square network, the lines being 0.2 inch thick and 0.6 inch apart. In the center of the screen a square opening is left, through which the photograph of the image of the network is taken. The first steps in the process are as follows: The reflector is placed at a distance of from 3 to 5 feet from the screen, which

FIG. 13.

should exceed by at least 35 per cent. the height and breadth of the reflector, so as to ensure the image of the network covering the whole surface of the mirror. The test of the reflector is carried out as follows:

The surface of the mirror in all planes is tried by a template, to ensure that the exterior curves of the surface are not far distant from the parabola; the image on the screen is then photographed, and the irregularity of the lines indicate any serious errors of the parabolic surface.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

THE ELECTRICAL EQUIPMENT OF THE MAINE.

An extended description of the electrical equipment of the battleship Maine, sunk at Havana, and perhaps the most talked of battleship in the world during the last three weeks, would be sufficiently large to fill a fair-sized volume.

At the Bureau of Electrical Equipment of the Navy Department, the following facts of interest to electricians generally were learned: In the first place, none of the wires were allowed to run near the magazines or rooms where the explosives were kept, and as the chief clerk of the Bureau remarked, the explosion could not possibly have proceeded from that source.

There were 4,200 feet of double length mains; total amperes, 248; carried amperes, 163½; 1,045 feet of double length feeders, total amperes, 225.

The lamps and attachments were as follows (they are divided for convenience into "battle" and "lighting"):

151 ten candle-power, 84 sixteen candle-power and 10 thirty-two candle-power lamps in the "battle" division, and 153 sixteen candle-power lamps in the "lighting" division. This makes a grand total of 398 lamps, with a total candle-power of 5,622.

There were 183 junction boxes in the "battle" department and 96 in the "lighting" department, a total of 279.

In the "lighting" department there were 33 outlets.

In the "battle" department there were 101 receptacles and in the "lighting" department 25, a total of 126.

There were 45 switches in the "battle" department and 18 in the "lighting" department, a total of 63.

Of sockets, there were 245 in the "battle" department and 153 in the "lighting" department, a total of 398.

In the "battle" department there were 231 fixtures and 149 in the "lighting" department, a total of 380.

In addition to these were two large searchlights, one fore and one aft.

There were two dynamos and engines directly connected and secured to the same bedplates. The bedplates were made as light as practicable consistent with necessary strength and rigidity, and had suitable provision for securing tachometers and for catching the waste oil. The dynamos were connected to a switchboard from which all of the circuits for incandescent lamps and motors were supplied, and the motors and incandescent lamps could be operated at the same time. A ground detector and two direct-reading voltmeters were supplied with the plant.

The cylinders and other parts subject to steam pressure were guaranteed to successfully withstand a water pressure of 200 pounds per square inch, and to bear without injury the removal of the entire load by suddenly breaking the external circuit of the dynamos.

The engines were two-cylinder, double-acting, not compounded, direct-acting, and vertical, and were directly connected to the armature shafts by means of flexible couplings, and were capable of driving them at a speed of 500 revolutions per min-

ute when the dynamos were generating their maximum output. The initial steam pressure was 60 pounds, exhaust either atmospheric or vacuum.

The engines were fitted with the most efficient kind of lubricating devices and guards to catch flying oil.

The dynamos were compound wound and self-regulating, producing with 500 revolutions of the armature per minute a constant electromotive force of 80 volts measured at the terminals. Under these conditions each dynamo had a capacity of 25 amperes, and within these limits there was only a variation of $1\frac{1}{2}$ per cent. in speed at load to produce the required electromotive force.

There was no single wire larger than No. 14 B. W. G. used in the wiring, and it had to conform to the Naval standards in such cases.

The incandescent lamps were arranged in six sections from the main switchboard.

mitters were located in the engine rooms and the indicating dials in the conning tower and on the bridge or in the chart house.

A direct reading rudder transmitter showed the angle of the rudder with the keel and was connected with dials placed on the bridge at the steering engine and in the conning tower. This angle was shown at all the stations on the same instant.

There were also heeling indicators to show the angle of heel and the angle of roll and were located in the chart house and two other places on the upper deck. The dials of all the telegraphs and indicators were lighted by electricity and the necessary energy was supplied for the instruments from the dynamo circuits. There was a reserve battery for use in case the dynamos were not in operation.

There were thirty-three voice pipes or telephones on board the ship, eleven buzzers, two bells, two gongs, an automatic water alarm circuit and twelve

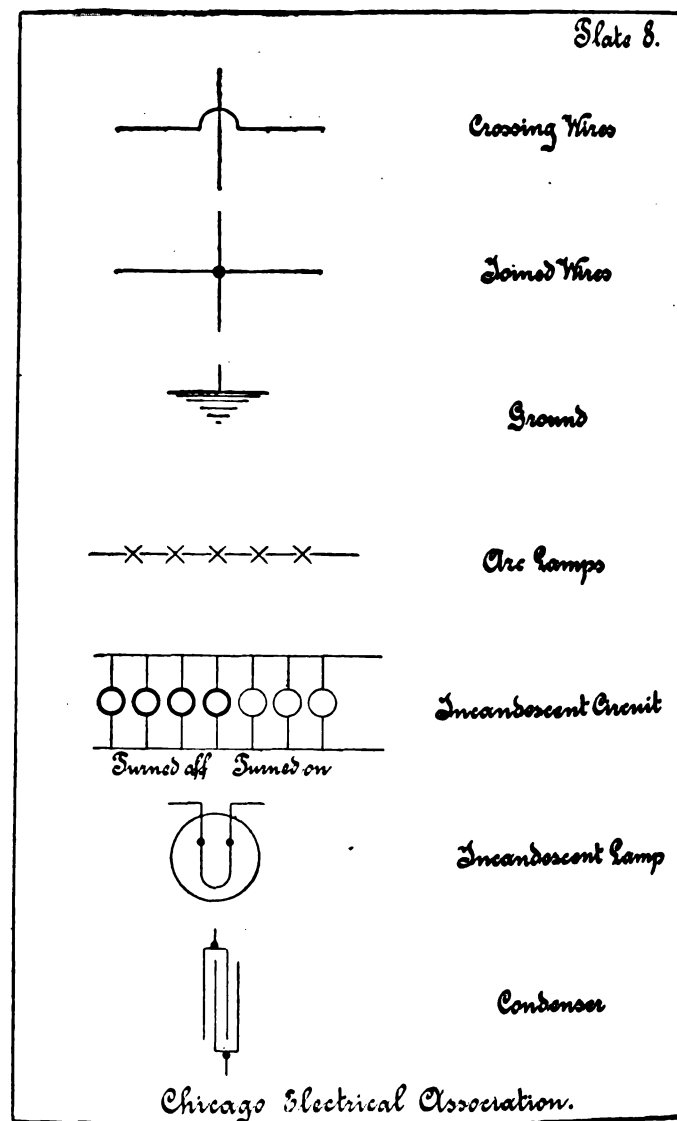

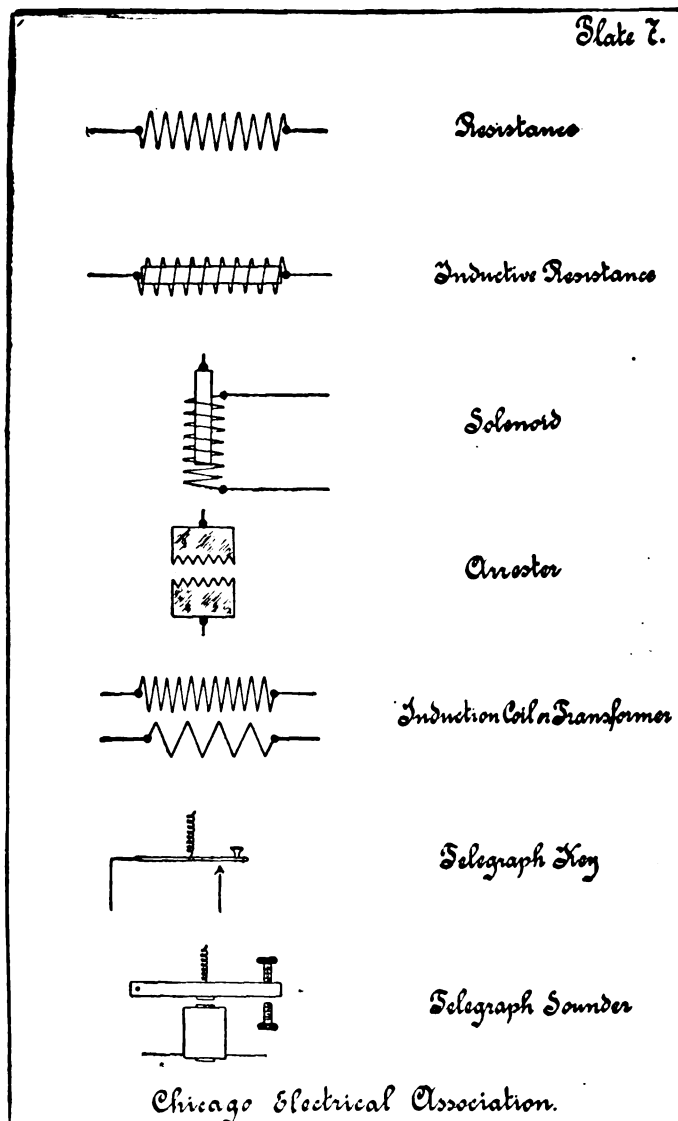

STANDARD SYSTEM OF ELECTRICAL DIAGRAMS.

(Concluded from page 119.)

The distinction between the ordinary resistance and inductive resistance as shown in Plate 7 is both simple and suggestive, the presence of the core inside of the coil conveying to the mind the presence of a certain amount of self-induction.

The use of two parallel zigzag lines for induction coils or transformers lends itself readily to the distinction between the primary and secondary, between the step-up and step-down transformers, and, moreover, its construction is of such a simple nature that it was chosen without hesitation by the committee from among dozens of other good diagrams for representing the same apparatus.

In the telegraph sounder the magnet coil has been represented in outline. In this connection it may

There were three electric motors installed on board, with an aggregate of four horse-power. Each motor was directly connected to a countershaft and had a constant speed of 150 revolutions per minute, and was self-regulating and reversible.

There were electrical telegraphs with dials in each engine room and connected to transmitters in the conning tower and in the chart house (or on the bridge), whereby the number of engine revolutions desired could be easily transmitted. These telegraphs were so constructed that messages could be repeated back from the engine room. There were telegraphs of the same character with repeating dials at all steering wheels and steering engine and connected in the same manner as the engine room instruments, and were so constructed that at all stations the angle was indicated at the same moment.

The indicators were direct reading electrical indicators and showed the direction and number of revolutions of each of the main engines. The trans-

ten-inch clockwork alarm gongs with electrical escapements, five on the berth deck, two in the ward-room, one in the junior officers' quarters, one under the forecabin and one on the main deck under the middle superstructure.

Roentgen-Ray Work in English Hospitals.

The X-rays are being very extensively used in surgical and other work in the hospitals in London. During the year 1897 as many as 416 patients were examined in the X-rays department of St. Thomas's Hospital, Albert Embankment, and the increased work has made necessary the appointment of another assistant in that department. At a Liverpool hospital during the past twelve months fifty-seven cases were facilitated by the same kind of treatment.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

be said that where it is not essential to know the nature of the winding or the direction of the convolutions, this same form of magnet might be adopted in any of the relays or annunciators used elsewhere in these diagrams.

The selection of a symbol for "a ground" which might be universally accepted is apparent. The custom of some artists of placing palm trees and grass, or the drawing of miniature landscapes surrounding their ground wire, may add somewhat to the artistic effect, but certainly nothing to the clearness or merit of their work.

In conclusion it may be said that it is believed that where any particular piece of apparatus is to be presented for which no specific diagram is here found, it will be an easy matter for the person desiring such diagram to make it from the elements here shown.

By the official adoption of these diagrams by a recognized body of electrical men, a standard of uniformity is presented to the public. The committee realizes that this list is not complete, but hopes that

it will be a nucleus of a uniform symbolic language among electricians.

The committee, from whose report we have abstracted the remarks accompanying the plates, was composed of Thomas G. Grier, Kempster B. Miller and C. Wiler.

A SPECIAL PRIZE OFFER.

Theses Competition for Students.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to *ELECTRICITY*.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For Electricity's Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of *ELECTRICITY*, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and wherever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of *ELECTRICITY* duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all theses submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of *ELECTRICITY*, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we should like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not thoroughly clear, we will be pleased to answer any inquiries relating to this matter.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

PROPOSALS INVITED.

The United States Navy Department, through the Bureau of Supplies and Accounts, is inviting sealed proposals until March 29, 1898, for all the labor and material for supplying an electrical installation for the experimental model basin now being equipped at the Washington Navy Yard. The object of the installation is to supply the necessary power for driving a model towing carriage at various uniform speeds, from the slowest up to an actual speed of not less than 2,000 feet per minute. The Government will supply the model towing carriage, exclusive of driving motors and all other electrical attachments. In the installation of the plant, the Government will prepare the foundations, will make the necessary steam connections, and will plant the necessary outside poles for carrying electrical circuits. All other work, including generators, engines, motors, switchboards, instruments, all wiring, etc., must be supplied and installed by the contractors. The motors must be designed in conformity to the space shown to be available on towing carriage plans, an increased length of motor only being permissible, provided a suitable rearrangement of bearings can be made without interfering with other parts shown on the plans. They must be wound for a maximum voltage of 250, and at this voltage, with all four motors acting through the gearing shown on plans, must develop the necessary power for attaining the highest speed as specified, the speed of armature being about 800 r. p. m. Motors are to be controlled on the Ward Leonard system or one similar in results and efficiency. The fields of each motor to be provided with a rheostat, and a Weston ammeter and voltmeter to be connected in the armature circuit of each, and also in the main circuit. The generators for supplying the necessary current to be preferably in two similar units and of ample size to supply the maximum power referred to when running in parallel. A third machine to be provided for separate excitation, with surplus capacity for lights up to 1,000 CP. Generators are to be of the multipolar direct connected type, both generator proper and engine to be of standard approved pattern. The engines are to be of the direct-acting, non-condensing type, specially constructed to receive the generators. Contractors will be expected to supply the switchboard in power station, to supply material for and do all necessary wiring in connection with the complete installation as well as supply and install all the conductors in the building. The wiring between buildings will be overhead work and the Government will supply and plant the necessary poles.

Prospective bidders desiring specifications, blank forms of proposals, and any information considered essential, in addition to that contained herein, can obtain same upon application to the Paymaster General, U. S. Navy, Washington, D. C.

The Telegraphic Tournament.

Regarding the Telegraphic Tournament to be held during the Electrical Exposition in Madison Square Garden next May, and which we referred to at some length in a recent issue of *ELECTRICITY*, it is said that Mr. Thomas A. Edison, who always takes great interest in contests of this nature, will make a phonographic record of the best transmissions, noting the exact time of the revolutions of the machine in order that perfect reproductions can be made at any future time. This will enable the contestants at any time thereafter to listen to the click of the key used in the tournament. It is announced that the matter to be transmitted to the tournament will be the same as that used in the 1893 tournament. In the first 260 words of this matter there are 14 periods, 16 commas, 2 colons, 3 paragraphs, 1 hyphen, 1 dash, 1 interrogation, 1 initial quotation and 1 end quotation.

The rules governing the tournament provide that an omission or addition of any telegraphic character in the matter transmitted shall constitute an error.

As this tournament is to be conducted under the auspices of the New York Electrical Society, its success is practically assured.

Those wishing to communicate with Mr. Fred. Catlin, manager of the tournament, can do so by addressing him, Post Office box 2403, New York.

LEGAL NOTES.

The recently decided case of *Blauvelt vs. Interior Conduit & Insulation Company*, which was a suit in equity by James M. S. Blauvelt, trustee, against the above-named company to restrain the alleged infringement of a patent, touches on a point that is of importance to all men employing laborers. The following extract from the decision of the Circuit Court for the Southern District of New York sufficiently shows the facts and the decision in the case: "The case is, therefore, that of an inventor, who, as a workman in the employ of another, manufactures for him, in his shop, and with his materials, and upon weekly wages, machines which the employer uses as a part of his tools, without knowledge of any objection thereto, and for which the inventor, during the term of his employment, obtains a patent, and thereafter seeks to restrain the employer from the use of the particular machine or machines which had been thus made in the employer's shop under the supervision of the employee, and apparently as a part of his ordinary work. The subject is the same as in the case of *Gill vs. United States*, 160 U. S., 426; 16 S. Ct., 322. The Court said the case raised the question, which has been several times presented to this court, whether an employee paid by salary or wages, who devises an improved method of doing his work, using the property or labor of his employer to put his invention into practical form, and assenting to the use of such improvements by his employer, may, by taking out a patent upon such an invention, recover a royalty or other compensation for such use. In a series of cases, to which fuller reference will be made hereafter, we have held this could not be done." The Court further said that the principle upon which all the decisions were based is "an application or outgrowth of the law of estoppel in pais."

THE NEWS.

What is Going On in the Electrical World.

STREET RAILROADS.

Agawam, Mass.—The selectmen have extended to March 15 the time in which the Springfield & Southwestern Street Railway Company must be incorporated or forfeit the franchise. The board has informed the company that no further extension of time will be given.

Akron, O.—The receivers of the Akron Street Railway & Illuminating Company have been given authority to improve the local system by building additional tracks and purchasing new cars.

Birmingham, Ala.—The Birmingham Traction Company, which several months ago obtained control of the East Birmingham dummy line running from Birmingham to Gate City, and has converted it into an electric road, has now come into possession of the North Birmingham dummy line, which runs from Birmingham to North Birmingham, a distance of five miles, and will equip it with electricity also, and operate the two properties in conjunction. Together the roads penetrate the most thickly settled suburbs of the city. A large power house, nearly completed, will furnish electricity for the system.

Buffalo, N. Y.—The Buffalo Street Railway Company contemplates running trolley cars over to Canada if Senator Seibert's bill authorizing the enlargement of the International bridge across the Niagara River becomes a law. In this event connection would be made with the Canadian trolley line running down the west bank of the Niagara River to the Falls and Queenstown. The plan is to enlarge the International Bridge so that it will have a track for steam cars, a carriageway, and be of such a double decked construction as to permit of a trolley line in its second story.

Chester, Pa.—The Chester Traction Company are making preparations to begin work on the short sections of road that are needed to give them a through line between Wilmington and Philadelphia.

Detroit, Mich.—Hon. J. E. Sawyer of Pontiac, who was in this city a few days ago, says that financial backing from an Eastern syndicate has been secured for the proposed Pontiac and Flint electric railroad. The road will be 4 miles long, passing through Drayton Plains, Waterford, Clarkston, Ortonville, Goodrich, Atlas and Grand Blanc. It will cost \$500,000. Mr. Sawyer says franchises from the various townships and villages along the route have been obtained and the work of construction

ion will begin as early in the spring as possible. The new road will be incorporated in a few days.

Hellertown, Pa.—The supervisors of Saucon township have granted to Pascoe & Crilly right of way for an electric road from Hellertown to Freemansburg, running through Northampton Heights.

Kansas City, Mo.—The Northeast Electric Railway Company has decided to expend \$100,000 this spring on a new track, new cars and an increase in the power facilities of its electric plant. Roland R. Conklin, vice-president of the North American Trust Company of New York City, which owns nearly all of the stock of the Northeast road, has been here examining the system, and decided that \$100,000 could be spent with profit on new equipment and general repairs for the road.

Meriden, Conn.—Francis Atwater and J. A. Hurley of the Meriden & Southington Tramway Company have deposited a bond of \$1,000 with the borough officials at Southington that the road would be begun by March 31 and completed by August 1.

Mt. Holly, N. J.—The board of freeholders will give a hearing at Mt. Holly on April 5 on the petition of the Monmouth Traction Company for right of way over the roads and bridges in Burlington county included in the proposed route.

New York.—The cable roads in 125th street and Tenth avenue will soon be equipped with electricity and afterward the main cable line of the Third Avenue Company will probably be thus equipped.

Newark, N. J.—The inhabitants of the townships of Caldwell, Livingston and Verona and the borough of Caldwell, whose efforts to secure trolley communication with Newark have so far been blocked by the refusal of the town council of Montclair to grant a franchise to lay tracks through that municipality, have now decided to appeal to the Legislature. Their proposed plan is the enactment of a law which shall give the board of freeholders the exclusive power to grant to traction companies and street railroads the right to lay their tracks upon the county roads.

New Rochelle, N. Y.—The board of trustees has granted the Union Electric Railroad Company of New York a franchise to construct and operate trolley lines over the local streets. The company immediately filed a bond for \$50,000. The franchise gives the right to operate electric cars from the New Haven Railroad station to Starin's Glen Island dock and thence to Larchmont Manor; also a line to Pelham, which will connect there with the present Mount Vernon line, giving the company a through route from Larchmont to 129th street, New York.

Parkersburg, W. Va.—At a recent meeting of the stockholders of the Parkersburg Electric Light & Street Railway Company the contract for building the entire new street railway system was let to L. G. Hallock & Co., of Wheeling, work to begin before the middle of March. The contract price was about \$100,000.

Sandusky, O.—A new electric railroad is being projected which will connect this city with Port Clinton, Castalia, Bellevue and Clyde. The incorporators of the new company are Clark Rude, F. P. Zollinger, A. J. Peters, G. O. French and W. E. Guerin, Jr.

Sheboygan, Wis.—The project for an electric railway line between Sheboygan and Sheboygan Falls has been revived, and there is a strong probability that the road will be constructed and put in operation the coming summer. The greater part of the right-of-way has been secured. The line will be an extension of the Sheboygan electric railway line and will be built by John M. Seaman.

St. Louis.—Mayor Zeigenheim has vetoed the North and South Railroad ordinance and the House of Delegates failed in the attempt to pass it over the veto.

St. John's, N. F.—The Governor has signed the Reid railway contract, which gives Mr. Reid the right to build a railway across Newfoundland and to work the entire railway system of 650 miles for fifty years, with a bonus of 2,500 acres of land for each mile. Mr. Reid agrees to purchase the Government telegraph lines, to run seven mail steamers, build an electric railway at St. John's, and pave the streets of the city. The contract represents \$15,000,000 to the colony and probably many more millions to Mr. Reid.

Washington, D. C.—The amended bill authorizing the Capitol Railway Company to use the overhead trolley on the Navy Yard bridge, which has been acted upon favorably by the House District Committee, will provide that a double trolley shall be used.

Webster, Mass.—The capital stock of the Worcester & Webster Street Railway Company, \$200,000, has been fully subscribed, a large banking house in New York taking \$150,000 of the amount. Everything is now accomplished but the locations in the towns along the route and no trouble is anticipated in obtaining these.

Worcester, Mass.—The "Telegram" says: "A promising sign of spring is the activity of the new electric railway companies and promoters who want to build roads from Worcester into the country. If all the plants under way are put through, Worcester will be a great center of street railway construction and will be provided with unsurpassed facilities to bring in the trade of suburban districts."—The Worcester, Milford, Attleboro & Woonsocket Street Railway Company has applied to the Legislature for a charter and representatives of the company were given a hearing before the railroad committee a few days ago. The line from Worcester to Woonsocket would be 43 miles long, but the company will probably arrange for connections with roads already in operation along portions of the line. Several shorter lines having Worcester as a terminal are projected.

LIGHTING PLANTS.

Bangor, Wis.—A stock company has been organized to put in an electric light plant in this city.

Boston, Mass.—The Senate bill to enable cities and towns to manufacture and distribute gas and electricity for municipal purposes, reported upon adversely by the committee on manufactures, was tabled by a vote of 13 to 1. Another adverse report of the committee on manufactures, on the petition of the mayor of Boston, for the right to own and operate electric-light plants for the purpose of supplying public buildings and parks, was also tabled.

Buffalo, N. Y.—The Buffalo General Electric Company has decided on the old Wilkinson street station as a site for the new station of the company. The old station will be remodelled and equipped with modern machinery at a cost of \$200,000.

Des Moines, Ia.—An election is to be held here on the 28th inst., and one of the questions to be decided is whether the McCaskey & Holcomb contract for a municipal lighting plant, made on the 3d of August last, shall be carried out. The courts decided that the contract was invalid on account of some illegality in the council's action in awarding it.

Grand Rapids, Mich.—Nagel & Ball, electrical engineers of Chicago, have been awarded the contract by the board of public works for superintending the erection of the new municipal electric lighting plant, which is to be built immediately. The contract price for their supervision is \$5,000.

Greensburg, Pa.—Southeast Greensburg borough will probably have electric lights at an early day as the new borough council is in favor of providing the town with a plant.

Gridley, Ill.—I. G. Holdridge and J. F. Lusher have been granted a franchise to maintain an electric light and power plant in this village.

Lewiston, Idaho.—The Lewiston Light Company has effected a reorganization, increasing the capital stock of the company from \$10,000 to \$30,000. The growing demands for lights have necessitated increased power, and the company has decided to establish a power plant on the Asotin creek, two miles above Asotin City, in Washington. The company will also supply Asotin City with lights.

Pine Bluff, Ark.—A proposition has been made to the city council to establish an electric lighting system and street railway in this city which will probably be accepted.

Watervliet, N. Y.—The taxpayers at the election on the 2d inst. voted in favor of appropriating \$16,000 for the enlargement and improvement of the electric light plant.

Woodstown, N. J.—The spring election will decide whether this town is to have electric lights or not, as the vote for candidates will hinge principally upon this question.

TRANSMISSION PLANTS.

Albany.—Senator Daley has introduced a bill in the Senate to incorporate the Jansens Kil Electric Power Company of Hudson, and Mr. Hoos has presented the same in the Assembly. The incorporators named are William A. Harder, Jr., Philip M. Harder and Charles N. Harder, and such other persons as they may associate with them. The purpose is to construct, maintain and operate a series of dams or reservoirs on the Roeliff-Jansens Kil and its tributaries in the counties of Columbia and Dutchess, N. Y., for the purpose of the development of power and for the purpose of furnishing hydraulic and electrical power for manufacturing and other uses, and transmitting such power to a distance by electricity and other means to the city of Hudson and intermediate places in the counties of Columbia and Dutchess. The capital stock of the corporation is \$100,000, divided into shares of \$100 each. The company is authorized to increase its capital stock, but not to exceed \$250,000.

Cripple Creek, Col.—President D. V. Donaldson of the Colorado Electric Power Company says his company will be prepared to furnish power to Cripple Creek miles by the latter part of the month. The structural iron for the main power building has already arrived in Canon City, where the main plant is to be located, and the work of stringing the wires is almost completed.

Saratoga, N. Y.—A syndicate of New York and Saratoga capitalists has purchased, at a cost of \$60,000, the land in the vicinity of Hell Gate Rapids, on the upper Hudson, about seven miles above Glens Falls. The intention is to utilize the great water power at that point as the motive power for a mammoth electrical plant. A dam and power house are to be erected, and, with electricity generated therein, a railroad, to be known as the Saratoga Northern, running between Saratoga and South Glens Falls, will be operated. This road will have branches to intermediate points and also to Glens Falls, Sandy Hill and Fort Edward.

Waterbury, Conn.—There is a scheme on foot to harness the Housatonic River at Shelton, or improve the facilities already there, for the purpose of getting water power to operate an immense electric plant which would supply electricity to all the factories and trolley lines in the State west of the Connecticut River. The Housatonic Water Company of Bridgeport owns the water privileges at Shelton and has a dam there 150 yards long and 25 feet high, and the water power is said to be inexhaustible. It is said the new company intends, if possible, to buy out the Housatonic Company, and supply

electric power to manufactories and mills that have depended for a quarter of a century on the power furnished by the water company.

MANUFACTURING, ETC.

Trenton, N. J.—The bill providing that insulators for electric lights and trolley wires shall be of red glass was reported adversely in the Assembly, but the adverse report was non-concurred in and the bill was placed on the calendar.

New York.—A Cortlandt street firm closed a contract last week for a medium size electric light and power plant for an interior town in Brazil. The contract price was \$18,000.

Indianapolis, Ind.—The Jenney Electric Motor Company has been reorganized and will at once begin rebuilding a plant in this city on a larger scale than that of the plant destroyed by fire.

COMPANY MATTERS.

Lynchburg, Va.—The electric lighting, power and street railway plant, including five and a-half miles of track and valuable franchises, of the Lynchburg Electric Company, were sold at auction on the 28th ult., by commissioners appointed by the United States Circuit Court, for \$31,500 to Walter S. Johnston and R. A. C. Smith, trustees, of New York, for the bondholders there. It is said that the new owners will shortly re-equip the line and put the plant in first-class condition.

Nashville, Tenn.—The resolution providing for the consolidation of the Union Light & Power Company and the Cumberland Electric Light Company, submitted by the special committee with a recommendation of approval, was adopted by the city council.

Providence, R. I.—The act to incorporate the Cumberland Street Railway Company has passed both houses of the Legislature. The company will establish a street car line between Lonsdale and Cumberland Hill.

Richmond, Va.—The bill to incorporate the Harper's Ferry Power Company and the bill to incorporate the Botetourt Electric Railway & Power Company have become laws without the signature of the Governor, owing to the expiration of the statutory limit.—The Governor has affixed his signature to the bill providing for submission to the voters of Grayson County the question of a subscription to the capital stock of the Grayson & Carroll Electric Railway Company.

NOTES FROM A CORRESPONDENT.

Troy, N. Y.—The contract for lighting the streets of the city by electricity for three years has been awarded to the Troy Gas Company, the prices to be for the first year 37½ cents per lamp per night, for the second year 36½ cents per lamp and for the third year 35½ cents per lamp per night. To the same company has been awarded the contract for electric light in the city buildings at ½ cent per ampere hour.

Rensselaer, N. Y.—The common council has extended the time of the Kinderhook Light and Power Company for commencing their service with the city until April 1.

Albany, N. Y.—Maxwell S. Cooley of Kings Park has been appointed chief electrical engineer at Clinton Prison and R. G. Elliott of Avon has been appointed assistant electrical engineer at the same place.

PERSONAL AND MISCELLANEA.

The "Post Express" of Rochester, N. Y., referring to F. W. Hawley, vice-president of the Cataract General Electric Company, for whom a receiver has been appointed by the court, says: "Hawley was a newspaper man in this city a few years ago. He started out without a cent and is now said to owe banks and other corporations over \$100,000."

A special cable dispatch from London, March 4 to the N. Y. "Sun" states that the Vienna correspondent of the London "Daily Telegraph" says that Szczepanik, the inventor of the Fernseher, an electrical teleoptical apparatus which enables any one to see an object in its natural colors no matter at what distance it is away, has sold the right for the public exhibition of the apparatus and all subsequent rights in France to the directorate of the Paris Exhibition of 1900 for the sum of 6,000,000 francs (\$1,200,000).

The Hartford (Conn.) Electric Light Company has secured 150 clocks to regulate the arc street lights that have an alternating current. The time desired for the lamp to be lighted at night and extinguished in the morning is indicated on the dial. When the clock hand catches a certain point it makes a connection and the lamp is lighted. The hand continues to move and when it reaches another point it breaks the connection and the light goes out.

Some citizens of Montclair, N. J., anxious for a new form of entertainment, hit upon what they called a "telephone symposium." They arranged for special quick connections and then listened to short speeches, songs and jokes from a dozen different parts of the country. There was a regular time schedule and the range of the entertainment extended to widely separated points. It proved quite successful and showed the possibilities in undeveloped fields of telephone use.

Dennis Doren, the general superintendent of the Construction Department of the Western Union Telegraph Company, died at Norwalk, O., on the 25th ult., of apoplexy. Mr. Doren was born February 13, 1830, and began work in the Construction Department of the

Western Union Telegraph Company at the age of twenty years. He became president of the American Cable Construction Company in 1881, and held the position during the time the two Atlantic cables were leased to the Western Union Telegraph Company. He was made superintendent of the Construction Department of the Western Union office in 1881.

Manager John I. Beggs of the Milwaukee Electric Railway & Light Company had a narrow escape from being killed on the 22d ult. A large chunk of ice fell from the roof of a building he was passing in Milwaukee and struck him on the head, severely bruising his scalp and giving him a shock that rendered him unconscious for some moments. The Milwaukee "Sentinel," in its account of the accident, says: "The ice struck him squarely upon the head, instead of giving him a glancing blow, and to this Mr. Beggs attributed his fortunate escape from permanent injury. As it was, his hat was torn completely in two. Even the hatband inside was torn across, and his scalp was severely bruised. 'I have been thrown off coal trains, and have suffered a good many hard knocks,' said Mr. Beggs, in speaking of the accident, 'but I never got a blow in my life that left me so completely limp. It may have been my short neck or the shape of my head that saved me from serious injury, but I am sure that the blow would have killed a woman or child, and perhaps many another man.' Mr. Beggs has the hat in his closet, and will keep it as a memento."

A. Werner, a well-known silversmith of Milwaukee, has discovered a method by which signs, pictures and drawings can be made by the combined use of photography and electricity, and the invention may cause a revolution in the art of engraving. He has been experimenting for ten years and has just discovered the method. His process as described in the Milwaukee "Wisconsin" is as follows: "In the first place a drawing must be made of the sign or plate. This drawing is photographed and the photograph transferred to a metal plate, which may be of zinc, brass, copper, bronze, silver or any other metal. This metal plate is then hung on a copper wire into a so-called bath, and an electric current turned on. In a few seconds a copy of the lead pencil drawing is etched into the metal, deep enough to be visible for a hundred years. Then the plate is conveyed to another bath and again connected with the electric current. At this moment the indentures begin to fill with jet black matter until they appear almost even with the surface of the plate. The plate is then washed, dried and varnished with a coating expressly prepared for this purpose. This protects it and saves the trouble of polishing. Signs which are exposed continually to the weather require deep etching and heavy enameling, so that they can be cleaned without injuring the surface. The same process may be applied to pictures and pen drawings, and the copies will last for a thousand years, leaving the contours of the face, etc., sharp and distinct."

RECENT COMPANY ELECTIONS.

Ridgewood Electric Light Company, Ridgewood, N. J.—Directors: H. S. Paterson, H. A. Dunbar, Edwin Clark, D. W. LaFetra, E. A. Walton, John Wilson, Thos. Watlington, E. Le B. Gardiner and J. F. Carrigan.

Tarrytown, White Plains & Mamaroneck Railway Company, formerly the New York, Elmsford & White Plains Company—President, David Cromwell; secretary and treasurer, Herbert T. Jennings; directors: David Cromwell, Bradford Rhodes, Thomas B. Hodge, Clarence S. McClellan and John W. Loundsberry.

Union Railway Company ("Huckleberry"), New York.—Directors: Edward A. Maher, Henry Hart, John E. Parsons, Edward Lauterbach, Albert J. Ellis, Charles Remsen, Henry Iden, David C. Andrews and G. Howland Leavitt.

COMMERCIAL PARAGRAPHS.

Educate Your Bowels With Cascarets.
Candy Cathartic, cure constipation forever.
10c, 25c. If C. C. C. fail, druggists refund money.

The Beautiful St. John's River.

The Clyde Line, operating steamers between New York, Charleston and Jacksonville, Fla., in connection with Clyde's St. John's River line, announce that on the 16th inst. they commenced running the well-known steamers between Jacksonville, Palatka, Sanford, Enterprise and intermediate points, leaving Jacksonville daily (except Saturdays). Returning these steamers leave the various landings daily (except Sundays) for Jacksonville, where connection is made with the Clyde Line steamers for the North. Heretofore the service on the St. John's River has been tri-weekly.

This interesting news will be hailed with delight by the numerous tourists and pleasure seekers who annually take in this delightful trip up the St. John's River.

The beauties of the St. John's River have been heralded far and wide, and there are few Northerners who do not know of at least some of the attractions located on the banks of this river the course of which is directed through the most tropical portion of Florida.

In this section are located hundreds of boarding houses and hotels where the choicest of Southern delicacies may be had.

The Clyde Line does the largest passenger business of any steamer line between New York and the South, and the company has recently issued some very interesting literature, which it is sending out gratis to applicants.

By addressing a communication to the Clyde Line, 5

Bowling Green, New York, our readers will in return be rewarded with some exceedingly attractive advertising matter regarding Southern resorts.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

An Improved Sand Box.

The Ham Sand Box, illustrated herewith and sold by the Electric Appliance Company of Chicago, is based upon the theory that any box provided with a valve at its bottom is impracticable, and if the valve be made tight enough to prevent the sand from sifting through it will require great force to operate it, while if the valve be loose enough to work easily it will allow the sand to sift around it. The company also claims that if a pebble get into the valve slide it will hold it open so that the sand will run out of the box.

In the No. 8 Ham Sand Box illustrated, all parts are made of bronze metal. It has an opening in the box, under which is a curved shelf. The ends of the shelf extend beyond and above the opening in the box, so the sand cannot escape by gravity. A paddle is reciprocated above the shelf, and the movement of the paddle forces the sand in

SAND BOX COMPLETE AND IN SECTION.

each direction alternately over the ends of the shelf to the feed spout which leads to the car track. Above the paddle are two fingers which stir the sand. The connecting rod passes forward to the car platform, and is operated by a pin and bell crank lever, or by a hand lever. The working parts are extremely simple and the motions direct. The strokes of the foot or hand may follow each other so rapidly as to practically secure a continuous, but small, stream of sand, a decided advantage in hill climbing. It can be easily seen that waste is impossible in this box, as the sand flows only when the lever is in motion, and the quantity of sand is regulated.

The sand hopper inside of the car and directly over the sand box may be made of any form desired. If the space under the seats is enclosed, a square soap box or any other cheap form of construction may be employed.

Small stones or other small substances will not interfere with the operations of this box, but will pass freely through it. In fact the company recommends coarse in preference to fine sand, even if it contains gravel stones as large as peas, as it is less likely to pack in the box.

The manufacturers state that they have unsolicited testimonials favorable to the box received from prominent railroad men.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

High Grade Electro-Magnets seem to be in great demand. The Varley Duplex Magnet Company, of 138 Seventh street, Jersey City, N. J., are said to be crowded with orders. This certainly speaks well for the quality of goods this firm is turning out.

INCORPORATIONS.

The Harvey Lake Electric Light, Heat & Power Company, Wilkes-Barre, Pa. Capital stock \$1,000.

The Nescopeck Electric Light Company, Nescopeck, Luzerne County, Pa. Capital stock, \$5,000.

The Tiffin, Fostoria & Eastern Electric Railway Company, Tiffin, O. Capital stock, \$175,000.

The Hampton & Amesbury Street Railway Company, Hampton, N. H.—to build and operate an electric railway from the village of Hampton, through Hampton Falls to the State line in Seabrook. Capital stock, 75,000.

The Jamestown Electric Light & Power Company, Jamestown, Cal. Capital stock, \$50,000. Incorporators: William A. Neville, John Ballard, W. H. Martin, W. Grant and R. B. Carpenter.

The Minneapolis & Anoka Electric Suburban Railway Company, Anoka, Minn. Capital stock, \$70,000. Incorporators: Henry Lee, I. A. Caswell, A. E. Giddings, Theodore Coleman, John Coleman, John Dunn, Hiram Thornton, O. L. Cutter and Frank Hart, all of Anoka.

The Wappler Electric Controller Company of Manhattan, Capital stock, \$3,000. Directors: R. Wappler, J. C. F. Jacoby, F. H. Wappler and Charles Foyer.

The New Kensington Street Railway Company of Westmoreland County, Pa. Capital stock, \$12,000. Incorporators: T. A. Mellon, Jr., W. L. Mellon, F. M. Ross, O. T. Marsh, W. S. Mitchell of Pittsburgh.

The Westfield Realty & Construction Company, a branch of the Midland Railroad Company, Richmond, Staten Island, N. Y.—to erect dwellings, factories, power houses, car barns, docks, railways, tramways and electric railroads. Capital stock, \$50,000, with \$100,000 subscribed. Incorporators: W. B. Rockwell, M. J. Wightman, J. C. Hitchcock, F. E. Bradley, C. M. Robinson, C. O. Ellis and M. C. Quimby.

The Queens Borough Electric Light & Power Company, Far Rockaway, N. Y.—to operate in Kings, Queens and Suffolk counties Capital stock, \$250,000. Directors: Van Wyck Roselle, D. H. Valentine, Royal C. Peahody, C. L. Rosier, T. S. Williams of Brooklyn, Frank McGovern of New York City, Joseph O. Biglin of Far Rockaway, I. M. Sutton of Flushing and H. Hobart Porter, Jr., of Lawrence.

The Ewing Passenger Railway Company—to operate a street railway in Ewing township, N. J.—has filed a certificate of incorporation with the Secretary of State at Trenton. Capital stock, \$12,500. Incorporators: Henry C. Moore, R. S. Woodruff, B. Frank Abbott, Peter E. Hurley, J. H. Solomon, W. S. Gulick and F. P. Nippers.

The Huguenot Electric Street Railroad Company of Westchester County, New York City—to build and operate a belt street railway about 11 miles long having its terminus in New Rochelle. Capital stock, \$110,000. Directors: Louis K. Fries, Jacob M. Schuyler, James H. Burchell, Nathaniel J. Burchell, New Rochelle; George G. Dwyer, D. W. Webster, William H. Miller, John A. Cass, A. B. Linderman, Frank E. Wiggins, John A. Van Rensselaer, Ephraim Miller, M. B. Faulkner, George C. Reuwer and E. R. Brevoort.

The Bolton Falls Electric Company, Bolton Falls, Vt.—to erect a plant to supply Waterbury with electricity for power and lighting. Capital stock, \$75,000. Incorporators: George H. Almon of Montpelier, C. I. McMahon of Stowe, G. E. Moody, F. W. Randall, C. C. Warren and C. D. Robinson of Waterbury, Vt.

The Robertson Pneumatic Electric Transmitting Company, Aberdeen, Ia.—Capital stock, \$5,000,000. Incorporators: A. J. Robertson, C. T. Carr, Chicago; C. T. Easton, Aberdeen.

The Greenbrier Valley Construction Company, Grafton, W. Va.—to construct railroads, telegraph and telephone lines, etc. Capital stock, \$2,000,000. Incorporators: Hon. John T. McGraw of Grafton; J. M. Beckley, E. M. Upton and Thomas R. Lewis of Rochester, N. Y., and Charles M. Warner of Syracuse, N. Y.

The Standard Electric Company, Binghamton, N. Y.—to purchase, sell and install electrical and mechanical devices and appliances and to engage in mechanical engineering and construction. Capital stock, \$5,000. Directors: C. F. Terhune, L. M. Blanding and R. E. Prince.

The Manaois Railway Company filed articles of incorporation at Albany, N. Y., on the 25th ult. the purpose of the company being to construct and operate a steam or electric railroad line in the city of Manaois and elsewhere in the State of Amazonas, Brazil. Capital stock, \$500,000. Directors: A. J. Maham, Lorain, Ohio; M. N. Brady of Albany; E. O. Mayham, O. R. Flint, W. D. Walker and E. O. Converse of New York City; J. W. Scott of Orange, N. J.; F. R. Stewart of Brooklyn, and F. H. Hebblethwaite of Manaois, Brazil.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 1, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

599,766. Insulated Railway Joint. Peter Clark, Philadelphia, Pa. Filed May 21, 1897.

599,763. Rheostat. Sidney H. Short, Cleveland, O. Filed May 14, 1897.

599,807. Pneumatic Controlling Mechanism for Electric Railway Cars. Sidney H. Short, Cleveland, O. Filed Nov. 18, 1897.

599,828. Electric Railway. William M. Brown, Johnson, Pa., assignor to the Johnson Company, Lorain, O. Filed Oct. 7, 1897.

599,868. Electric-Car Trolley. William H. Russell, Newcastle, Canada. Filed April 18, 1896.

600,009. Third Rail. Lowell M. Maxham, Boston, Mass. Filed June 7, 1897.

600,101. Supply System for Electric Railways. David Urquhart and Frank Wynne, London, England. Filed Feb. 25, 1897.

599,770. Car Fender. Francis S. Davidge, Washington, D. C. Filed April 19, 1894.

599,920. Fender for Trolley-Cars. Otto Spreckenbach, New York City, assignor of one-half to August Trieb, same place. Filed Oct. 11, 1897.

600,099. Car Fender. Jakob W. Musman, New York City, assignor of one-half to Benjamin Bokey, same place. Filed Nov. 26, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 599,742. Apparatus for Visible Signaling. Leopold Seller, Vienna, Austria-Hungary. Filed March 28, 1896.
 599,819. Electric-Arc Lamp. Ernest P. Warner and Henry H. Wait, Chicago, Ill., assignors to the Western Electric Company, same place. Filed March 16, 1897.
 599,880. Electric-Arc Lamp. Christian Tepel, Bennett, Pa. Filed Dec. 31, 1896. Renewed Jan. 27, 1898.
 599,910. Incandescent Electric Lamp. John T. Lister, Cleveland, O. Filed Oct. 2, 1897.
 599,931. Electric-Arc Lamp. Harry P. Davis, Pittsburg, and Frank Conrad, Wilkensburg, Pa., assignors to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed Aug. 22, 1896.
 599,975. Portable Electric Lamp. Leonard Paget, New York City, assignor to David S. Ferris. Filed July 8, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 599,692. Electric Switch. George Doyle, Brookline, Mass. Filed Aug. 11, 1896.
 599,781. Current-Collecting Device. Ludwig Gutmann, Peoria, Ill. Filed April 26, 1897.
 599,784. Transformation of Alternating Currents into Direct Currents. Adolph Muller, Hagen, Germany. Filed July 30, 1897.
 599,791. Electric Motor. Oscar H. Pieper and Alphonse F. Pieper, Rochester, N. Y. Filed Oct. 17, 1896.
 599,801. Method of and Means for Controlling Electric Motors. Sidney H. Short, Cleveland, O. Filed May 19, 1897.
 599,805. Method of and Means for Controlling Electric Motors. Sidney H. Short, Cleveland, O. Original application filed May 19, 1897. Divided and this application filed Oct. 21, 1897.
 599,810. Alternating-Current Motor. William Stanley, Pittsfield, Mass., assignor to the General Electric Company of New York. Filed May 9, 1896. Renewed Nov. 17, 1897.
 599,815. Variopolar Motor or Dynamo. Henry H. Wait, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Aug. 20, 1896. Renewed July 29, 1897.
 599,892. Electric Regulator for Dynamos. William H. Chapman, Portland, Me., assignor to the Belknap Motor Company, same place. Filed Feb. 10, 1897.
 599,913. Electric Motor. Edmund McNeerney, Pittsfield, Mass. Filed May 22, 1897.
 599,918. Motor-Casing. Sidney H. Short, Cleveland, O. Filed Feb. 16, 1897.
 599,929. Quick-Break Switch. Harry P. Davis, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed July 22, 1897.
 599,940. Switch for Electric Circuits. Harry P. Davis, Pittsburg, and Ernest F. Harder, Wilkensburg, Pa., assignors to the Westinghouse Electric & Manufacturing Company, Pittsburg, Pa. Filed Oct. 28, 1896.
 599,932. Method of and Apparatus for Regulating Electric Motors. Budd Frankensfield and Dugald C. Jackson, Madison, Wis. Filed Jan. 28, 1897.
 599,910. Non-Synchronous Electric Motor. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company, same place. Filed April 30, 1897.
 599,941. Direct-Current Electrical Machine. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Original application filed May 8, 1896. Divided and this application filed July 8, 1897.
 599,942. Inductor-Dynamo. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed July 12, 1897.
 599,943. System of Electrical Distribution. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed Sept. 18, 1897.
 599,944. Switch for Electric Circuits. Gilbert Wright, Wilkensburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed Sept. 18, 1897.
 600,088. Current-Collector for Dynamo-Electric Machines. George W. Nell, Philadelphia, Pa. Filed Feb. 23, 1897.
 600,092. Electrically-Operated Hoisting Machinery. Anton J. Shaw, Muskegon, Mich., assignor to the Shaw Electric Crane Company, same place. Original application filed May 6, 1893. Divided and this application filed Jan. 16, 1894.
 600,112. Electric Switch. James J. Flint, Denver, Col., assignor to Flint & Lomax, same place. Filed Feb. 16, 1897.

ELECTRIC HEATERS, ETC.

- 600,057. Rheostat and Electric Heater. Henry P. Ball, Brooklyn, N. Y., assignor to the Ward Leonard Electric Company, Bronxville, N. Y. Filed Oct. 30, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

- 599,801. Toll-Collecting Device for Telephones. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 20, 1896.
 599,867. Telephone-Transmitter. James H. Rogers, Bladensburg, Md. Filed March 9, 1897.
 600,073. Telegraph-Table. John J. Hall, Slough, England, assignor to George Wilson Dawes, London, England. Filed Oct. 4, 1897.

MISCELLANEOUS.

- 599,718. Plate for Accumulators. Wilhelm Majert, Grunau, Germany. Filed Aug. 19, 1897.
 599,800. Automatic Electric Door-Closer. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 3, 1896.
 599,862. Electrically-Propelled Vessel. Daniel O'Flaherty, Kansas City, Mo. Filed May 12, 1897.
 599,881. Magnetic Closer. Joseph N. Thomas, Johnstown, Pa., assignor to the Johnson Company, Lorain, Ohio. Filed Oct. 19, 1897.
 599,891. Electric Contact Device. John L. Buchanan, Johnstown, Pa., assignor to the Steel Motor Company, same place. Filed Feb. 4, 1897.
 599,947. Electrically-Propelled Vehicle. Philip R. Salberg, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed Feb. 5, 1896.
 600,038. Flexible Electric Conductor. Antoine Bournonville, Philadelphia, Pa. Filed Nov. 20, 1897.

DESIGN.

- 23,327. Electric-Heater Case. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company, same place. Filed Nov. 2, 1895.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

TELEPHONE AND TELEGRAPH.

A Telephone Measure in the Iowa Legislature.

A telephone bill in the interest of independent companies has been introduced in the Iowa Legislature. The full text of the bill is as follows:

Section 1. That all telephone companies, or persons owning and operating any telephone exchange, or telephone line, for hire within this State, shall, at all points where such telephone lines enter or reach cities and towns within this State, where a local telephone exchange is maintained and operated, or where another telephone line or system is maintained and operated, arrange for and establish means of proper connection and communication with such local exchange or other telephone lines, and shall on request of any person without unreasonable delay, and without any additional charge therefor, furnish and make proper connection for communication by such person with any of the lines of said local exchange, or the lines of such other telephone system; provided, however, that this act shall not prohibit the collection of the regular charge for transmission of messages of communication over such telephone line or connecting line.

Sec. 3. Any telephone company or persons, owning and operating any telephone line or local telephone exchange, who shall refuse or fail to arrange for and grant connection and communication with a local telephone exchange, or other telephone line, as required in the preceding section, shall be subject to a penalty of fifty dollars for each failure or refusal, which penalty may be recovered by an action brought before any justice of the peace in the county where such failure or refusal is made, in the name of the State of Iowa and for the use and benefit of the school fund thereof.

It is said of Dennis Doren, general superintendent of construction of the Western Union Telegraph Company, who died recently at Norwalk, O., that when, during the civil war, Superintendent Eckert took charge of the military telegraph of the Department of the Potomac and put him in charge of the construction corps, he frequently put up a line and had it in working order as soon as military headquarters could be moved. He laid the cable from Cape Charles to Fortress Monroe, and the first message over it was the news that the Monitor had crippled the Merrimack. Mr. Doren was credited with having built and taken down on an average twenty-four miles of wire daily for the last two years of the war. He kept all corps headquarters in constant connection with the headquarters of Generals Grant and Meade. In July, 1866, his services were rewarded by the presentation to him of one of the twelve watches given by the Government to men who had performed meritorious and valuable service.

At the meeting of the directors of the Central West Virginia Telephone Association held at Clarksburg on February 26 reports were read showing a phenomenal growth of exchanges. The system now reaches half the counties in the State, and is expected to reach nearly every county by the close of the year. A vigorous fight is being made against the Bell Company in many parts of the State. The directors elected officers as follows: President, P. J. Grophs, West Union; vice president, Dr. S. H. Yost, Fairmount; treasurer, J. R. Alexander, Clarksburg.

Mr. Carroll's bill in the New Jersey Legislature compelling electric light companies to use red insulators where electric light wires are strung on the same poles with telephone or telegraph wires was reported adversely by the Revision of Laws Committee. When the bill was returned to the House a motion was made to have the House concur in this report, but an amendment to non-concur, offered by Mr. Carroll, prevailed and the bill went on the calendar for a second reading. The object of the bill is to prevent accidents to telegraph and telephone linemen who, while repairing wires, could tell at a glance which were the dangerous wires if red insulators were used.

Manager Huber of the Citizens' Telephone Company, Vicksburg, Miss., reports that his company is progressing most satisfactorily. A number of obstacles were encountered in Vicksburg, but they have all been overcome, and the company is now in such position that it can go on with its work without any interruption. The new subscribers are being put in at the rate of five a day, and it is expected that the capacity will be largely increased in the near future.

The Minneapolis city council has passed an ordinance granting to the Mississippi Valley Telephone Company permission to build a plant and operate a general telephone exchange in Minneapolis. According to the ordinance, the new company must use the metallic circuit through the entire city, and the limit for business telephones is \$48 a year and for residence telephones \$30 a year.

The Interstate Telephone Company is extending its lines in Kansas. Lines will be built connecting St. Joseph, Mo., with Wathena, Troy, Hiawatha, Pierce Junction and

Marysville. The system when completed in Kansas and Nebraska will embrace about 2,000 miles. As soon as the lines west of the Missouri river are in working order, the work of stringing wires to St. Louis will begin.

S. G. Higgins, president of the Saginaw Valley Telephone Company, has, it is understood, entered into an agreement with P. Cooper Burns, president of the American Electrical Company of Grand Rapids, Mich., to connect the Saginaw Valley and Grand Rapids independent telephone systems. The line will be built of copper, full metallic, by way of Howard City, Edmore and Alma, and work will begin at an early date.

In the Virginia Legislature when the Senate bill which imposes a transmitter tax of \$1.50 each on telephone companies who have more than 2,000 telephones was presented, Mr. Saunders offered as an amendment that the tax be made \$2.50 for each transmitter of companies having over 4,000 telephones. The amendment was agreed to and the bill was passed.

The Bell Telephone Company's instrument statement for the month ended February 20 shows: Gross output, 23,897; returned, 12,790; net output, 13,107. For the same month in 1897 the gross output was 19,680; returned, 8,015; net output, 11,665. A noteworthy feature of the February statement for 1898 is the large number of instruments returned, 12,790, which stands as a record.

At the meeting of the Merchants & Manufacturers' Board of Trade, held in New York last week, resolutions were passed condemning the high telephone rates in New York, and a committee was appointed, composed of leading members of the board, to visit Albany and endeavor to convince the Senate Finance Committee that they should recommend for passage the bill now in their hands providing for lower rates.

Superintendent John D. Easterling of the Southern Bell Telephone Company at Mobile, in recognition of the fidelity shown by the employees during the recent fever visitation, sent a substantial check to each of them, enclosed in a letter thanking them for their faithfulness and care of the company's interests during the epidemic.

The Telephone Subscribers' Association of Washington, D. C., which originated in the movement to obtain cheaper telephone rates, has been made a permanent organization. W. W. Danenhower is the treasurer.

The Snake River Valley Telephone Company has been granted a franchise at Idaho Falls, Idaho. The company has wires strung from Market Lake to St. Anthony and Menan now, and is extending its line to the Falls. It will also extend its line to Lost River points.

Upon the petition of J. E. Keelyn, Judge Simonton has signed an order for the foreclosure of the Carolina Mutual Telephone Company of Charleston, S. C., and appointed Major George H. Edwards receiver. A Charleston dispatch states that the company will be reorganized.

The city council of Owosso, Mich., has granted a franchise to the Owosso Telephone Company with the understanding that the company must have fifty telephones in operation by September 1.

The Citizens' Telephone Company of Newport News, Va., is pushing work on its line and will in a few days have connections with Hampton, Phoebus, Old Point and Norfolk.

The Michigan Telephone Company has canvassers out at Bay City soliciting new subscribers at the \$12 a year rate. All contracts are made for one year.

A new telephone line will shortly be introduced at Muscatine, Ia., by the Mississippi Valley Telephone Company.

New Companies Incorporated.

The Interstate Telephone Company of Sioux Falls, Sioux Falls, S. D. Capital stock, \$10,000,000. Incorporators: Charles O. Bailey, John H. Voorhees and J. W. Carter.

The Southwestern Telegraph & Telephone Company, Santa Fe, N. M.—to put in a telegraph and telephone line from Santa Fe via Cerillos and Thornton to Bland in the Cochiti district. Capital stock, \$10,000. Incorporators: W. N. Townsend, manager of the Postal Telegraph office at Santa Fe, J. P. Connor and H. A. D. Purdy.

The Enfield Telephone Company, Enfield, Me.—to carry on a telephone business. Capital stock, \$2,000. President, Samuel W. Bragg; treasurer, Michael S. Fahey; clerk, Herbert W. Lord.

The Western Telephone Company, Goodland, Marion County, Ind. Capital stock, \$30,000.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.
 a Consolidation of Baltimore Traction Co. and City & Suburban Ry. Co.
 b Company controls Citizens' Railway, North Baltimore Passenger Railway, Baltimore & Curtis Bay Street Railway, Baltimore & Pothan Railway, Pimlico & Pikesville Railway and Wallbrook, Gwynn Oak & Powhatan Railway and Park.
 c Owned by Brooklyn Rapid Transit Company.
 d Leased to Brooklyn Heights Railroad Co., which guarantees 10 % on capital stock.
 e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Heights Company.
 f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.
 g Owned by Atlantic Ave. RR. and leased to Nassau system.
 h 800 shares on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.; \$200,100 of stock owned by North Chicago Street Railroad Company.
 i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
 j 88 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$625,100 of stock owned by West Chicago Street Railroad Company.
 k Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,500,000 stock guaranteed by West Chicago Street Railroad Company, lessee.
 l Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. † Ex div.
 a Leased to New Orleans Traction Company at 6 % on stock.
 b Leased to New Orleans Traction Company at 8 % on stock.
 c Leased to Central Crostown Railroad at 8 % on stock and interest on bonds.
 d Operating the former Met. Trac. system, that corporation having become extinct.
 e Leased to 2nd Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
 f Leased to Houston, West Street & Pavyon Ferry—now Metropolitan Street Railway.
 g Leased to Metropolitan Street Railway at 8 % on stock until Oct. 1, 1897; thereafter 9 %.
 h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1896, at \$215,000 per annum.
 i Leased to Metropolitan Street Railway for 18 % on stock.
 j Leased to Met. St. Ry. for 99 years from April 20, 1892; 6 % first 5 years, 8 % thereafter.
 k Leased to Metropolitan Street Railway for \$145,000 per annum.
 l Leased to Metropolitan Street Railway for 18 per cent. on capital stock.
 m Controlled by Third Avenue Railroad by purchase.
 n Dividends of 1½ % yearly guaranteed by Consolidated Traction Company.
 o Controls by lease the Allegheny, Cent. Citizens, Duquesne, Fort Pitt and Pitt's Trac. Co.
 p Leased to Consolidated Traction Company for 8 % per annum on par value of stock.
 q Leased to Fort Pitt Traction Company for 8 % on \$8,000,000 capital stock.
 r Leased to Consolidated Traction Company for 4 % on capital stock after October.
 s Leased to Consolidated Traction Company for 7 % on capital stock after October.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½@11¾c.; Lake, 12c.; casting, 11½@11¾c.

The foreclosure sale of the Inclined Plane Railway at Cincinnati is advertised to take place April 14.

The gross receipts of the Hartford Street Railway Company of Hartford, Conn., within the city limits, for the year ending December 31, 1897, was \$406,525.83.

The Park City Railway of Bowling Green, Ky., was sold under foreclosure February 28 and purchased for \$23,350 by the Fidelity Safety Vault & Trust Company of Louisville, the mortgage trustee.

A fire in the "South" exchange of the New York & New Jersey Telephone Company, 559 Fifth avenue, Brooklyn, N. Y., on the night of the 4th inst., damaged the telephone property to the amount of \$5,000.

Matthew Bolles, who died at Boston on the night of the 1st inst., was the oldest member of the Boston Stock Exchange, and was until his death the last surviving charter member of the Exchange, which was founded in 1834.

The New York Senate Committee on Miscellaneous Corporations has agreed to report favorably Senator Lamy's bill requiring gas and electric lighting companies to pay interest on sums deposited with them by consumers.

The Chicago City Railway Company has mapped out changes, extensions and improvements of its system for the present year to cost \$2,900,000. The cable system will be abandoned for an underground electric system costing \$1,000,000.

The Boston & Albany Railroad Company as an experiment has lighted some of its cars with electricity, the system used being that of the American Railway Electric Light Company. The B. & A. Railroad is the first New England road to experiment with the new system.

Attorney-General Knowlton, at Boston, has rendered a decision against the Pipe Line Gas Company, which in effect declares that the \$1,000,000 stock issued by the company is illegal because it was not authorized by the Board of Gas and Electric Light Commissioners in accordance with the provisions of the statutes.

The New York "News Bureau" has increased its dimensions about one-third and made several typographical improvements in its columns. The ugly yellow paper on which it was printed has also been superseded by a handsome drab-colored paper very pleasing to the eye. The "Bureau" as a financial newspaper has made itself a necessity in Wall Street circles.

The Pittsfield Electric Company of Pittsfield, Mass., held a special meeting recently and voted to increase the capital stock from \$100,000 to \$125,000, and to increase the bonded indebtedness from \$75,000 to \$100,000, provided that leave can be obtained from the Board of Electric Light and Gas Commissioners to do so.

Application will be made in a few days to the Philadelphia Stock Exchange to list the Pennsylvania Manufacturing, Light & Power Company \$15,000,000 stock and \$15,000,000 bonds in the unlisted department. Application is also to be made shortly to list securities of the United Traction Company of Pittsburgh as follows: \$17,000,000 common stock, \$3,000,000 preferred and \$1,725,000 five per cent. bonds.

A mortgage for \$150,000 given by the Leavenworth & Lansing Railway Company to the United States Trust of Kansas City has been filed in the office of the Register of Deeds at Leavenworth, Kan. Gold bonds bearing 6 per cent. interest and falling due January 1, 1918, are to be sold to build and equip the road. A large portion of the roadbed has already been completed.

The report of the Nassau Electric Railroad, Brooklyn, N. Y., for the quarter ended December 31, 1897, filed with the Railroad Commission, shows: Gross earnings, \$430,702; operating expenses, \$260,675; net from operation, \$170,026. In 1896 the gross earnings were \$367,782; operating expenses, \$237,365; net, \$130,416. There was a deficit in 1896 of \$28,088 and a surplus in 1897 of \$4,471. The total surplus in 1897 was \$224,321.

The New York Court of Appeals has affirmed the judgment in the case of Anna C. Erickson, who obtained a verdict of \$23,000 against the Brooklyn Heights Railroad Company for the loss of her leg in a trolley accident. The judgment, with the accumulation of costs and interest, amounts to nearly \$30,000.

The Siemens & Halske Electric Company of America, Chicago, has sued for an accounting with the Wells & French Company and O. W. Meyenburg. Mr. Meyenburg was president of both companies, and it is claimed was more interested in the Wells & French Company than in the Siemens & Halske, and in the transactions between the two companies so favored the former company as to inflict an alleged loss of \$100,000 on the latter.

Roswell Miller, president of the Chicago, Milwaukee & St. Paul road, is reported to have stated that it had been decided to equip the Chicago & Evanston division of the road with an electric trolley system. This branch of the system is devoted exclusively to suburban service. It has never paid. The change in the motive power from steam to electricity is to be made with the view of reducing expenses and furnishing improved service.

The litigation in the United States Court between the Knoxville Street Railway Company and the Rapid Transit Company, together with all court costs, etc., was practically settled by a decree handed down a few days ago by Judge Clark in the case of the Union Trust Company against the Knoxville Street Railway Company. This final settlement of the litigation between these street railway companies is in anticipation of the consolidation deal, and is a step toward perfecting the title of the properties for the new purchasers.

The net income over and above all fixed charges and taxes of the Consolidated Railway Company of Baltimore for the first six months of consolidation, as given in the treasurer's report read at the recent annual meeting, was \$328,888.20, against \$287,718.37, the income of the separate companies for the same time in 1896. The stockholders passed a resolution commending the directors for their good business management of the company.

The running of trolley cars across the Brooklyn Bridge at a toll of five cents a car, it has been discovered, has reduced the revenues of the Bridge so materially that the structure will no longer be self-supporting, and a portion of the running expenses will have to be paid with funds raised by taxation. At the present rate of loss it is estimated that the Bridge receipts for the year will not be more than two-thirds of the sum received last year. Commissioner Shea has prepared a report which shows that the Bridge receipts on February 22, Washington's Birthday, were \$1,526 as against \$2,711 on the corresponding day of 1897. On February 20, 1897, the receipts were \$4,220, and on February 19, 1898, they were \$2,221. These figures indicate to some extent the falling off in the receipts. As the Bridge loses the trolley companies gain.

The directors of the Commercial Cable Co. have declared the regular quarterly dividend of 12 per cent., payable April 1. Books close March 21 and reopen April 2. The report of the company for the year ending December 31 last shows net revenue, after deducting all expenses and \$11,750 for depreciation, of \$1,200,155, an increase of \$78,502 as compared with the previous year. The net revenue of the Postal Telegraph & Cable Company, which was purchased by the Commercial Cable Company on January 1, 1897, after deducting all expenses and setting aside \$60,000 for depreciation, was \$645,185, making a total for the system of \$1,845,341, out of which there has been paid interest on the first mortgage bonds and debenture stocks, dividends of 7 per cent. and a bonus of 1 per cent. on the capital stock, a total of \$1,440,000, leaving a balance of \$405,341, and making the total amount to the credit of surplus revenue, \$1,002,019.

ELECTRICITY.

EDITORIAL NOTES.

The New England Gas & Coke Company.

In an editorial in our issue of December 29, 1897, we commented at some length on the methods of the New England Gas & Coke Company as set forth by Mr. Lawson of the well-known firm of stockbrokers, Messrs. Lawson, Weidenfeld & Co., of New York and Boston.

Mr. Lawson's exposé regarding the above gas company, which appeared in several daily papers, led us to believe that the scheme attacked was another of those nefarious projects which are carried through, to the sole advantage of the arch conspirators, by means of glowing promises that could never be fulfilled.

As stated in our former editorial, the New England Gas & Coke Company got control in some way of the Boston, South Boston, Roxbury and Bay State of Massachusetts gas companies, doing over two-thirds of Boston's gas business. The Bay State Gas Company of Delaware, that controlled the Boston Gas Company, purchased the Brookline Gas Company from the Standard Oil party to end a competition that was seriously affecting their interests. The Bay State Gas Company of Delaware then caused a contract to be made whereby the Boston Gas Company agreed to purchase each year a certain amount of gas from the Brookline Gas Company to enable the latter to pay all its expenses and 10 per cent. dividend on its capital stock.

In the thirteenth annual report of the Massachusetts Gas and Electric Light Commissioners, which has recently been issued, the following statement appears:

"The board's attention has been called to a contract between the Boston Gaslight Co. and the Brookline Gaslight Co., which provides that for a term of 25 years from May 2, 1896, the Boston Co. shall buy of the Brookline Co., annually, such an amount of gas as will, together with the sales of the Brookline Co. to other customers, enable that company to pay all expenses, including expense of manufacture, depreciation, etc., interest at 5 per cent. upon Brookline bonds, 6 per cent. interest on promissory notes and other obligations then issued, 4 per cent. upon future notes or obligations and a dividend of 10 per cent. per annum upon Brookline capital stock. Price to be paid for gas \$1 per 1,000. At the time the contract was made there was no reason to doubt the ability of the Boston Co. to either manufacture all the gas needed or purchase a sufficient amount from the Bay State Gas Co. at a lower price than that named in the contract.

"The Boston Co. has purchased no gas under this contract, but upon tender by the Brookline Co. has paid at sundry times during the year ending May 1,

1897, about \$67,000. The Brookline Co. has thereby been enabled to pay from the treasury of the Boston Co., but not from its own earnings, interest on all its outstanding liabilities and 10 per cent. upon its stock. The contract in question was made at a time when the Brookline Co. had been unable to secure from its own business a fair return upon the necessary investment. The contract must be regarded as one of questionable public policy and of such a character as under most conditions might be absolutely unlawful or fraudulent, and should be abrogated."

The Bay State Gas Company of Delaware was ultimately forced into the hands of a receiver, and was obliged to turn over the management of the five local gas companies in Boston to the Standard Oil party. The understanding was that the Bay State Gas Company of Delaware had the right to take back the management of these several companies at any time it could see its way to settling. \$9,000,000 of Boston United Gas bonds, first series. The Bay State Company was on the verge of resuming the management of the various gas companies when the New England Gas & Coke Company stepped in and proceeded to negotiate with the Standard Oil party for the purchase of its Brookline and Dorchester gas companies.

In the report just issued the Commissioners review the incorporation of the Massachusetts Pipe Line Company, which represents, according to Mr. Lawson, practically nothing but a charter, its contracts with various Boston gas companies for their supply of gas, and its contract to purchase gas from the New England Gas & Coke Company. The Commissioners say:

"The knowledge of these transactions has so recently come to the board that it is difficult at this time to fully appreciate their importance. One purpose, however, would seem to be to offer to the public upwards of \$27,000,000 of new securities free from the restrictions and supervision imposed upon regularly incorporated companies engaged in a kindred business, and free particularly from the provisions of chapter 450 of the Acts of 1894, which prohibits gas companies from issuing stock or bonds except as approved by the Gas Commissioners. Attention is particularly called to these facts as constituting a notable evasion of existing laws passed for the mutual protection of the investor and consumer, with the suggestion that if any check is to be imposed upon such a course, some additional legislation will be necessary."

As could readily have been foreseen, the Commissioners recommend the abrogation of the Boston Gas Light Company's contract with the Brookline Company, and condemn the action of the Massachusetts Pipe Line Company. In this same report the Commissioners give some details relating to the operation of municipal gas and electric lighting plants which

should prove interesting to those who advocate municipal ownership. "The aggregate returns of 14 municipal gas and electric light plants show for the electric light plants as follows: Total receipts, \$52,106; expenses, \$122,261; net loss in operating, \$70,155; interest on notes and bonds, \$25,955; depreciation, \$39,777; loss on jobbing, \$273; total cost of street lighting, \$136,160. The operation of gas plants shows a net loss of \$9,839."

* * *

Street Railways and Municipalities.

A Special Commission appointed by Governor Wolcott of Massachusetts some time ago, to investigate the relations between municipalities and street railway companies, recently handed in its report, which has created considerable interest. The Commission's recommendations were made after one of its members had visited a number of European cities, and other of its members had examined carefully into the relation existing between municipalities and many of the most important street railways in this country. Like the majority of State Commission reports issued in Massachusetts, this one is exceedingly thorough and complete, the conclusions of the Commission having since been embodied in two bills for presentation to the State Legislature. The principal propositions of the Special Street Railway Commission's report are as follows:

"1. That the corporation tax now collected by the State on the excess of the share value of a company above the value of the real property be distributed to the cities and towns containing the trackage of said company in proportion to the mileage in each, instead of as now, to the localities where the stock of the company is owned or held.

"2. That where dividend payments go above 8 per cent. the street-railway companies be required to pay into the State treasury a sum equal to the excess except where a company has failed to earn an average of 6 per cent. a year from the time of its incorporation.

"3. That a franchise tax additional to that now imposed in the manner noted in the first paragraph above be levied on the gross earnings of the companies, the rate varying from 2 per cent. where gross receipts per mile of track operated shall amount to \$7,000 or less a year to 3 per cent. where such receipts amount to \$28,000 a mile or more.

"4. That cities and towns be permitted to buy in existing street railway track at the cost to replace it, and to construct new track or extensions as the public convenience may dictate, the local government thereafter to maintain the way as it maintains other parts of the streets, and to be compensated therefor by the railway company using the tracks in a sum fixed by mutual agreement or by a referee for periods of seven years."

These recommendations would seem to be excellent, if we except possibly the last. Whether any material benefit would be derived by a city's owning the street railway tracks is questionable. If these tracks are to be leased to a company for the short period of seven years, with the possibility that at the expiration of that time the lease will not be renewed except at a much higher rate, a railway company might justly show considerable hesitancy in investing a large sum of money in a power station and other suitable apparatus. Regarding this matter the Commissioners appear to have adopted a middle course and shown themselves rather conservative.

Probably the most important paragraph of the whole report is the one that refers to the number of passengers that a road would be obliged to carry in a year per mile in order to secure a return of 6 per cent. on the capital invested. This passage, which we referred to in a recent issue of *ELECTRICITY*, reads as follows:

"An intending investor in an existing or projected street railway enterprise will take into account the chances in a series of years of a management and success a little below as well as above the

general average. If he desires a regular annual return of 6 per cent. on his shares, he ought to be convinced, we think, that the railway will carry year in and year out more than 135,616 passengers per mile operated, and more than 4,014 per \$1,000 of capital investment; otherwise, the probabilities, based on the experience of 48 companies, are that he must be content with a smaller return. Unless it can be demonstrated, moreover, that the railway will carry year in and year out more than 70,895 passengers per mile operated, and more than 2,532 passengers per \$1,000 of capital investment, the chances, as proved by the experience of 28 companies, are that he will receive no dividend at all."

From some data on this subject which we happen to have on hand, we find that the Special Commission's estimate of 135,616 passengers that would have to be carried yearly per mile to earn 6 per cent. is correct, or at least agrees with our figures, provided the operating expenses of a road do not exceed 7 to 7½ cents per car mile, which however is extremely low and hardly a fair average. In localities where fuel is, say from \$3 to \$4 a ton, the operating expenses would be considerably higher, ranging in the neighborhood of from 8 to 13 cents per car mile. Taking 11 cents as a good average, according to our figures 206,000 passengers would have to be carried per mile per year to enable an electric road to earn a dividend of 6 per cent. An electric car must earn about 18 cents gross per mile to pay 6 per cent. on this investment, allowing nothing for the cost of the franchise.

Taking it all in all the report of the Massachusetts Special Railway Commission is an exceedingly able one, and the suggestions contained therein should prove valuable.

* * *

Electric Fish Torpedoes.

What is known as fish torpedoes have played an important part in modern naval contests, especially during the late struggle between Japan and China. These engines of warfare are propelled through the water by means of either compressed air or electricity. Fish, or automobile, torpedoes were especially designed for harbor protection and have now reached a high state of perfection. They can be controlled either from the shore or from a ship at anchor.

A fish torpedo when in use is entirely submerged with the exception of a float that skims the surface of the water. At either end of the float a small flag is usually located by day and an electric light by night. The lights at night are hidden from the enemy by means of a shade which permits of the lights being seen only from behind. By noting the position of the flags or lights the torpedo may be guided from the shore in any desired direction. In the after part of an electric fish torpedo is located a reel carrying three separate coils of insulated wire, one of which is attached to the motor located in the forward part of the cigar-shaped boat, a second controls the steering apparatus, while the third enables the operator on shore to fire the explosive.

Lieut. Nicholas J. Halpine, U. S. Navy, has recently invented a new form of electric fish torpedo which bears his name. In reality the Halpine torpedo is an electric launch which carries within itself sufficient power to propel it a distance of fifteen miles. The body of this craft is twenty-six feet long by twenty-four inches in diameter. It is operated from the shore by means of two cables, each of which has seven strands of wire. One cable is attached to the motor and supplies the latter with the requisite amount of current, while the second is connected with the rudder. Electrical connection being made through a switchboard, the amount of current can be varied or reversed, thus enabling the operator to propel the torpedo either ahead or astern.

The principal advantage claimed for this new form of electrical fish torpedo is that no obstacle can prevent its reaching a vessel against which it is sent.

When the harpoon-tipped point with which this

form of torpedo is provided strikes an obstacle such as a torpedo net, it is supposed to penetrate one of the meshes, the force of the blow releasing this tip and opening two flanges, which would prevent the tip being drawn out of the net. From the flanges a chain runs back to a compartment containing the torpedo. This same impact against a collar is supposed to release a car which slides forward, and at the same time a spring tears off the leaden covering on the end of the water-tight tube which runs through the can and is surrounded by the explosive. As the cover of the tube is torn off, water naturally enters and comes in contact with metallic potassium, which ignites, the flame setting off a rocket which shoots forward carrying the car containing the explosive. As the torpedo tube has a downward inclination, the torpedo is supposed to shoot downward, passing under the net, and on reaching the end of its chain move upward until it strikes the vessel.

Experience has shown that torpedoes are at times extremely unreliable, and are very apt to explode when least desired. It would therefore seem questionable whether the Halpine torpedo could be made to work satisfactorily, owing to the large amount of delicate mechanism within it.

Under the Searchlight.

Notes and Comments on Various Topics.

In the weekly financial review published by the well-known banking house of Henry Clews & Co., the following statement appears: "The most marketable properties in the world at the present time are new warships. While there is so much competition for them it is a good time for stock operators to be conservative." As Mr. Coffin and Mr. Westinghouse will therefore, owing to the unsettled condition of the market, find their present stock-jobbing industries rather dull, they might turn their attention to the class of "securities" indicated above. They would not find it difficult to form a trust in warships just now, and doing this would afford them some relief from the vexations of the situation.

* * *

OUR contemporary the *Electrical Engineer* is to be congratulated on adding another correspondence school to the number already in existence. We presume as this Institute is named after the paper it will be run as a supplement to the latter, or possibly the *Electrical Engineer* will be run as a supplement to the Institute seeing the latter is capitalized at \$50,000.

* * *

THE Lamp Pool held its monthly meeting on Friday last at the Hoffman House, New York. As there was little business to be transacted, the meeting was adjourned the same day. It behooves the Pool to keep careful record of their meetings, as some day, under the anti-trust law, they may be called to account for all of their "dark-lantern" conferences.

* * *

THE Hayden Electric & Mining Company was recently incorporated to furnish light and power for the town of Cripple Creek, Col., and the mines in the district. Capital stock, \$50,000. Incorporators: M. A. Ledy, C. S. Tschudi and Edward P. Creighton, all officers of the Cripple Creek Electric Light Company. There was some sharp practice in an endeavor to secure incorporation by this company. Another company had been organized under the above name, had obtained a franchise from the board of aldermen to furnish light and power in Cripple Creek, and was likely to be a dangerous competitor of the established company. The officers of the latter, the Cripple Creek Electric Light Company, determined to prevent this, and having learned, as they supposed, that the real Hayden Company had not filed their incorporation papers, called a hasty meeting, resolved to adopt the name of the rival

company, fixed upon the capital stock, had incorporation papers drawn up, took a special train to Denver, and finding no other company of that name on the records in the Secretary of State's office, went through the necessary formalities and filed their certificate of incorporation as the Hayden Electric & Mining Company. Subsequently it was discovered, however, that a mistake had been made. The real Hayden Company had filed its articles after all. The papers were filed on the afternoon of March 1 and had not been entered in the book. They were still in the pile of unentered companies awaiting their turn with the entry clerk.

* * *

MGR. ALEX. DOW of the Edison Electric Company was brought before the Recorder's Court in Detroit a few days ago on the charge of obstructing an officer of the Lighting Commission, and was fined \$5 and costs amounting to \$25. When sentence was pronounced Mr. Dow addressed the court as follows: "Your Honor, I am entirely satisfied that I violated a law, but I desired to regulate the modes of entering the establishment, and I did not mean to interrupt the officer in discharging his duties. I was ungentelemanly, probably, and it would have been a better course just to enter a protest than to throw the officer out, but we were mad. What I contend is that I have a perfect right to say what doors shall be used as a means of entrance and exit in our establishment, and that is what I wanted understood when I came in here."

* * *

MR. J. D. OLIGNY, contractor, of Montreal, is an unhappy inventor. He had spent much time on the invention and construction of an incinerator, and a public test was to have taken place this week, but previously a fire started in an old slaughter-house, at Cote St. Paul, where the incinerator was housed, and now nothing is left of it but a wreck. Mr. Oligny represented that he could destroy garbage by means of electricity and a certain solution which hastened decomposition. It did not matter whether the garbage was ashes, metal or stone, all would be destroyed, but the inventor did not make his incinerator fire-proof, and the fire fiend found it out. Mr. Oligny expects to repair the machine for a proper test.

* * *

ACCORDING to the New York *Morning Telegraph* the Westinghouse Company is circulating the following little story at the expense of its rival, the General Electric Company:

Be it understood in the first place that the General Electric Company is Charles Proteus Steinmetz, and C. P. S. is the General Electric Company. One could not go on without the other. To be more explicit, Steinmetz is the man to whom General Electric goes when it has a vast electrical problem to be worked out. General Electric fills Steinmetz up to the throat with figures, and says to him, "Make of them an electric machine that will be a marvel to the world and cause our rivals to turn green with envy." Steinmetz looks at the General Electric's representative with the calmly calculating gaze of a man who knows he has no equal when high voltage experimentation is in question, and says: "You comes to me at 'dis time next morning, and I for you haf der answer."

Then Steinmetz goes to work in his own peculiar manner. With a box of cigars and an urn of strong coffee he shuts himself up in his den at the General Electric establishment and gives himself up to thought. Those who have caught glimpses of him while he has been working out his problems say that he sits and smokes and sips coffee and gazes up at the moon through the window, as though the cigars and the coffee and the moon were his familiar demons. Steinmetz is supposed to go through awful travail of soul during these times, but the ideas that are born of his suffering have made his name famous all over America.

Recently some ill advised individual connected with the General Electric Company caused a notice to be posted around the place, forbidding any one to smoke. The intention was to reduce the rate of insurance and so effect a considerable saving to the company. The morning after the notice appeared, an apparition presented itself before the astonished eyes of the chief. It was dressed in traveling costume, shawled and gloved as though for a trip to the great Northwest. Divested of the shawl that enveloped

the upper part of his figure, Steinmetz stood disclosed. The chief gasped, and wondered what had happened to the great mathematician. The apparition extended towards him a gloved hand.

"I haf come to tell you good by," it said. "General Electric hafs no usage for mein surfaces longer. I go back to Chermanny."

"What on earth is the matter, Stein?" gasped the chief. "You haf stopped mein schmoking," answered Steinmetz. "No schmoke, no inventions. If my cigars you say go, then I go, too."

Of course, Steinmetz could not be allowed to go for such a small thing as a smoke, so the matter was patched up by Steinmetz being provided with a den in the foundry, the only part of the building where there is a fire, and here he now sits and wrestles with X, Y, Z, with his eyes fixed on the fire of the furnace instead of on the moon, and the other two demons in close attendance.

"A 'ROAST' FOR A ROASTER."

A circular sent out by a Trust company says:

"Try our anchored filament 220-volt lamp. The best one yet offered."

"This cut represents the standard 16 c. p. special called filament incandescent lamp."

[Here a cut of a lamp is shown.]

"Its proven superiority is the result of careful attention to the details in its manufacture, and the use of our special filament, which excels all others in maintaining normal candle power for a given length of time."

"While all filaments will decline in candle power, as used, the relative amount of the decline, other things being equal, determines the value of a lamp."

"A lamp, the first cost of which may be seventeen (17) cents, showing a loss of 25 per cent. in candle power at the expiration of 600 hours' burning, is an expensive luxury for the central station. A loss is incurred which should be anticipated, as the cut in price invariably means a cut in quality."

"When you buy oil, you insist on receiving four quarts to the gallon, not three; in the matter of coal you refuse to accept fifteen hundred pounds for a ton. Why buy and pay for sixteen candle power lamps that actually show but twelve candles in six hundred hours' service? Why pay seventeen cents for a lamp worth but thirteen—a lamp that is of low efficiency at the start and abnormally so before it has burned three hundred hours?"

"This company pledges itself to the actual delivery of the candle power it offers for sale. Whether the lamp purchased by you be of forty-five, fifty or fifty-five watts, you can depend on the candle power being full sixteen if the lamp be so marked."

"Furnish us information as to the condition of your plant and we will send you lamps that will meet the requirements. Lamps that will please you and your patrons. Lamps uniform in voltage and candle power, that produce a brilliant and maintained illumination."

The Warren Electric & Specialty Company, against whom this circular was evidently aimed, have published a very handsome circular in which they comment upon the above in a characteristic manner as follows:

"We don't need any better advertisement than to have one of the Trust companies advertise that our lamps have lost some candle power after 600 hours' burning. If their elastic consciences will not permit them to make a more damaging statement than this, the consumer can put two and two together and order the best lamps from us at the best prices."

"It now looks as if they intended to force themselves into good society by joining their name to the tail end of ours. They would not have been content a year or two ago to be tailenders. This is the name—Anti-trusticussibust. We have advertised ourselves as 'anti-trust.' This is the best part of the word. We account for the balance of the name in this way: According to the most authentic reports the Trust have spent a great deal of time in 'cussing' us, so it seems reasonable that 'cuss' having been uppermost in their minds, 'cussi' should seem pat to them (we don't understand the French of it, but no matter), and as one of the Trust companies 'busted' a few days ago the last syllable is accounted for."

"We pierced their armor. We thought we would find the weak spot after a while. We have tried to find out a number of times what candle-power their lamps would be after 600 hours' burning, but so far have utterly failed, for the reason that they did not burn that long. We do not know why we would not feel grateful to the lamp consumers. Wouldn't doubling your business make you feel so? We thank you for past favors, and solicit your further orders for our lamps at 17 cents in barrel lots for lamps capped with Edison or Westinghouse bases; one cent extra for lamps capped with T.H., United States, Brush-Swan or Hawkeye bases. All other bases 8 cents extra. Respectfully yours,"

"THE WARREN ELECTRIC & SPECIALTY COMPANY,
Warren, Ohio,"

"Manufacturers High Grade, Anti-Trust Incandescent Lamps."

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES OF EUROPE.

BY JOHN B. C. KERSHAW, F. I. C. (LONDON).

Chapter XVI.—Organic Chemicals and Dyes.

The application of electricity to the production of organic chemicals and dyes differs from all the applications that have hitherto been considered in these chapters, in the fact that the electric current is only used as an aid, and not as the sole agency, in carrying out the manufacture. These organic products are in nearly every case wonderfully complex combinations of atoms and groups of atoms. One of the modern synthetically built up dyes stands as far above such a compound as, say, sulphuric or hydrochloric acid, as a millionaire's palace stands above a mechanic's three-roomed tenement. The molecule of hydrochloric acid contains two atoms. The molecule of phenol-phthalein, one of the simpler organic dyes, contains 38 atoms, and the modern chemist is accustomed to building up step by step, in his laboratory, organic products containing a much greater number of atoms than this. The complex structure of these molecules containing such large numbers of atoms, each with a definite and fixed position relative to the others, of course necessitates a large number of successive steps in their manufacture. The organic chemist starting with benzene or naphthalene as his raw material, only obtains the dye or pharmaceutical product that he desires at the end of a long series of chemical changes and additions; and the popular idea that the most beautiful dyes lie hidden in coal tar is like many another popular idea—wholly at variance with the facts.

The production of such highly complex structures as those which we are considering, by a single series of primary or secondary reactions in an electrolytic cell, is of course out of the question, and it is thus only as an aid that electrolysis is used in the manufacture of organic chemicals and dyes. As an aid it is being extensively used, and it has been stated that nearly every German color works is now provided with an electric installation and the necessary accessories for electrolytic work.* The actual facts as to the different organic compounds in the manufacture of which electrolytic methods are used are difficult to obtain, but it has been stated that the firm of "vorm. E. Schering" of Berlin produce iodoform, the "Badische Anilin u. Soda Fabrik" at Ludwigshafen, yellow and congo reds, and Messrs. Bayer u. Cie. of Elberfeld, aniline dyes, by processes in which electrolysis plays a part.

I.—PROCESSES DEPENDING UPON OXIDATION OR REDUCTION.

In the production of organic chemicals and dyes, especially of those in which nitro-benzene is a starting point of the manufacture, oxidation and reduction play a most important part. It may be explained that an oxidation signifies a chemical substitution of oxygen for hydrogen or some other equivalent element in the molecule, while a reduction signifies the substitution of hydrogen for oxygen. It is here that electrolytic methods are serviceable, and at the present time in many German color works electrolytic oxidation or reduction has taken the place of the chemical methods earlier used for obtaining these results. If a dilute solution of sulphuric acid or any other mineral acid be electrolyzed between platinum electrodes, the acid splits up into positive and negative ions. If sulphuric acid be used, the change may be represented as below:

The SO_4 immediately reacts upon the surrounding water according to the following equation:

Oxygen gas is thus liberated at the anode, hydrogen

* "Die Entwicklung der Elektrochemischen Industrie," Zeitel. P. 119.

gas at the cathode, as the result of the electrolysis. These liberated gases at the moment of their passage from the ionic into the molecular state are in the condition known to chemists as "nascent," and thus it is possible to obtain oxidation effects at the anode, and reduction effects at the cathode, upon the other chemicals that may be present in the cell. In some cases, however, contact with an acid solution would lead to decomposition of the compound to be acted upon, or of the product desired. In such cases a dilute solution of caustic soda may be used. The electrolytic changes in this case are as follows :

These ions then enter into secondary reactions as follows :

The final results are thus nascent oxygen at the anode and nascent hydrogen at the cathode as before. The Farben Fabrik vorm. Fried. Baeyer u. Cie. of Elberfeld is the works in which the greatest use has been made of the electrolytic methods of reduction, and many of the processes which have been worked out and patented by Güttermann are now used industrially in this establishment. The facts that organic chemicals are poor conductors of electricity, and that the conductivity diminishes with increasing weight and complexity of the molecule, are much in favor of these new methods of procedure. If it were otherwise and if the conductivity of these complex organic compounds were equal to that of the mineral acids, the methods would be impracticable, for electrolysis would mean simultaneous decomposition of the organic chemical by the current. A few examples of these methods may be given as typical of the whole number.

Production of Aniline from Nitro-Benzene.—This is the second step in the manufacture of aniline dyes, the nitrification of benzene being the first.

The reduction of the NO_2 group in the benzene ring, to the corresponding NH_2 group that takes its place in aniline, is usually effected by means of hydrochloric acid and iron. Dr. Elbs has however shown* that if nitro-benzene be electrolyzed in the cathode compartment of a cell containing a dilute sulphuric acid solution in the anode chamber, by means of a zinc cathode, and a current density of from 90 to 136 amperes per square foot, a similar reducing action will be obtained, and aniline will be produced.

Production of Amido-Phenol from Nitro-Benzene.—If nitro-benzene be dissolved in five to ten times its weight of concentrated sulphuric acid, and be electrolyzed between platinum electrodes in the cathode compartment of a cell containing sulphuric acid in the anode chamber, with a current of $1\frac{1}{2}$ to 3 amperes and an EMF. of 5 or 6 volts, the sulphonic acid derivative of amido-phenol will be produced.† From this the amido-phenol itself can be prepared by the usual methods.

Production of Aniline-Black from Aniline.—This change is an example of oxidation, aniline-black being an oxidized product of aniline. The aniline is electrolyzed in the anode chamber of a strongly acid cell, with an anode of lead. Sulphuric acid should be used. The conditions require careful attention, as slight variations in the acidity of the electrolyte, temperature of the cell, current density, or material of the electrodes, lead to the production of different shades of green or greenish black.

Production of Various Dyes from Aniline Sulphate.—Rosaniline, chrysaniline and leucaniline may all be obtained by electrolyzing concentrated solutions of aniline sulphate, under varying current conditions, in the anode chamber of a sulphuric acid cell.

Further details of these may be obtained from the paper mentioned below.‡

II.—PROCESSES DEPENDING UPON THE INTRODUCTION OF THE HALOGENS.

Turning now to processes in which the electric current is permitted to effect chemical changes other than those resulting from oxidation or reduction, the processes in which the elements chlorine, bromine or iodine (the halogen group) are introduced into the molecule by its instrumentality are the most important. The following three examples of this use of the current are typical of a very large number of others that cannot be treated of in detail:

Production of Iodoform from Alcohol.—Iodoform is an organic compound, similar in constitution to chloroform, but containing iodine in place of chlorine, and on this account being a solid at the normal temperature. It is much used in surgery. Its chemical formula is CHI_3 . The electrolytic method of manufacture depends upon the electrolysis of a solution of potassium iodide, in presence of alcohol and free alkali. The iodine liberated at the anode by electrolysis of the potassium iodide attacks the alcohol and replaces portion of the hydrogen contained in the alcohol molecule. This process was patented in Germany in 1884, and it is stated that the chemical firm "vorm. E. Schering und Cie." of Berlin are using it for the production of this chemical.* Doctors Elbs and Herz have investigated the conditions under which the best yield of iodoform is obtained. They find that a solution containing 50 grms. soda, 100 grms. potassium iodide, and 200 ccms. alcohol, in 1 liter water, a temperature of 60°C ., and a current density not exceeding 9 amperes per square foot, yields the best results.† The iodoform separates out as a solid in the anode chamber and should be removed hourly. Working without a diaphragm, a 60 per cent. efficiency can be obtained.

Chloroform and bromoform can be produced by similar methods, but the yield in the case of these chemicals, which are fluid at the ordinary temperature, is bad.

Production of Chloral from Alcohol.—Chloral is not only important as a narcotic and anæsthetic, but it is a chemical from which chloroform can easily be produced by the action of caustic potash. Its chemical formula is CCl_3COH . In order to obtain chloral electrolytically, a concentrated solution of potassium chloride is electrolyzed in a vessel divided into anode and cathode compartments by a diaphragm. The cathode is of copper, the anode of carbon; the latter is movable and is used for stirring the mixture in the anode chamber of the cell. The electrolysis is conducted at a temperature of 100°C ., and during its progress alcohol is allowed to flow into the anode compartment of the cell in a continuous stream. The chlorine liberated at the anode immediately attacks the alcohol, forming chloral and hydrochloric acid according to the following equation :

The potassium liberated at the cathode reacts with the water in the usual manner to form caustic potash and hydrogen. The caustic alkali is used to neutralize the acid formed in the anode chamber, potassium chloride being thus regenerated.

The theoretical yield of chloral would be 217 grams per EHP. hour, as 8 atoms (282 grams) chlorine yield one molecule of chloral (= 147 grams). The actual yield is stated to be 50 grams per EHP. hour, or 23 per cent. of that shown to be possible by theory. In these organic reactions, however, the expenditure of energy is altogether of secondary importance, the electrolytic methods being used on account of their greater convenience and neatness. This method for the production of chloral is stated to be in use at the chemical works of vorm. Schering u. Cie. in Berlin.‡ It is also stated that glucose, starch and sugar may be substituted for alcohol in carrying out the method.||

III.—MISCELLANEOUS USES OF THE CURRENT.

The purposes for which the electric current is used in the preparation of organic chemicals and dyes are not confined to the two broad classes of reactions that have been noticed in Parts I and II of this Chapter. Many other reactions than those of which typical examples have been given can be carried out through its agency. Limits of space forbid mention of more than two of these miscellaneous uses of the current.

Production of Cyanides and Ferrocyanides.—A very large number of patents have been taken out in recent years having for their object the direct production of cyanides from the nitrogen of the air. Readman in British patent No. 6,621 of 1894 proposes to obtain cyanides (and ferrocyanides) by fusing a mixture of oxides or carbonates of the alkalis and alkaline earths with carbonaceous materials (and iron) in an electric crucible or furnace. Nitrogen or generator gas is then allowed to pass over the fused mass, and direct union of the nitrogen with the other elements is said to occur. The writer is informed by the patentee that the patent rights of this process have been bought by a large company, and that manufacturing operations upon a large scale will shortly be commenced.

Production of Prussian-Blue and Other Cyanogen Compounds.—Goebel has patented a procedure* for the manufacture of prussian-blue by an electrolytic method. Solutions of potassium ferrocyanide and ferrous sulphate are prepared, and the turbid solution produced by their mixture is electrolyzed in the anode chamber of a sulphuric acid cell. Several shades of green and blue, representing differing stages in the oxidation of the ferrous cyanide to ferric cyanide, can be obtained by staying the electrolysis when the required tone is reached.

Conclusion.—In closing this review of the application of electricity to the manufacture of organic chemicals and dyes, the writer must emphasize the fact already noted that it is as an aid to the ordinary methods of procedure that electricity will be used in this wide field, and that in the majority of instances the greater number of changes involved in the production of any organic chemical will still be obtained by ordinary chemical methods of work. That, as an aid, electricity will be used on a continually widening scale in the field of organic chemistry is proved, not only by the statements of Oettel upon this subject,† but also by the increasing number of processes and reactions, published in the scientific papers and journals dealing with organic chemistry, in which electrolytic action plays a prominent part.

Electric Projects in France.

Consul Jackson, at Cognac, France, has reported to the State Department at Washington that the city of Niort proposes to have an electric railway and lights for its streets. Manufacturers interested in this subject can obtain any information by addressing Monsieur le Maire de la Ville de Niort, Deux-Sevres, France.

The Consul says there is also a movement on foot to connect La Rochelle with the new port, La Pallice, by an electric line $2\frac{1}{2}$ miles long. Communications in regard to the matter should be addressed to Monsieur P. W. Morch, Chamber de Commerce, La Rochelle, France.

The Dawson City Electric Company is applying to the Dominion Parliament for an act of incorporation. The company ask to supply electric light, heat or power throughout the city, and within a radius of 200 miles, as well as to operate an electric tramway.

DEATH BY ELECTRICITY.*

BY W. S. HEDLEY, M.D.

It is not always so easy as might be supposed to kill an animal by electricity. The experiments of Brown-Sequard and D'Arsonval long ago (1884) showed this, and many physiologists have since confirmed it. Kratter found that one short application of an alternating current at 1,500 volts sometimes did not kill either rabbits or guinea-pigs. Yet much lower voltages have often proved fatal to man. Indeed it seems not improbable, as the writer has stated on previous occasions, that all commercial forms of electric lighting currents, varying as they do from 80 volts upwards, may be dangerous to human life under certain conditions. It is, of course, true to say that, other things being equal, risk increases in direct proportion to the electromotive force; but absolute equality of "other conditions" can never be secured. The duration of the application, the nature of the contact, its superficial area and position, the condition of the skin, the periodicity of the current, the species of animal, its weight, age and perhaps even its state of health, are all factors in the result. That duration of contact has a most important bearing on the question is nothing more than might be expected, for reasons both physical and physiological, and all experiment proves it. It has been shown† that currents, easily borne by an animal when momentarily applied were fatal when the application was prolonged to 5–10 seconds. On the other hand, short but repeated applications of strong currents were almost invariably fatal. When other conditions are the same, the larger the area of contact, the greater the intensity of the current but the less its density, and the latter can never be left out of consideration in dealing with physiological effects. The condition of the skin, with reference to moisture, or any breach in its continuity is also a point of the first importance, inasmuch as the epidermis is the great insulator of the body. But, at the same time, it is to be remembered that the degree of skin injury is not always proportional to the gravity of the accident. Frequency of alternation must also be considered. It may be that fatal effects are in inverse ratio to the periodicity, although not perhaps according to a strictly "straight line law." Animals present differences in their resistances to the effects of electric currents according to their species, and even according to their individual peculiarities. Every animal seems in this respect to be a law unto itself. It was found in the experiments already alluded to that rabbits often survived currents which proved fatal to dogs ten times bigger. In the original electrocution experiments in America, experiments were made upon a horse, three calves and a number of dogs. The mean fatal current thus obtained was brought to bear upon the man to be executed, and the result proved a painful *fiasco*. Yet many experiences since then, some of them within recent months, have proved that a low as well as a high electromotive force may kill a man.

It is very generally admitted that in the case of animals killed by strong currents there is a tolerable uniformity in the post-mortem appearances: (1) The latter in many respects resemble those seen after death by asphyxia (*apnoea*); that is to say, the left side of the heart is comparatively empty, whilst its right side and the larger veins near it are distended and filled with dark fluid blood. The absence of hemoglobin from the blood is also a fact common to death by electricity and to death by *apnoea*. (2) The nervous system does not seem to present any very characteristic appearances—at least there is no gross "lesion" which can be said to be constantly present; but slight hemorrhages in the walls of the fourth ventricle and in the meningeal coverings are not rare. Yet there may be many finer molecular changes in the nervous tissues of which present

methods of investigation are not able to make us cognizant. (3) The points of penetration of the current are always evidenced by burns of various degrees. Less constantly the place of exit is similarly marked. These burns of entrance have considerable diagnostic value in cases when the cause of death may be in doubt. They may vary in severity from simple redness to complete destruction of the whole thickness of the skin; but, as already said, their severity has no close relationship with the gravity of the accident.

When a strong current is brought to bear upon a living animal, there is immediately a strong tetanic contraction of the entire striated muscular system; and on the circuit being broken there is often a deep inspiration, perhaps followed by an "expiratory cry." It is often this cry which first calls attention to the accident. In cases which are not fatal there is often loss of consciousness, which may be regarded as the clinical manifestation of the severe shock, or rather shaking, to which the whole central nervous system has been subjected. This is very different from what is surgically known as "shock." In the latter, the longer the condition of shock lasts the greater the danger. In electric accidents, danger of death diminishes, the longer the duration of loss of consciousness. It may be said that, if not immediately killed, the person usually recovers. This loss of consciousness soon disappears, perhaps even in a few minutes, but for days or weeks there may remain "head symptoms," such as vertigo and severe headache, or there may be palpitations or other such consequences. Neither sensory nor motor paralysis appears to be common.

Death, as the result of electricity, must occur in one of two ways:—(1) by mechanical lesions of vital structures, or (2) by arrest of organic functions essential to life; that is to say, by arrest of respiration, heart action or nutritive exchanges. It is in persons killed by lightning that the first named mechanical or "disruptive" effects are usually seen. Industrial currents kill in the second way. But even here the difference is quantitative rather than qualitative. Most of the foregoing points have been put in evidence by Kratter and others, and, as already said, are generally accepted. The first class of cases need not be considered. It is self-evident that mechanical disintegration of vital parts must cause death. But, approaching the second class of cases, where death occurs by arrest of organic functions essential to life, the question broadens out, and it becomes necessary to inquire which of such functions is struck first. Where does death begin? What is the "mechanism" of death by electricity? At this point physiologists are no longer in accord.

As it is D'Arsonval considers, that acting on nervous centers the electric current produces a variety of effects known as "inhibitory," viz., suspension of respiration, arrest of heart action, etc., and that it is the first of these that is primarily affected, inasmuch as cardiac action persists after the arrest of respiration. According to this view, there occurs, in fact, "a central paralysis of respiration, constituting a special form of asphyxia,"* due to exhaustion of the medulla and functional death of the ganglion cells. If this be correct, artificial respiration affords a hopeful means of restoring animation. This condition of suspended respiration must not be mistaken for death, and a post-mortem examination at once proceeded with. "Neoprosies vivants" is the sensational term which, it may be remembered, was used in connection with the autopsy of the first electrocuted criminals in America.

Dr. Tatum of New York, experimenting in 1890, came to the conclusion that strong currents kill by acting chiefly or entirely on the actual substance of the heart itself.

In 1895, Dr. L. Jones, having witnessed some experiments undertaken by Mr. Bokenham with reference to the amount of current required to kill anesthetized cats, considered, from an inspection of the

respiration and blood pressure tracings, that death began at the heart, and that the action of the current is "upon the heart muscle rather than upon any of its nervous mechanisms." In the *British Medical Journal* of January 15, 1893, there appears a paper by Drs. Oliver and Bolam on the same subject, arriving at the same conclusion and by the same methods, but not giving such details of amperage and voltage as would enable the experiments to be repeated by others.

Against these latter views it has been urged that were the heart's action suddenly arrested by the electric shock, there would not be the great disproportion in the amount of blood on the two sides of the heart that is present in death by electric shock. After sudden arrest of the heart's action, the amount of blood on the two sides of the heart is nearly equal.

Further, the heart theory rests chiefly on blood pressure tracings, and it is to be remembered that blood pressure is the result of other factors in addition to the action of the heart.

This leads to another hypothesis. Dr. Bleile, of the Ohio State University, suggests, as the result of carefully conducted physiological experiments, that death by electric shock is entirely due to the fact that the current produces a contraction of the arteries through an influence on the nervous system; that is to say, through an effect on those nervous centers which control the diameter of the arteries, and that a constriction of the arteries so produced throws in such an impediment to the flow of blood as the heart is unable to overcome. This last-named hypothesis no doubt contains an important truth, recognizing, as it does, the fact of peripheral obstruction as influencing blood pressure.

It is, however, contended* that the fatal obstruction is not in the systemic arterioles, but is owing to a constriction of the pulmonary arterioles, the latter being excited to contract by the entirely deoxygenized blood. Such a theory obviously falls into line with the post-mortem conditions, which, as has been seen, resemble those seen in *apnoea*.

It would, therefore, appear, not perhaps that these hypotheses are each at hopeless variance, but that death from electricity may be accomplished by various physiological mechanisms. First, and perhaps oftenest, it may be by sudden arrest of respiration; at another time it may be brought about by sudden and primary stoppage of heart action; in either case, the result being not improbably due to physiological death of the centers of respiration or circulation from chemical and morphological changes therein which present methods of observation do not enable us to recognize. Further, it is certain that these two centers act in unison, and it need not be surprising that the incidence of the damage done by the current may not always be distributed in the same way. But in accepting the foregoing, it is not to be overlooked that the view that fatal results from electric currents are due to damage inflicted within the actual structure of the heart itself is very influentially held, it has never been disproved, and may ultimately turn out to be a cause, if not the cause, of death from electricity. Thirdly, mechanical or disruptive lesions, such as tearing of blood-vessels and contusions of the surface of the brain, are not limited exclusively to accidents by lightning, but have also been observed in a modified form in cases of death from industrial currents.

It is sufficient to say that, notwithstanding the experiments of physiologists, and a growing experience of such cases, all that medical treatment can do is still to be summed up in the original formula of D'Arsonval, "Un foudroyé doit être traité comme un noyé"; in other words, by artificial respiration commenced early and continued long. But there is one further point with reference to this to which brief allusion may be made. It is known to physiologists that animals to whom nitrite of amyl has been administered are more difficult to kill by electric currents than are animals not under the influence

* From the *Electrical Review*, London.
† Kratter.

* Kratter.

* *Lancet*, October, 1895.

of that drug. It acts by paralyzing the walls of the small blood vessels, and so doing away with both arterial constriction and pulmonary obstruction. Now, without advocating that capsules of amyl nitrite should form part of the equipment of every "first-aid," it may be suggested that the use of this drug in cases such as drowning and electric shock would in safe hands prove a valuable adjunct to artificial respiration.

ON THE MANUFACTURE OF LAMPS AND OTHER APPARATUS FOR 200-VOLT CIRCUITS.*

BY G. BINSWANGER BYNG.

In the progress of electrical industry, manufacturers have become accustomed to sudden demands arising from a discovery or a successful experiment, and I purpose to deal with apparatus which manufacturers are called upon to make to meet the requirements of the latest innovation—i. e., the distribution at a potential of 200 to 230 volts. Central station engineers have thus arranged their three-wire system, relying upon makers to successfully alter lamps and minor fittings incidental to such a change. Their expectations have been fulfilled in a measure only. The ultimate success of the high-pressure system will depend largely upon the verdict of the consumer, and he will give it in its favor only if his fittings in points of efficiency, economy, safety, convenience and appearance approach the standard which he can obtain by means of the lower voltage system.

It is, therefore, of importance that the central station engineer should assist the manufacturer to arrive at such perfection. His instructions, so far, have hardly gone beyond the demand to supply him with fittings to conform in appearance to the 100-volt system. It is true each central station has issued rules, but they are of little help to the manufacturer, and their very disconformity shows that there is neither unanimity nor correlation of ideas between the engineers in charge.

What is wanted is to have a thorough interchange of opinion of engineers, contractors and manufacturers. The latter would then know theoretically how far they may satisfactorily depart from the present practice, and thus save much time and money in adventitious experiments; and this also might tend to produce some degree of standardization—much to be desired in the interest of all who have the success of the new system at heart.

With this object in view I bring this paper before you, and I think I can best serve the purpose by describing the chief appliances now upon the market, or under manufacture at my works, pointing out the existing deficiencies, and giving you my views upon the attainment, as far as possible, of higher perfection.

INCANDESCENT LAMPS.

Most important in connection with this subject is the incandescent lamp.

The lamp manufacturers have been compelled to supply 200-volt lamps at a given candle-power and efficiency, in the same size bulbs as are used for 100-volt lamps. With flashed carbon the manufacturers meet with the great practical difficulty of properly disposing their long thin 200-volt filament in the same space as their shorter and thicker 100-volt filament, and therefore most of them solve this problem by resorting to a filament of much higher specific resistance than would be given by the flashing operation.

Unflashed Filaments.—Such a lamp is ready to the maker's hand by simply taking his ordinary carbon filament as it exists before being flashed—that is to say, before it is reduced by a fresh layer of carbon being deposited on the surface of the original filament.

The higher specific resistance of an unflashed car-

bon enables one to easily get over the difficulty of size of bulb, as such a filament will give the necessary resistance by taking a shorter length. Such filaments have also a greater emissivity, owing to the darker and rougher nature of their surface, than that of flashed filaments; consequently they require a less amount of surface per candle-power, and therefore the mass of an unflashed filament, at a given candle-power and efficiency, is less than that of the flashed filament.

The filaments of high-voltage lamps largely used to-day are therefore, in other words, faster converters of energy into heat and light than flashed filaments of the same candle-power and efficiency, although the watts supplied to each be the same.

On comparing the behavior of such 200-volt lamps with that of 100-volt lamps, the roughest of tests shows that there is a far more rapid falling off of candle-power during life with the former than the latter. At the same time the efficiency of an unflashed lamp decreases in a given number of hours by a far greater percentage than is the case with the flashed lamp. Mr. Robertson has made a series of life and efficiency tests on high-voltage lamps. They show that in the average unflashed 200-volt 16 CP. lamp the percentage loss of candle-power in 600 hours is about 42 per cent., and the average drop of efficiency is about 35 per cent.

These two quantities seem to cover the chief practical merits desirable in an incandescent electric lamp—i. e., the lamp which has the best percentage retention of original candle-power during its life, together with the best average percentage (or increase) of original efficiency during its life.

These tests show that these most desirable points, which have been worked on diligently for the last thirteen years, have had to be thrown on one side in order to bring about the possibility of using the same sized bulb for a given candle-power at 200 volts as at 100 volts.

Tests of the behavior of unflashed high-voltage lamps show that such lamps sometimes increase in candle-power during the first 100 hours or so. This also happens with badly carbonized or badly flashed 100-volt lamps (noted by Prof. Ayrton in some of his recent lamp tests), owing to the initial lowering of their resistance in consequence of their not having been properly carbonized in the first instance; and this is often accompanied by a great alteration in the character of the surface (emissivity) of the filament. The carbonizing or baking process is therefore still going on in the lamp, and the two above-mentioned changes coming together mask the fact that a great deterioration of the filament has taken place; but a period is quickly reached when this fact is no longer masked. This period is when there is no further decrease of resistance; but the surface deterioration still goes on, and thus soon brings about a large percentage fall of candle-power, and on the slightest increase of voltage there is now a tendency to increase resistance. These changes seem to be initially owing to the fact that the (unflashed) high specific resistance carbon is far more volatile than is the case with a good flashed carbon.

A microscopical examination of a flashed and unflashed filament after each has been running 100 hours shows that the surface of the flashed filament is still quite smooth and shiny, whereas the surface of the unflashed filament has become very dull, sooty, and often full of small pit-holes. These pit-holes and soot form a large increase of surface, which therefore increases the emissivity of the filament, and consequently lessens its candle-power, as the watts supplied keep the same.

The property of an unflashed filament becoming so rapidly less efficient (increasing in watts per candle-power) acts as a preservative, because the increased emissivity lowers the temperature. This lowering of temperature decreases both the tendency to volatilize and also to further great change of resistance. This power of self-preservation leads to such a filament giving some satisfaction to the gen-

eral public, for the latter is satisfied when it obtains a good average, or sometimes an excessively long-life lamp; but this is very false economy, as it is only purchased by a very great falling off in actual efficiency.

Mr. Robertson's experience with carbon filaments seems to point to the fact that it is impossible to obtain a carbon filament of high specific resistance without its being accompanied by at least the defect of greater volatility. In other words, the lowest specific resistance carbon is the best, because it is less liable to evaporation, and therefore it gives the best retention of original candle-power and efficiency, and it is also mechanically stronger.

The specific resistance of many of the present types of 200-volt lamps is about 3,500 to 5,000 microhms per cubic centimeter, whereas it is easy to obtain flashed carbons whose specific resistance is as low as 2,400 microhms per centimeter; and even as low as 300 is possible, but not practicable.

Gases.—Another important consideration to bear in mind as to whether the high or low specific resistance carbon is the best is, that the high specific resistance filaments retain their occluded gases in a far more persistent degree than is the case with the low specific resistance flashed filaments.

It is probable that the occluded gases arising from the carbonization of the filament are, by means of the flashing process, driven off to a large extent; and, in addition, the more dense and impervious nature of the flashed surface prevents the filament from absorbing the gases during its subsequent handling or treatment. This absorption is a property possessed by all carbon bodies in some proportion, varying with their density.

This greater power of unflashed carbon to absorb gases and to retain what it has absorbed than is possessed by flashed carbon, leads in many instances to sudden deterioration of the vacuum in a finished lamp, accompanied by a short-circuiting as soon as the pressure and the condition of the residual gases in the bulb has reached its most conductive point.

The consensus of opinion at the present day of the average types of high-voltage lamps undoubtedly points to the fact that a large percentage are expected to short-circuit as soon as they are put up, and I have heard several engineers say that they expect about one in twelve to go in this way.

From these causes, and others relating to the treatment of filament pointed out above, there seems to be no doubt that the average 200-volt lamps have a shorter life than 100-volt lamps. The above experiences have led Mr. Robertson to design all high-voltage lamps that are not restricted by size with well-flashed carbon filaments, and such lamps compare favorably with lower voltage lamps.

Horizontal Burning.—Another question which is very important in considering 200-volt lamps is that of horizontal burning, and contractors should take special notice of this. There is no doubt whatever that almost all the present-day 200-volt lamps are only suitable for burning in a vertical position. As soon as any other position is adopted defects become prominent. The long thin filament soon drops on to the bulb and cracks it. Also electrostatic attractions, owing to higher voltage, cannot be resisted by the long thin filament, and this is an additional cause of the filament approaching the bulb.

The effect of electrostatic attractions on long thin filaments is even noticeable with lamps burning in a vertical position. Such lamps have to be designed with the object of making their filaments more rigid, and to be thus able to withstand the effects of gravity and electrostatic attractions exerted by the charge on the bulb; and this is the chief point which makes high efficiency 200-volt lamps so difficult to produce. There is, therefore, a tendency in trying to avoid the defects just mentioned to make 200-volt lamps as low in efficiency as possible.

Leading-in Wires.—Another fault that exists with the bulk of the present forms of high-voltage lamps is that, owing to the same size bulb being retained,

* Paper read before the Institution of Electrical Engineers, London, Eng., Feb. 24, 1898.

no greater separation can be given between the leading-in wires of the lamp. This is a special difficulty with high-voltage lamps which contain two filaments, as in this case the same size cap is used, and four wires are passed through the sealing point instead of two, and they are therefore more crowded together. This question of distance apart of leading-in wires is a vital one, both in the manufacture of the lamp and in its after use. In the case of unflashed carbons this becomes a still greater defect, owing to small distance combined with probably greater gaseous emanation.

The higher the voltage, the sooner are these defects made manifest. Even with 100-volt lamps there is, under certain conditions, a tendency for current to jump across from pole to pole, owing to the remanent gases in the bulb attaining a high state of conductivity. The greatest conductivity of the remanent gases which lead to sudden short-circuiting appears to be when the pressure is about 0.01 mm. But, by reason of a continued discharge taking place in all lamps, there seems to be a tendency for the residual gaseous molecules to arrange themselves in a straight path between each pole. Through such a path discharge will take place even in a better vacuum than 0.01 mm.

This leakage current (sometimes called the "Edison effect") which leads to short-circuiting is very prominent during manufacture of high-voltage lamps, and to avoid it greater care is required as the voltage increases.

If the size of a bulb for a high-voltage lamp is to be restricted to the present dimensions, there is no doubt that the best lamp would still be that which has a single filament, were it not that other vital questions step in.

Electrostatic effects also increase with the voltage, and several most promising patterns of lamps, from all other points of view, have had to be put on one side on this account.

As to the best forms of cap for high-voltage lamps, preference will naturally be given to those in which the poles can be kept furthest apart.

If a B. C. or E. S. cap were on a larger scale, there is no doubt that considerable benefit would accrue. The simplest holder, with the least moving parts and for always making the best contact, is undoubtedly the Edison screw, which, in the cases of excessive vibration, can be made with a locking device.

The slightest want of insulation in the cap between the poles eventually leads to a large leakage current between them or the cap and one of the poles, and in many cases this is suddenly established to such a large degree as to result in the complete fusion of the lamp cap, and sometimes the holder. In such cases a non-metallic lamp cap seems to offer great advantages, and has, in my experience, removed complaints on this score.

Standard Voltage.—From a lamp maker's point of view, a fixed standard of voltage and efficiency would only lead to an increased cost in manufacture, and the present practice of varying efficiencies with voltages, running in the case of low-voltage lamps from 95 to 120, and in the case of high voltage lamps from 200 to 230, tends to keep the lamp at a lower cost than if these efficiencies or limits of voltage were more restricted.

On the other hand, voltages which lie outside these limits are a source of great expense to the manufacturer. It would therefore tend to cheapen lamps if a standard of voltage were adopted which lay exclusively between the above or even smaller limits, but at varying efficiencies.

Combination Filaments.—In order to get over the difficulty of size of bulb, etc., many filaments (beyond the unflashed pure carbon derived from cellulose in some form) have been introduced which have a high specific resistance. This can only be obtained by using a less dense form of carbon than has hitherto been found most satisfactory in low-voltage lamps.

A form of high specific resistance filament that has been tried is where the carbon has been admixed

with various oxides, borates and silicates of the earths. In addition to mixtures, electrolytic and chemical deposits of these bodies on the surface of carbon have been tried; but, although it is a simple matter to obtain baked carbons containing these bodies, either incorporated with the carbon or on the surface thereon, it is quite another matter to obtain a finished lamp containing these bodies in a form to be of any practicable use. The difficulties met with are apparent as soon as the lamp is incandescent while undergoing exhaustion.

If such lamps be incandescent to a temperature exceeding 5 watts per candle-power, there is a gradual separation by evaporation of these bodies from the carbon, and their resulting deposition on the surface of the lamp bulb.

The temperature of incandescence of the filament in order to obtain any advantage which might be derived from the "luminescence" of the rarer earths is apparently greater than 5 watts per candle-power; and, as above stated, it has been found impossible to so evacuate a lamp as to leave any of the "luminescent" bodies incorporated with the filament at temperature higher than 5 watts per candle-power; the object sought for is consequently defeated.

From the above it seems that, with our present knowledge, the best form of 200-volt lamp is that which has a well-flashed low specific resistance pure carbon filament in a large bulb, with a well-insulated moisture-proof cap allowing the poles to be placed at a reasonable distance apart. It should consist of a single filament, and be so disposed in the bulb that it can withstand the disturbing effects of gravity and electrostatic charges on the bulb.

I wish to mention here that my co-director, Mr. Robertson, has given me great assistance in the remarks I have made upon lamps.

(To be continued.)

ELECTRICAL ENGINEERING IN SPAIN.*

Mazarron, a provincial town of some 14,000 inhabitants, is situated in the southeast of the province of Murcia, and is the most important center of the mining district of the southeast coast of Spain, midway between Carthagena on one side and Aguilas on the other. The town of Mazarron is approached from the Mediterranean by the "Puerto de Mazarron," or port, which latter has a population of 3,500 inhabitants, and is under the same municipal government as the town itself. The port is 6½ kilometers distant from the town, and the Mazarron Electric Light Company intend shortly to extend their high-pressure cables from the generating station at Mazarron, in order to supply the light also to the port, the lighting of which is included in their concession. The exclusive concession for the electric lighting of Mazarron for fifty years was obtained by the Mazarron Electric Light Company (Limited).

In Mazarron, as in most provincial towns in Spain, the only illuminant obtainable is petroleum, and in consequence of the very high price of this illuminant in the country, due to heavy Government taxes on its introduction, refining and consumption, the danger in its use and the difficulty in procuring the thoroughly refined oil, except at excessive prices, afford special advantages to electric light undertakings—a fact which can be seen by the rapidly increasing number of concessions being taken by the English and other companies for the supply of electric light to Spanish towns.

The contract of the Mazarron Electric Light Company with the municipality of Mazarron was concluded in May, 1897, and already the equivalent number of lamps of 10 CP. connected up is over 1,000, the present plant being capable of supplying 3,500 lamps of 10 CP. The municipality at present use 300 lamps, including 10 CP. and 16 CP. glow lamps in the streets of the town, and one 2,000 CP. arc lamp in the plaza or market-place. For these they pay at the rate of 50 centimos per 1,000 watt-

* From the *Electrician*, London.

hours, or, taking the mean of the rate of exchange, equivalent to about 4d. per British B. O. T. unit. The price paid by private customers is at the rate of 6 pesetas per month per 16 CP. lamp if by contract, or if by meter, 80 centimos per 1,000 watt-hours, which in a similar manner averages 6.4d. per British B. O. T. unit. The cost of the same intensity of light as that of one 16 CP. incandescent lamp, if produced by the ordinary petroleum obtainable in the town, is about 7 centimos of a peseta per hour; while the present charge to private consumers for the electric light is equivalent, at the above rate, to 5 centimos per 16 CP. lamp-hour. Thus the advantages in economy and superiority of the electric light over petroleum are at once evident to the residents, rich and poor, and the light is being rapidly taken up by all classes.

The system adopted at Mazarron has been the high-pressure alternate current system, with transformers, the motive power adopted being steam, in consequence of the absence of any available water power in the neighborhood. The alternators are of the well-known Mordey-Victoria pattern of 2,000 volts, 100 periodicity, with direct-coupled exciters, constructed by the Brush Electrical Engineering Company (Limited), and at present the plant comprises two alternators of 30 kilowatts each, and one alternator of 35 kilowatts, intended for parallel working. The engines include a 60 HP. vertical compound high-speed engine built by Messrs. Robey & Co., Lincoln, with Pickering governor and variable expansion gear, and a 60 HP. locomotive type of boiler by the same makers. Messrs. Hornsby & Sons, of Grantham, have supplied a 75 HP. under-type automatic expansion engine and boiler, and this latter engine at present drives one of the 30 kilowatt alternators by link-belt and jockey-pulley gear. The third alternator is at present kept for reserve.

The power station is situated at the extreme north-east of the town, a more central position having been unobtainable. From this station the line of cables is carried overhead, the high-pressure feeders and cables being rubber-insulated and carried on specially constructed insulators attached either to upright posts or to wall brackets. The low-pressure house service system is similarly carried in lines of aerial cable with insulated covering and special porcelain insulators. At present there are nine transformers working on the town circuits, the units chosen being mostly 2 and 3 kilowatt transformers arranged in parallel and feeding the low-pressure network. The transformers are placed in overground chambers in the streets in convenient situations, and at each transformer-box a distributing post is fixed, to which also is attached the branch cables connecting with the high-pressure feeders, these, of course, entering the transformer chamber. The transformers were supplied by Messrs. Crompton & Co., and by Messrs. Johnson & Phillips. In consequence of the phenomenal dryness of the climate in Mazarron, rain rarely falling throughout the whole year, and the intense heat, it has been found quite easy to effect perfect insulation of transformers and overhead circuits; and the overhead system has been universally adopted in such parts of Spain as it gives the best results with the greatest facility and cheapness of construction.

The old form of petroleum lamps, or "faroles," in the market-place have been replaced by a 2,000 CP. alternate-current arc lamp, connected through a supplementary arc-lamp transformer to the house service line, which is worked at 110 volts throughout the town. The company have already supplied light to the San Jose mine; and it is expected that contracts will be entered into shortly with the other mines in the district for supply of the light both above the surface and underground. The great industry of Mazarron is that of the mines, which lie immediately round, many being partly within the town itself. These mines are among the richest in the country and in Europe in lead and silver, the lead ore being conveyed for smelting to the lead works at the port, from whence it is shipped to England and abroad.

LONDON NOTES.

[From our London Correspondent.]

Alternate Current Motors.

Mr. Llewellyn B. Atkinson has been reading a paper before the Institution of Civil Engineers, London, on the theory, design and working of alternate current motors. The author dealt mainly with asynchronous motors. The principles of alternating currents, so far as necessary for their use in alternate-current motor design, were explained, and the method of graphically making the necessary calculations was illustrated. In his classification Mr. Atkinson took as the first class motors in which the energy was conveyed to armature through brushes, and which were therefore called "conductive motors," which might be series wound, shunt wound, or separately excited; in the latter case the phase of the EMF. producing the exciting current differed by a quarter period from that producing the armature current, thus forming an example of the application of multiphase currents to alternate-current motors. The transformation of energy from one circuit to another by electromagnetic induction instead of by conduction was considered, and the working of transformers both with magnetic leakage and without magnetic leakage between the primary and secondary windings was illustrated. This gave rise to a class of motors in which the energy was supplied to the armature, not through the brushes, but through the air gap; these motors in the simplest form having, however, a commutator for short-circuiting the coils so as to produce a proper distribution of current in the armature. These motors the author classed as "inductive motors with brushes, having one inductive electric axis and one magnetic axis." A modification of this class furnished a third class, "inductive motors with brushes," in which there were "two reciprocal inductive electric and magnetic axes." The brushes might then be dispensed with, giving rise to a class of "inductive motors without brushes, having short-circuited coils and two reciprocal inductive electric and magnetic axes," the modern induction motor. The theory of such motors was examined, and the use of asynchronous motors as generators was touched upon. The design of alternate current motors and the practical construction and working of asynchronous motors also formed part of the paper.

The Dublin Three-Phase System.

Mr. H. F. Parshall has just read a paper before the same institution regarding the operation of the Dublin electric tramway system since its inauguration two years ago. As originally designed, the Dublin Southern Tramways would not conform with the Board of Trade regulations in the matter of fall of potential in the earth return. The machinery had been ordered and the work proceeded with before Mr. Parshall was called in to advise. The problem became, therefore, to utilize as much of the machinery ordered as possible, and to install such other machinery as would be necessary to distribute the electricity under the Board of Trade regulations. The high-tension, alternate-current method of transmission was considered most suitable. It was necessary to make use of the sites owned by the tramway company and to execute the work as cheaply as was consistent with safe operation. The three-phase machines and switchboards were specially designed for the installation, which was the first one of its kind established in the British Isles. The installation has been in operation—entirely satisfactorily—for nearly two years. So simple is the operation of the substations that only a boy is employed in each to work the machinery. Owing to the low frequency the motors were very easily synchronized, and even though they were thrown in considerably out of phase, they quickly fell into step. Numerous additional cars increased the load greatly, but the machines never gave trouble, nor have the asynchronous motors fallen out of step, even in the case of

most severe loads. The Board of Trade requirements had been satisfactorily met, and owing to the number of points of distribution it was possible to work some sixty cars on the line instead of twenty as originally designed to comply with the Board's regulations. As originally designed the fall in potential in the earth return would have been some 18 volts to 20 volts, whereas in the present plant it was 3½ volts. At the time the installation was designed, twenty cars were contemplated, but it had since been found profitable to work as many as fifty on the line, even though the line had been subjected to the disadvantage of not having a thorough connection to the center of Dublin. Owing, therefore, to the largely increased load, the capacity of the powerhouse at Ballsbridge had been greatly added to by a large direct connected unit which was more suited for heavy traction loads. Likewise the substation at Blackrock had been redesigned and in the place of the 60 K.W. motor-generator sets originally installed there are now two 200 K.W. rotary converters, with the necessary static transformers, and an improved switchboard for manipulating it. The principal point of importance is the ease and reliability with which such a system is shown to be operated. The efficiency of the system was shown by Mr. Parshall, by the working cost, to be satisfactory, although the efficiency of the machines in substations was not so high as would be the case with larger machines and large rotary converters. For a small tramway, however, the sureness of operation and the minimum of labor were of vastly greater importance than any small gain in efficiency.

Amateur Model-Making Competition at the Electrical and Kindred Industries Exhibition.

A committee consisting of Prof. Morris Loch, Dr. C. A. Doremus, Dr. W. E. Geyer and Mr. T. C. Martin has drawn up rules and regulations for an amateur model-making competition in connection with the Electrical Exhibition. Printed forms can be had from the management, 15 Cortlandt street, New York. The classes are given below, each class having prizes not to exceed \$50, and bronze medals, the exhibits to be judged by a committee of five well known men. It is believed that the contest will awaken general interest and elicit some beautiful and interesting apparatus. There are a great many young people and students in and around New York who find pleasure in handiwork of this character. The classes are as follows, and the exhibits must be entered a week before the Exhibition begins:

Class A.—Working model or actual machine of a dynamo-electric or electro-dynamic type; made by one or more boys under 21, so far as designing, lathe work, assembling and finishing are concerned.

Class B.—Instrument of precision, made by amateur or student; including galvanometers, resistance bridges, etc., etc.

Class C.—Practical application of electricity to communication, the assembling and finishing to have been the work of a single exhibitor.

Class D.—Ingenious application of electrical appliances to domestic, etc., uses, by an amateur under 18; none of the apparatus to be necessarily of home manufacture.

Class E.—Design or working drawing of an electrical appliance or installation, made within the past twelve months, by a student of a recognized chartered institution and bearing the instructor's certificate as to its bona fides.

Class F.—Design or instrument made by a teacher below the grade of college professor, for illustrating some electrical law.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

BOOK REVIEWS.

A POCKET DICTIONARY OF ELECTRICAL WORDS, TERMS AND PHRASES. By EDWIN J. HOUSTON, Ph.D. 950 pages. Published by the American Technical Book Company, 45 Vesey street, New York. Price, bound in leather, \$3; bound in cloth, \$2.50.

This work has been brought thoroughly up to date, and for clearness and conciseness is far in advance of any of the previous editions. The words, terms and phrases are arranged in alphabetical order, the definitions being given almost invariably in a few short concise sentences. No cross references are employed, the terms being arranged alphabetically in their natural order.

The value of this work will be appreciated when it is stated that it contains 11,000 electrical terms and words, or 6,000 more than the previous edition. In a growing science such as electricity, new words and terms are constantly appearing the meaning of which is not always clear. For speedy reference this work is invaluable, as owing to its size it can be carried in the pocket or kept ready at hand. As the dictionary was compiled solely with a view to furnishing concise definitions, technical students or those who desire a lengthy explanation will find it greatly to their advantage to obtain a copy of the complete fourth edition, containing encyclopedic matter and a system of cross references.

For the practical engineer and business man, however, the Pocket Dictionary fills a long felt want, as it is unquestionably the most complete and reliable electrical dictionary that has ever been published.

ALGEBRA MADE EASY. By EDWIN J. HOUSTON, Ph.D., and ARTHUR E. KENNELLY, Sc.D. 100 pages. Published by the American Technical Book Company, 45 Vesey street, New York.

This valuable little work, as is stated in the preface, was compiled for the purpose of elucidating the mathematical formulæ which appear in the pages of Prof. Silvanus P. Thompson's "Dynamo Electric Machinery" and "Polyphase Electric Currents." Although it contains nothing strikingly new, the principles of algebra, geometry, trigonometry and calculus are so simply yet clearly set forth that a person cannot help but grasp their meaning.

In carrying out the stated object of this publication, the authors have produced a work that is well worth studious perusal by the younger element of the electrical profession, and by some of the older members as well. The title of the book, in our opinion, should have been *Mathematics Made Easy*, for it covers almost the whole field in a lucid and admirable manner.

THE UNIVERSAL ELECTRICAL DIRECTORY (J. A. BERLY'S). Published by H. Alabaster Garhouse & Co., 4 Ludgate Hill, London. 1,100 pages. Price, 6s.

This valuable work as the title indicates is brought out at the beginning of each year for the purpose of enabling a person to find the address of any firm manufacturing electrical apparatus of any kind in Europe, America or in the colonies of Great Britain. The seventeenth edition, which has just made its appearance, contains 23,794 names of members of the electrical and kindred industries throughout the world.

This is 1,136 more names of individuals and firms than were contained in the 1897 issue of the Directory.

This last edition has been most carefully revised and brought up to the date of issue, the British alphabetical section now comprising 9,918 names, the Continental 7,872 names, the American 4,080 names and the Colonial section 1,924 names.

For facility of reference it is divided into four groups, namely, British, Continental, American and Colonial, which are again subdivided into alphabetical and classified sections. In the case of the British a geographical section is given, making in all nine subdivisions.

In addition to the new names incorporated in the

present issue, much financial information is given which should prove of value. Telegraphic addresses as well as local telephone numbers are also given, 70 pages having been added to the 1897 edition. This Electrical Directory is unquestionably the largest and probably the most comprehensive in the world.

The book is handsome in appearance and should prove invaluable to persons engaged in electrical and kindred industries. As the price is but \$1.25, it is well within the reach of all.

A SPECIAL PRIZE OFFER.

Theses Competition for Students.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to *ELECTRICITY*.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For Electricity's Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of *ELECTRICITY*, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and wherever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of *ELECTRICITY* duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all theses submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of *ELECTRICITY*, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we should like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not thoroughly clear, we will be pleased to answer any inquiries relating to this matter.

Help to fight the Electrical Trust by subscribing for *ELECTRICITY*.

CANADIAN NOTES.

The Dominion Government will be asked to make an appropriation at the present session of Parliament for the extension of the Government telegraph system to the Yukon country. At the present time the Government telegraph line extends from Ashcroft, B. C., to Quesnelle, a distance of 225 miles. From the latter point to Telegraph Creek is 54 miles. The proposal is to build the section to Teslin Lake next season, reaching the Yukon in 1899. The cost is roughly estimated at \$500,000.

The C. P. R. Telegraph Company now proposes to stretch a copper telegraph wire from Montreal to Vancouver, B. C. It will then be possible to sit in the Montreal office and transmit messages to Vancouver direct. The wire to be used will weigh 300 pounds to the mile, and the total weight of copper wire to be used will be something like 450 tons. Work is expected to begin on the new line on the 1st of April, and to have the line completed and in working order by the 1st of June. Construction work will commence at the Montreal end. The copper wire to be used in the enterprise will alone cost in the neighborhood of \$250,000. The wire will be worked duplex.

At the next session of the Manitoba Legislature a local company will ask for a charter to build an electric railway from Winnipeg to St. Andrew's Rapids, and through the municipalities of Springfield, St. Boniface, Kildonan, St. Paul's and St. Andrew's. The company also proposes to construct sawmills, boats, telegraph and telephone lines.

From the plant which the West Kootenay Electric Light & Power Company is erecting at Bonnington Falls, B. C., it is expected that the transmission of power to the Rossland mines will be commenced this month. Bonnington Falls, where the power house is situated, lies about 11 miles below Nelson, B. C., on the Kootenay river. Water is conducted to the reservoir from the river by a canal 22 feet deep, cut out of rock for a distance of 640 feet. The two turbine wheels are attached directly to the generators. There are two generators, having together a capacity of 2,500 horse power. They operate at 180 revolutions per minute.

NATIONAL ELECTRIC LIGHT ASSOCIATION.

The June Meeting.

At a meeting held in Chicago last week many plans and suggestions were considered by the gentlemen invited to confer with President Insull upon the arrangements for the entertainment of visitors during the Convention of the N. E. L. Association, June 7, 8 and 9, at the Auditorium Annex, Chicago. The banqueting hall which has been secured for the session is one of the finest meeting rooms in the country. Space will be furnished for the exhibits in the hotel parlors and basement. There will be no general exhibit, the manufacturing and central station interests agreeing upon that point. President Insull announced that the plant of the Chicago Edison Company would be open to inspection at all times during the meeting, and that every facility would be afforded members to examine the practical workings of the system. He said that the company would also afford facilities for manufacturers to display their apparatus and specialties in actual operation in the Edison station. In other words, the Chicago Edison Company will keep open house for the Association during the Convention. Assurances were received from the street railway companies, and the elevated as well, that they would co-operate with the lighting interests in giving the visitors an idea of the advancement that has been made in the electrical development of Chicago since the last meeting in that city. It was also suggested that a visit to the drainage canal would be interesting, especially to the Eastern visitors. It is proposed to hold morning and evening sessions, devoting the afternoons to entertainments and sightseeing. This plan has been tried at the Edison Conventions and has proved satisfactory and popular. No definite action was taken

on any of the plans suggested, as it was deemed expedient to await the result of President Insull's conference with the Eastern representatives. Another meeting of the Chicago committee will be held on Thursday, March 24, at which time the views of the Eastern members will be presented and definite action taken.

COMMUNICATIONS.

The Warren Electric Company Receivership.

Warren Electric Manufacturing Co.,
Sandusky, O., Mar. 11, 1898.

Editor *ELECTRICITY*.

DEAR SIR: Having observed in the columns of the *Electrical Review* under date of March 9th an article stating that the president of our company at Sandusky, O., had put the concern in the hands of a receiver, and thinking that perhaps your journal might pursue the same course, we write to inform you that the article is misleading in every respect and not warranted by the wording of the press dispatches detailing the account of the receivership for the Chicago company. The enclosed letter states explicitly the facts and reasons for the action.

We trust that in case you make any allusions to the affair you will give a correct statement. Yours truly,

WARREN ELECTRIC MFG CO.
C. C. WARREN, Pres.

ENCLOSED LETTER.

Sandusky, March 11, 1898.

In explanation of the appointment of a receiver for the Warren Electric Co. of Chicago, Ill., I will state that it has no possible connection with the affairs of the Warren Electric Manufacturing Co. of Sandusky, Ohio, and was an action applied for by myself, and seemed the only method by which the following claims (the only ones against the company) could be protected: first, of certain bank paper on which I was personally an endorser; second, the claim of a member of my family solely for services; third, a claim I personally held for a considerable sum of money which I had advanced to the company; but most important, a receivership seemed to be the only means found by which H. J. Medbery of Mechanicsville, N. Y., the treasurer of the company, could be made to account for and disgorge the funds in his possession as treasurer, and compelled to apply the same to the reduction of the outstanding obligations named above.

The action was precipitated by an attempt on the part of Medbery and three others of like ilk to take actual possession of the legal organization of the Illinois company; to conduct it bodily to the State of New York; to make it the basis of a scheme by which they might manufacture the Warren Alternator in competition with the Sandusky Co., to whom the sole right to the Warren patents and the exclusive license to manufacture was granted by an assignment and contract more than a year and a half ago.

The legal right by which these four high-minded, self-constituted directors attempted to justify their nefarious scheme existed solely in the actual gift by myself of stock in the company of a sufficient amount, which, by manipulation, enabled them to capture four out of seven directors.

In extenuation of my act of placing stock in the hands of such persons, I can only say it must have been at a time when my benevolence vastly outweighed good judgment. Yours truly,

C. C. WARREN.

The Standard Diagrams.

The Chicago Electrical Association has published the report of the Association's Committee on Standard Diagrams in pamphlet form, with a view to having it in convenient shape for the use of electrical draughtsmen and patent attorneys. To cover the expense of printing, a nominal price of 10 cents each will be charged. Those desiring copies of this attractive pamphlet can procure them by addressing Mr. J. R. Gravath, 825 Monadnock Building, Chicago.

The General Electric Company owed on January 1, 1898, \$1,389,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

LEGAL NOTES.

The Edison Electric Light Company having filed a petition in the U. S. Circuit Court at Pittsburg, Pa., asking an injunction and restraining order on the Doubleday Electric Company from manufacturing and selling an electric socket claimed by the plaintiff, the court issued the restraining order asked for pending a hearing of the case.

Judge O'Neill, at Eau Claire, Wis., on the 5th inst., made an order requiring R. E. Rust, receiver of the National Electric Manufacturing Company, to turn over all books and vouchers to the court. This is the result of a petition for a general overhauling of all receivership proceedings, involving about \$100,000.

The Barden-Sheets Electrical Construction Company, composed of E. T. Barden and Charles W. Sheets, filed a deed of trust in the county clerk's office at Galveston, Tex., on the 3d inst. The company's main office is in Houston, with a branch house in Galveston. The instrument, which is intended as a mortgage to better secure the payment of certain sums of money, conveys to J. M. Kilburn of Houston, in trust, all the stock of electrical supplies in both the main and branch establishments, to sell same within sixty days and complete the contracts now on hand. Out of the money received the trustee is to pay the expenses of the execution of this trust and then certain creditors in the order and amounts specified. Among the creditors specified are: Washburn & Moen Manufacturing Co., notes aggregating \$1,400; W. S. Edwards Manufacturing Co., note \$250; New York & Ohio Company, two notes, each \$200; Western Electric Company, account, \$39.95; Electrical Appliance Company, account, \$11.35; Interior Conduit & Insulation Company, account, \$107.70; General Incandescent Arc Light Company, account, \$254.26; Central Electric Company, \$100.

The National Conduit Company of New York has filed a complaint in the office of the clerk of the United States Circuit Court against Talcott H. Russell, receiver of the Connecticut Pipe Manufacturing Company of New Haven, Conn., alleging an infringement of a patent covering the manufacture of a specially constructed conduit pipe for the carrying of electric wires underground. The complaint alleges that the invention was made by Edward Phipps of New Haven and that he had assigned the patent to Edward S. Perot and James P. McQuaide, who formed the National Conduit Company which manufactures the conduits. The writ is returnable at the next term of the court.

Charles C. Warren of Sandusky, O., has asked the Superior Court, Chicago, to appoint a receiver for the Warren Electric Company and to dissolve the company. The capital stock is \$50,000 and the officers are Charles C. Warren, president; H. B. Warren, secretary, and Horace J. Medbery, treasurer. In January, 1897, the court is told, the company leased all its rights and certain patents to the Warren Electric Manufacturing Company of Sandusky, O. At that time the company had an outstanding indebtedness of \$12,500, of which \$8,500 was represented by notes indorsed by the complainant and H. J. Medbery as treasurer. The notes were payable to the First National Bank of Balston Spa, N. Y. The complainant also alleges that \$2,500 was due him on account of salary and money advanced for the payment of debts. According to the complainant, the total assets of the company will not exceed \$6,000 and the liabilities are \$12,000.

The report of the receiver of E. S. Greely & Co. of New York City, presented in court at New Haven on the 11th inst., shows \$104,096 available for dividends and allowed claims of \$173,726. There will be a dividend of about 60 per cent. and the business of the company will be closed up.

Nellie E. Judge, administratrix of Patrick J. Judge, has received a verdict of \$13,375 in her suit against the Narragansett Electric Lighting Company for \$15,000, in the Court of Common Pleas for Providence County, R. I., founded on a claim for damages as the result of her husband's death.

THE NEWS.

What Is Going On in the Electrical World.

STREET RAILROADS.

Amesbury, Mass.—The board of selectmen has granted a franchise and location to the Amesbury & Hampton Street Railway Company.

Annapolis, Md.—A bill has been introduced in the Senate to incorporate the Princess Anne & Deal's Island Light, Power and Railway Company. The company proposes to construct an electric railway from Princess Anne to Deal's Island. The line is to be 20 miles long and will pass through St. Peter's, Dames Quarter and other villages in that thickly populated section. Thos. H. Brock, Wilmer O. Lankford, S. Frank Dashiell, Charles W. Hayman and H. Fillmore Lankford are named as the incorporators. The capital stock will be \$40,000. It is stated that the construction of the road will begin immediately after the passage of the bill.

Charleston, S. C.—The "News & Courier" states that the mission of Dr. J. S. Lawrence to New York in the interest of the Charleston & Seashore Railroad was successful, and the necessary money to build the road has been secured.

Corsicana, Tex.—Bright Tindall and associates have been granted a franchise for a street railroad over all the streets of the city, two miles of the lines to be completed and in operation in twelve months.

Dayton, O.—At present there are six different companies asking for rights of way into this city. Four of the companies are the Dayton & Western which is building a road from here to Eaton, a distance of 25 miles west; the Dayton, Springfield & Urbana; the Miami & Piqua, and the Dayton, Troy & Piqua. These companies are backed mostly by foreign capitalists. The county commissioners have granted a franchise and right of way through this county to the Dayton, Troy & Tippecanoe Electric Railroad Company for a period of 25 years. The route is over the new Troy pike from North Dayton to Chambersburg and Vandalia in this county and thence to Tippecanoe and Troy in Miami County.

Delaware, O.—The Delaware Street Railway has been sold by the receiver to B. W. Brown and associates for \$24,000, about one-third of the original cost.

Denver, Col.—Negotiations for the consolidation of the Denver Consolidated Tramway Company and the Denver City Railroad Company have been going on for some time, and the indications now are that the consolidation will be effected at an early day.

Huntington, N. Y.—The Long Island Railroad Company has purchased the Huntington Railroad and will change it into a trolley road.

Kenosha, Wis.—The city council has passed an ordinance which welds the last link in the most extensive interurban electric railroad line in America. Within a few months it will be possible for a trolley car to travel uninterruptedly from Chicago to Green Bay, Wis., a distance of 201 miles. The electric line parallels the Milwaukee Division of the Chicago & Northwestern Railroad.

Lewiston, Me.—The "Journal" advocates the building of a trolley road around Lake Auburn, and says everybody is agreed that it would pay except possibly the owners of the Lewiston & Auburn Electric Street Railway Company.

Lowell, Mass.—The bill before the Legislature for the incorporation of the Lowell, Acton & Marlborough Street Railway Company names the following as incorporators: Louis P. Howe, Herbert E. Bradford, Patrick F. Sullivan, Henry M. Chamberlain, Oren P. Walker, James F. Bigelow, Abel G. Haynes, Henry S. Perham, Luther Conant and William N. Davenport.

Mamaroneck, N. Y.—The local board of trustees has granted a hundred-year franchise to the Tarrytown, Mamaroneck & White Plains Electric Railway Company, which gives the company the right to operate a trolley line over the various streets in this village. It also gives it the privilege to carry freight between certain hours of the day. This company now operates a line from Tarrytown to White Plains and this franchise will give it a direct route from the Hudson River to Long Island Sound.

Newark, N. J.—The city council has passed the ordinance giving the Consolidated Traction Company the right to lay tracks in Chestnut, Miller and Vanderpool streets.

New York.—The Metropolitan Street Railway Company has completed the conduit work on the Madison Avenue line, and cars operated by the underground trolley now run from the City Hall to the terminus at 135th street.

New Haven, Conn.—The "Register" says: "Capitalists from New York, Boston and Providence, representing a syndicate who operate several electric railways in New England, have been in consultation with the corporators of the People's Tramway Company of Danielson with reference to the purchase of its charter and the building of an electric street railway connecting the towns of Putnam, Killingly, Brooklyn and Plainfield. If the proposition of the corporation is accepted, the road will be built at once from Putnam to Danielson, and later from Danielson to Moosup via Brooklyn."

Portsmouth, N. H.—The stockholders of the Ports-

mouth & Dover Railroad at a meeting on the 7th inst. voted to equip the line with electricity.

Richmond, Va.—The Governor has signed the bill allowing the Richmond & Petersburg and the Petersburg Railroad Companies to consolidate under the name of the Atlantic Coast Line Company.

LIGHTING PLANTS.

Chicago, Ill.—Twenty-two hundred arc lights will be installed in the city of Chicago during 1898. Recently the city council finance committee voted \$150,000 for the extension of the municipal lighting system and a separate fund for maintenance. It is announced now that the entire street lighting department will be turned over to City Electrician Ellicott. If this project is carried out Mr. Ellicott will have charge not only of the electric lights, but of all the gas lights as well. With the installation of the electric lights, several times that number of gas lamps will be discontinued, and it is the intention of Mayor Harrison and Commissioner McGinn to put all of this work in the hands of one man if possible.

Cloverdale, Cal.—A fire at the electric light works here on the 1st inst. caused damage to the plant estimated at \$7,500.

Columbus, O.—Sealed proposals will be received by James A. Fanning, the clerk of the Board of Public Works of the city of Columbus, until 12 o'clock noon, March 24, for furnishing the labor and materials for the construction of an electric light plant for the city, in accordance with the plans and specifications on file with and to be obtained from H. M. Lyman, superintendent of lights, City Hall, Columbus.

Dodgeville, Wis.—The city council has granted a ten-years' lighting franchise to W. H. Earl of Chicago, the cost of arc lights to the city to be \$100 a year.

Hodgenville, Ky.—A company of Sydney, O., about to establish a wood factory in this place, will also put in an electric light plant for the town.

Hoboken, N. J.—The board of freeholders of Hudson County will receive bids until 4 P. M. on the 21st inst., for lighting the Weehawken branch of the Hudson Boulevard for a period of sixty days, using the wires and lamps now in position; the bids must be per light per diem.

Lancaster, Pa.—The Lancaster Electric Light, Heat & Power Company, which has the contract for lighting the streets of this city for the ensuing five years, is erecting an additional power plant for the purpose of establishing a commercial system. The company will erect a large building, into which all of the wires from their Slackwater and Rock Hill power plants, on the Conestoga creek, will be run, and from which direct current will be issued to various points. The company proposes lighting the villages about Lancaster and the Millersville State Normal School, as well as establishing a commercial system.

Macon, Ga.—The Atlanta journals in noticing the electric headlights placed as experiments on two of the locomotives of the Seaboard Air Line Railroad, stated that they were the first used in the South. The "Telegraph" says "Atlanta is mistaken. The Georgia Southern & Florida Railroad has been using electric searchlights on its engines for six years with the utmost satisfaction."

McKeesport, Pa.—The McKeesport Electric Light Company has purchased the plant of the Duquesne Heat, Light & Power Company and will furnish light and power to both towns. The capacity of the McKeesport plant has just been greatly increased, and the company capitalized at \$150,000. Horace Crosby is president and Homer Stewart secretary.

Mt. Pleasant, Ia.—This town doesn't find municipal ownership all it promised to be. The operating expenses of the electric light plant for January exceeded the receipts by \$150.

Omaha, Neb.—Consulting Electrical Engineer Steiringer is busily engaged in working out the details for the lighting and ornamental illumination of the Exposition grounds. Mr. Steiringer says that he has a more enthusiastic conception of the possibility of fine and entrancing effects in the buildings and grounds than even that which he had at first. "The setting up," he says, "is superior in every way to anything heretofore projected in this line."

Plainwell, Mich.—The town council has adopted a resolution in which they say it is expedient for the village to buy, or construct, and operate an electric light plant.

Sac City, Ia.—At the recent special election this town voted by a large majority in favor of putting in an electric light plant.

Stromsburg, Neb.—The business men of this place have come to the conclusion that an electric light plant would add to the prosperity of the town.

Suffolk, Va.—The town council has instructed a committee to visit Greensboro' and High Point, N. C., inspect the electric-light plants at those places, and report as to the advisability of the town of Suffolk putting in a similar plant.

Tooele, Utah.—The people are discussing a proposition to bond the town for \$10,000 in order to get an electric light plant started. The matter, it is believed, will go through.

Ventura, Cal.—The preliminary steps have been taken by the town trustees for a special election to bond the

city for an electric light plant to cost \$20,000. The private plant here was burned on January 20th.

TRANSMISSION PLANTS.

Helena, Mont.—In a few weeks the big turbines at Canyon Ferry will begin to revolve and the electrical power generated there will be transmitted to this city and to East Helena, the distance being about 17 miles. J. T. Fanning, of Minneapolis, the consulting engineer, who designed the dam, power house and hydraulic machinery at Canyon Ferry, has inspected the plant and says it will compare with any transmission plant in the country with the possible exception of that at Niagara Falls.

Pittsfield, Mass.—The present owners of the woolen mill property at Glendale propose to utilize the water power attainable at that point in the operation of an electric plant to furnish motive power for an extensive electric railroad system reaching from Pittsfield through Richmond and West Stockbridge to Great Barrington, and also to supply power, light and heat to firms in the central and southern part of the county. A company is to be organized and incorporated under the Massachusetts law with a capital of \$50,000.

Randolph, Utah.—Salt Lake parties have been examining Swan Creek with a view to selecting a favorable site for an electric plant from which to light all the larger towns in Bear Lake Valley, that is, Paris, Montpelier, Bloomington, St. Charles, Laketown, Garden City and others.

Shell Lake, Wis.—The business men are considering plans for electric power and light for this city. An effort will be made to secure a water-power on Yellow river, four miles distant, where a large dynamo will be placed and the current transmitted to Shell Lake.

Waterville, Me.—The Waterville & Fairfield Electric Light & Power Company having failed to meet the requirements of the conditional charter granted to the Union Gas & Electric Company, the latter's charter has been decreed by the court to be in full force. This company has in view the improvement of the valuable water power privilege of the Messalonskee stream. Its purpose is to furnish gas and electricity to Waterville for heating, lighting and power.

COMPANY MATTERS.

New Britain, Conn.—The Otis & McKirdy Co. has been organized in this city to manufacture electric specialties and novelties.

Pittsburg, Pa.—It is reported that the Westinghouse Electric & Manufacturing Company has been asked to bid on a contract for establishing a general electric-lighting and power plant in Valparaiso, Chili. The contract would require about \$150,000 worth of material.

Richmond, Va.—The bill to incorporate the Washington & Fairfax Railroad Company has passed the Senate. The bill to authorize the town of Farmville to grant a franchise to street railway companies has passed the House.

Toronto, Can.—The Toronto Electric Motor Company have notified the Mayor that they have amalgamated with the Thomson Electric Company of Hamilton, and that the Hamilton factory of the latter will be moved to Toronto by the first of May.

FIRES, ETC.

Corbin, Ky.—The local electric light plant was totally destroyed by fire on the 4th inst. Mr. Hamilton, the general manager, says it will be rebuilt at once.

Independence, Mo.—The depot of the Kansas City & Independence Electric Line in this city has been burned to the ground. Loss about \$20,000. The road is operated by the Metropolitan Street Railway Company of Kansas City, Mo.

Lakeview, Ore.—The recent fire that destroyed the residence of J. A. Anthony on Cottonwood creek, about eight miles from here, also destroyed the electric light plant that furnished lights for Lakeview.

Pittsburg, Pa.—The large switchboard in the Westinghouse Electric Works at Brinton was burned a few days ago by carrying too heavy a current and the automatic circuit breakers refusing to work.

PERSONAL AND MISCELLANEA.

Frank B. Flynn has been appointed chief engineer of municipal lighting plants in Chicago. He had been connected with the Chicago Fire Department fourteen years.

The Milwaukee "Wisconsin" says: "The Port Huron (Mich.) Electric Railway is experimenting with a new ball-bearing truck on one of its motor cars, the product of the inventive genius of John Deloyia of this city. This is the first attempt of the ball-bearing principle being applied to electric street cars for the purpose of reducing resistance to a minimum. Railway managers throughout the country are watching the experiment with interest. A ball-bearing trolley has also been perfected and is being given a trial on the Port Huron Electric Railway."

James A. Stratton, secretary and treasurer of the Birmingham Railway & Electric Company, died recently at Birmingham, Ala. Mr. Stratton was born in Aurora, Ind., and was for some time cashier in a bank in that city. He went to Birmingham several years ago and became bookkeeper in a large establishment there. He was one of the organizers of the Birmingham Railway

& Electric Company, and as its secretary and treasurer contributed much to its success. He was unmarried.

The Philadelphia city councils' electrical committee has reported favorably upon the ordinance granting permission to the Time & Weather Service Company to erect and maintain meteorological and time columns at the corners of certain streets in that city. The columns will be constructed of metal of ornamental design, and will be of a width not exceeding two feet six inches and of a height not exceeding ten feet six inches, and the weather vane and time ball supported on the top will be of a height not exceeding six feet nine inches. In the four corners of the structure space will be reserved for barometers and thermometers, which will be first tested for accuracy by the United States Weather Bureau. Telegraphic instruments will be placed in a space 18 x 7 inches for the official forecast, which will be forwarded from Washington at 9 A.M. The company expect to make the columns remunerative by advertising panels placed neatly in the structure.

The Civil Service Commission announces that on April 5 an examination will be held in Washington, D. C., for the position of telephone linemen in the United States life saving service at a salary of \$85 a month. The examination will consist of a light educational test, together with practical questions; and, in addition thereto, applicants will be graded upon their experience and character as workmen. The general qualifications of a telephone lineman should be as follows: He should be able to read and write, should have a fair knowledge of simple arithmetic, should be able to prepare estimates for material and bills for same, to select and lay out routes for telephone lines, to construct and repair telephone lines, to lay and repair submarine cables, to put up telephone and other instruments used on telephone lines and to establish connections; to make ordinary repairs to telephones and instruments and to test lines, cables and instruments; to locate trouble on lines and in cables. He should be familiar with telephone material, and with the mechanism of telephones, call bells and other telephone instruments and apparatus. He should be able to do all work usually required of a telephone lineman, and should be possessed of such information as will enable him to intelligently and satisfactorily perform the duties of the position. He should have had at least five years' experience as a telephone lineman immediately preceding his application; and he would be required to state when and where such experience was had. He must not be under twenty five years nor over forty years of age. He must be physically strong, and of good health, active and able to stand the exposure incident to his employment on the coast.

RECENT COMPANY ELECTIONS.

Canton-Massillon Electric Railway Company, Canton, O.—President and treasurer, W. A. Lynch; vice-president, C. A. Gates; secretary A. J. Underhill; general manager, H. C. Fogle; directors: the officers and J. W. McClymonds, C. M. Russell and R. A. Miller.

Hestonville, Mantua & Fairmount Park Passenger Railroad Company, Philadelphia.—President, John B. Parsons, general manager of the Union Traction Company, to succeed Isaac Blum; secretary and treasurer, D. C. Golden, to succeed Mr. Benson. Mr. Blum was elected a director, taking the place of Lewis A. Riley who retired.

Mount Mansfield Electric Railroad Company, Stowe, Vt.—President, A. H. Soudan; vice-president, P. D. Pike; manager, C. J. Shepard; clerk, L. C. Moody; treasurer, F. O. Burt; directors: A. H. Soudan, C. J. Shepard, G. E. Moody, C. L. McMahon, P. D. Pike and A. H. Bartlett.

Pine Bluff Light & Water Company, Pine Bluff, Ark.—President, Frank G. Bridges; vice-president and treasurer, C. H. Triplett; directors: R. M. Knox, F. G. Bridges, M. H. Johnson and C. H. Triplett.

Port Carbon Electric Light Company, Pottsville, Pa.—President, G. W. Heebner; treasurer, Robert Allison; secretary, F. A. Allison; manager, William Brenner.

West Newton Northern Railway Company, West Newton, Pa.—Directors: W. W. Patterson, Homestead, president; J. O. Tosh, Pittsburgh; F. M. Null, Dawson; G. M. Suter, Sutterville; Dr. J. N. Weddell and T. F. Van Kirk, West Newton. The proposed line is a trolley, to extend from Bellevernon on the Monongahela to Irwin on the Pennsylvania Railroad.

COMMERCIAL PARAGRAPHS.

Electric car heaters are coming more and more into general use. The H. W. Johns Manufacturing Company, 100 William street, New York, have recently brought out a heater of this nature that embodies all the requirements. It is simple in construction, durable, efficient, and above all extremely economical. These heaters are under thorough control and may be so regulated by means of a knife-blade regulating switch located at one end of a trolley car as to enable three degrees of temperature to be obtained. This well-known concern not only manufactures electric car heaters, but trolley line insulating materials, vulcanized controller parts, commutator rings and various other high grade apparatus. Any one contemplating purchasing apparatus of the above nature would do well to write the H. W. Johns Co. for their illustrated catalogue and pamphlet describing their products. Considering the excellent quality of their wares their prices are extremely reasonable.

The Eureka Tempered Copper Company, whose advertisement appears in this issue of ELECTRICITY, has recently moved from 511 and 513 West 18th street into more comfortable and spacious quarters at 107 Liberty street, New

York. We understand that this well-known firm has just closed an important contract for twelve months with one of the largest manufacturers of electrical machinery in the country, and besides has several other important contracts on hand. The large amount of work this company has at the present time speaks well for the quality of its product. The Eureka Tempered Copper Company while making no claims to having discovered the lost art of treating copper, have however been enabled by its process to not only cast pure copper solid without alloys, but also to temper or harden it sufficiently for all mechanical uses without in any way destroying the fibrous qualities of the native metal. The company makes a specialty of the manufacture of commutator segments, both cast and drop forged, dynamo brushes, trolley wheels, bearings, springs and wire, besides copper and brass castings of every description, and carrying in stock at all times a large amount of standard goods, both finished and unfinished, it is always prepared to ship all orders at short notice.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

A Different Company Altogether.

It seems that some company which has a name similar to ours has been unfortunate enough to pass into the hands of a receiver. We, of course, sympathize with our namesake, but desire to inform the trade that while we have troubles this is not one of them, and that we are still selling anti-trust lamps in large quantities.

THE WARREN ELECTRIC & SPECIALTY CO.,
Warren, O.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address: Sterling Remedy Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

The Electric Appliance Company of Chicago are anxious to emphasize the fact that they are agents for a commercially successful electric soldering iron. They state that they have now been handling the irons of the American Electrical Heater Co. for about two years, and that in not a single case have they been unable to secure satisfactory results. They are willing to show their confidence in these goods by guaranteeing every iron they send out to do its work in an entirely satisfactory manner.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

INCORPORATIONS.

The Citizens' Electric Light & Power Company, Gonzales, Tex.—to supply electric light, heat and power to the public. Capital stock, \$5,000. Incorporators: A. Kleine, Jr., W. B. Houston, Charles Berringer, L. C. Brunner and J. D. Sayers, Jr.

The Hayden Electric & Mining Company, Colorado Springs, Col.—to operate in El Paso and Fremont counties. Capital stock, \$250,000. Incorporators: A. B. Heath, E. J. Eaton and E. F. Wright.

The Warwick Valley Light & Power Company—to operate in the towns of Warwick and Chester, N. Y. Capital stock, \$25,000. Directors: George Whitman, Morris, Frank Barber and Helen Barber, Liberty, N. Y.

The Hempfield Electric Light, Heat & Power Company, Jeannette, Pa. Capital stock, \$10,000.

The Rock Hill Water, Light & Power Company, Rock Hill, S. C. Capital stock, \$50,000. Incorporators: A. R. Smith, David Hutchinson, R. T. Fervell and James M. Cherry.

The Port Jervis Light & Power Company, Port Jervis, N. Y. Capital stock, \$50,000. Directors: William P. Richardson, C. J. Field, George A. Elston and C. J. Van Inwagen.

The Cumberland Street Railway Company, Woonsocket, R. I.—to build and operate a street railway from Cumberland Hill to Lonsdale. Capital stock, not to exceed \$100,000. Incorporators: Andrew J. Currier, William H. Tobey, P. J. Gaskin, C. H. Wood, C. F. Wood, A. B. Chase, Charles Dexter, John F. Clark, Cyrus Taft, W. H. Bolster, John Barnes and John Ryan.

The Kentucky Electric Company, Ludlow, Ky.—to furnish electric street lighting for Ludlow. Capital stock, \$30,000. Incorporators: John Devere and Luke Lilly of Cincinnati, J. H. Gueme of Ludlow. The company has al-

ready secured the contract to furnish electric street lighting for Ludlow.

The People's Light & Power Company, Crestline, O.—to furnish light and power. Capital stock, \$30,000. Incorporators: Roy C. Foster, William B. Bolton, A. E. Barridge, J. Chinnock and W. H. Pelton.

The Eastwood & East Syracuse Railroad Company, Syracuse, N. Y.—to operate an electrical road in the villages of Onondaga County mentioned in its title. Capital stock, \$200,000. Directors: A. J. Helden, J. A. Secley, C. M. Warner, G. E. Warner, Edward Joy, A. P. Fowler, F. J. Webb, M. P. Pierce and C. S. Carroll, of Syracuse.

The Electrical Engineer Institute of Correspondence Instruction, Jersey City, N. J. Capital stock, \$50,000. Incorporators: Herman A. Strauss, Joseph Weitzler and Thomas O. Martin, New York, and Edward Ruth, town of Union, N. J.

The Otis & McKirdy Company, New Britain Conn.—to carry on the manufacture of electric specialties. Capital stock, \$10,000, of which \$2,000 has been paid in. Incorporators: Charles H. McKirdy, Fannie W. McKirdy and Charles H. Otis.

The Binghamton Electrical Construction Company, Binghamton, N. Y. Capital stock, \$5,000. Directors: Charles F. Terhune, L. M. Blanding and R. E. Prince, Binghamton.

The Trenton Light & Power Company, Trenton, Ill.—to operate a light, heat and power plant. Capital stock, \$8,000. Incorporators: J. C. Eisenmayer, Louis Retman and Frank Leonhard.

The Winstboro Electric Light & Power Company, Winstboro, S. C.—to put in an electric light plant for 750 incandescent lamps. Capital stock, \$3,000.

The Charleston Light & Water Company, Charleston, S. C. Capital stock, \$50,000, with privilege of increasing to \$3,000,000. Incorporators: Samuel Lapham, Charles R. Volk, W. H. Welch, A. G. Rhett, H. F. Bremer, George I. Cunningham and others.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 8, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 600,134. Electric Locomotive. Harry Bitner, Chicago, Ill. Filed June 19, 1896.
- 600,212. Trolley-Wire System. William J. Kauffman, Elias W. Conkell and Orrin F. Kauffman, Canton, O. Filed June 5, 1897.
- 600,232. Means for Arresting Motion of Electric Cars. Wilbur C. Anderson, West Hoboken, N. J. Filed Aug. 30, 1895. Renewed Oct. 23, 1897.
- 600,278. Automatic Switch for Railways. Howard F. Eaton, Quincy, Mass. Filed July 13, 1896.
- 600,341. Electric Railway. Louise Scherpe, St. Louis, Mo., administratrix of John F. Scherpe, deceased. Filed Aug. 12, 1897.
- 600,183. Automatic Car Fender. Oliver E. Stahl, Baltimore, Md. Filed Oct. 29, 1897.
- 600,224. Safety-Fender for Street-Cars. William B. Heywood, Guadalupe, Cal. Filed Sept. 17, 1897.
- 600,378. Car-Fender and Brake. Emery E. Rice, Charlerol, Pa. Filed April 1, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 600,277. Electric-Arc Lamp. James H. Duncan, San Francisco, Cal., assignor to Robert Bruce Elder, same place. Filed July 13, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 600,135. Electrical Surgical Engine. Arthur W. Browne, Prince's Bay, N. Y., assignor to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Oct. 19, 1897.
- 600,228. Polyphase-Current Transformer. Carl Kurda, Nuremberg, Germany, assignor to the Elektrizitäts Actien-gesellschaft, vormals Schueckert & Co., same place. Filed Nov. 5, 1896.
- 600,336. Automatic Regulator for Electric Currents. Joseph D. C. Chateau, Paris, France. Filed July 10, 1897.
- 600,446. Multiple Energizer Momentum-Engine. Benjamin C. Poie, Camden, N. J. Filed May 2, 1887.

ELECTRIC HEATERS, ETC.

- 600,285. Electric Heater. Richard J. Holland, New York City. Filed Dec. 24, 1896.
- 600,417. Electric Heater. Edward E. Gold, New York City. Filed Aug. 12, 1897.

SIGNALS AND SIGNALING APPARATUS.

- 600,384. Signaling Apparatus. Vibe K. Spicer, Kenilworth, Ill., assignor to the Union Switch & Signal Company, Swissvale, Pa. Filed April 27, 1897.
- 600,385. Signaling Apparatus. Vibe K. Spicer, Kenilworth, Ill., assignor to the Union Switch & Signal Company, Swissvale, Pa. Filed July 13, 1897.

MISCELLANEOUS.

- 600,230. Electrotherapeutic Exercising Apparatus. Abraham Martin, Paris, France. Filed Nov. 23, 1897.
- 600,265. Electrical Measuring Instrument. Adrian H. Hoyt, Penacook, N. H. Filed July 2, 1897.
- 600,290. Therapeutic Electrode. John S. Muir, San Francisco, Cal. Filed Aug. 24, 1897.
- 600,346. Insulating-Connector. Herbert E. Pearce, Brooklyn, N. Y., assignor to Fannie Pearce, same place. Filed May 18, 1897.
- 600,380. Galvanic Apparatus. George H. A. Schaefer, Buffalo, N. Y. Filed Jan. 7, 1898.
- 600,383. Electrically-Operated Brush. Alfred Sherwood, Topeka, Kan. Filed March 1, 1897.
- 600,397. Arm for Telegraph-Poles. Lee Anderson, Paris, Tex., assignor of one-half to Wallace B. Howard and Alex. Staggs, same place. Filed April 20, 1897.
- 600,457. Electrical Battery. Nathan B. Stubblefield, Murray, Ky., assignor of one-half to William G. Love, same place. Filed Oct. 24, 1896.
- 600,475. Electrical Insulator and Method of Making Same. John W. Boch, East Liverpool, O. Filed Oct. 23, 1897.

DESIGN.

- 28,355. Insulator. Louis McCarthy, Boston, Mass. Filed Jan. 18, 1898.

Help to Fight the Electrical Trust by subscribing for **ELECTRICITY**.

TELEPHONE AND TELEGRAPH.

Gen. Greely, the Chief Signal Officer, has written a letter to the Secretary of War, calling his attention to the omission from the Sundry Civil bill as reported to the House of the estimate of \$20,000 for cables to connect electrically the fortifications in the harbors of New York, Boston and Philadelphia. In his letter he says: "For seven consecutive years the Chief Signal Officer has unavailingly recommended the importance of this matter, reciting the fact that some of our most important defences can only be reached by messenger. The destruction of the military cables between Alcatraz, Angel Islands and the mainland long since left the fortifications in San Francisco harbor isolated and entirely unconnected electrically, and Fort Warren, in Boston harbor, is also without reach by telephone or telegraph. In New York harbor it is true that several posts can communicate with each other over circuitous commercial routes, but such complicated methods, inadequate in peace even, would inevitably break down in case of actual hostilities."

The consolidation of the Cumberland Telephone & Telegraph Company and the Great Southern Telephone & Telegraph Company has been ratified by the stockholders of both companies. The officers of the consolidated concern are: James E. Caldwell, president and general manager; William Litterer, vice-president; Leland Hume, secretary and assistant general manager; Col. A. W. Crandall, superintendent; T. D. Webb, treasurer. Executive Committee: W. W. Berry, William Litterer, A. G. Sharpe, V. E. Shwab and James E. Caldwell. Board of directors: James E. Caldwell, Nashville; Col. A. G. Sharpe, Atlanta; V. E. Shwab, Nashville; M. J. Smith, Nashville; R. M. Barton, Chicago; William Litterer, Nashville; W. W. Berry, Nashville; Henry Sperry, Nashville; George G. Hall, Cincinnati; F. W. Cook, Evansville; George R. Knox, Nashville; W. H. Woolverton, New York.

A bill of sale given by the New York State Telephone Company to the Automatic Telephone Service Company of Buffalo, for a consideration of \$1, has been filed at the county clerk's office in Utica, N. Y. It transfers 845 shares of stock of the Utica Telephone Company, 30 shares of stock of the Oneida Telephone Company, 336 contracts with subscribers for service in Utica, 600 contracts with subscribers in Johnstown and Gloversville, contracts with subscribers in Rome and elsewhere, merchandise, supplies, etc., in Rome and Utica, and other assets and property belonging to the New York State Telephone Company, as collateral and continuing security for royalties due and to become due to the Automatic Telephone Service Company of Buffalo.

At the annual meeting of the Hudson River Telephone Company the following officers were elected: President, Selden E. Marvin; vice-president, James H. Manning; secretary and auditor, Walter B. Butler; treasurer, James J. Fitzsimmons; general manager, Henry E. Hawley. The gross receipts for the year were \$221,121.34, and the net revenue was \$13,917.22. Ten exchanges were opened. General Manager Hawley reported that 38 exchanges are operated by the company, and that the aggregate number of subscribers is 6,488, an increase of 1,031 for the year.

A telephone company has been organized at Eureka, S. D., with the following officers: President, William Robb; vice-president, E. G. Kennedy; secretary, C. N. Herriet; treasurer, Walter Poehler; general manager, J. W. Gabin. Work will begin in a short time. It is confidently expected that the Dakota Central Telephone Company will extend its limits to Eureka the coming season, thus connecting Ipswich, Bowdle, Rescue, Eureka, Leala and other towns with Aberdeen, S. D.

The officials of the New York Board of Trade say they are determined to secure some relief from the present telephone monopoly. If their efforts fail at this session of the Legislature, a different kind of campaign will be begun, with Vice-President R. M. Walters and Committee-man Rupert A. Ryley in charge. A number of merchants and manufacturers will combine with the officers of the municipal government and start a new telephone company in rivalry with the present monopoly.

Assemblyman Wicke has introduced a bill in the New York Legislature providing that within one year all telegraph, telephone, and electric light wires in New York and Buffalo shall be placed underground at the expense of the corporations operating them under the direction of the Commissioner of Highways or Board of Public Works.

A number of citizens met recently at the Opera House in Humboldt, Neb., and took steps toward organizing a company to put in and operate a local telephone exchange. It was decided to issue stock to the extent of eighty shares of \$50 each, to raise money for putting in the system.

At the annual meeting of the Commercial Cable Company, New York, the following officers were elected:

President, J. W. Mackay; vice-president and general manager, G. G. Ward; vice-presidents, C. R. Hosmer, A. B. Chandler and C. H. Mackay; treasurer, E. C. Platt; secretary, Albert Beck; assistant secretary, J. O. Stevens.

The act for the taxation of telegraph, telephone and express companies in the State of South Carolina, passed at the recent session of the Legislature, makes it obligatory upon these companies to furnish to the Comptroller General of the State a sworn annual statement of their capital, property of all kinds, mortgages, transactions, equipment, operation, etc.

The District of Columbia Appropriation bill was passed by the Senate on the 8th inst. The bill limits the charge for telephones in the District to \$50 a year on a separate wire, \$40 when there are not more than two on a wire, \$30 when not more than three on a wire and \$25 when there are four or more on the same wire.

A bill has been introduced in Congress for the erection and operation of a postal telephone system in Washington to be under the control of the Postmaster General. The sum of \$100,000 is asked for this purpose, which would be the means of connecting all the public buildings and Government offices in the city.

The Boston Post states that more than 4,000 telephone subscribers in the Boston district alone have signed the petition to the Legislature for the enactment of the Post telephone bill for a reduction in rates. Boston is the home of the Bell monopoly and it has organized a strong opposition to the bill.

The Automatic Telephone Company of Amsterdam, N. Y., is about to make a reduction in its rental charges. Hereafter telephones in business places will be \$2.50 a month instead of \$3, and residence telephones \$1.50 instead of \$2 as heretofore.

The Bell Telephone Company has cut rates in the Saginaw Valley to \$12 per year for residence 'phones. The Valley Company will probably meet this price as soon as it begins operations.

The city council of Owosso, Mich., refused to accept the offer of six free telephones for three years from the Bell company.

The Farmers' & Merchants' Telephone Company's lines between Quincy, Barry and Pittsfield, Ill., were thrown open to the public on the 8th inst.

F. A. Smart of the State Telephone Company has secured orders for nearly 100 'phones at Lapeer, Mich. The line will be built in May.

The council of St. Paul, Minn., has passed the Minnesota Central Telephone Company's long distance franchise.

New Companies Incorporated.

The Monroe Telephone Company, Woodfield, O. Capital stock, \$1,000.

The Western Telephone Manufacturing Company, Chicago, Ill. Capital stock, \$2,000. Incorporators: M. B. Kennedy, W. A. Bisland and S. C. Platt.

The Versailles Telephone Company, Versailles, Ky.—to establish a telephone system. Capital stock, \$5,000. President, B. B. Smith; vice-president, Charles S. Powell; secretary-treasurer, W. R. Proctor.

The Wilson Spring & Telephone Company, Wilson, W. Va. Capital stock, \$100,000. Incorporators: Joseph T. Stubbs, Vernon M. Pierce, Prentice H. Manning, Joseph Hinckley and George G. Hackett.

The Bucyrus Telephone Company, Bucyrus, O. Capital stock, \$30,000.

The Mississippi Valley Telephone Company of Minneapolis, Minn. Capital stock, \$1,000,000.

The Hays City Telephone Company, Hays City, Kan. Directors: I. M. Yost, C. M. Warren, J. H. Ward, E. D. Yost and Otto Swaller.

The Phoenix Telephone Company, Phoenix, N. Y.—to operate in Phoenix and Fulton and adjoining towns. Capital stock, \$10,000. Directors: C. F. Loomis, F. K. Avery and A. D. Merry, Phoenix; Joseph K. Whitaker and Lenox Smith, New York City; E. E. Summey, Syracuse; C. H. Brace, Baldwinville.

The Crookston Telephone Company, Crookston, Minn.—to connect Crookston, East Grand Forks, Red Lake Falls and other towns by telephone. Capital stock, \$10,000.

The Iowa & Nebraska Telephone Company has filed articles of incorporation at Lincoln, Neb. Capital stock, \$50,000. President and secretary, W. W. Pritchett; treasurer, B. B. Van Stunberg.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

Late quotations for copper are: Electrolytic, 11½c.; Lake, 11½@12c.; cast, 11.65c.

The Citizens' Passenger Railway Company of Philadelphia has declared a dividend of \$3.25 a share.

The Citizens' Electric Light & Power Company of St. Louis has increased its capital stock from \$750,000 to \$2,000,000.

The stockholders of the Allegheny County Light Company, Pittsburg, Pa., have voted to increase the capital stock from \$1,500,000 to \$2,500,000.

The directors of the Ridge Avenue Passenger Railway Company, Philadelphia, have declared a dividend of \$3 per share on the stock.

The Edison Electric Illuminating Company of Brooklyn reports for February: Gross, \$75,601; increase, \$5,783; net, \$38,625; increase, \$4,622.

The Western Union Telegraph Company has declared the regular quarterly dividend of 1½ per cent., payable April 15. Transfer books close March 18 and reopen April 1.

The United Traction & Electric Company of New Jersey has declared a dividend of 1 of 1 per cent. on its capital stock, payable April 1. Books close March 21 and reopen April 3.

The Holbert bill in the New York Legislature, authorizing cities of the third class to make five year contracts for lighting the streets, was called up in the Assembly and amended so as to apply only to cities of 4,000 or less.

The New York State Railroad Commission has granted the application of the Van Brunt Street and Erie Basin Railroad Company of Brooklyn to change its motive power from horses to the overhead electrical trolley system.

The Government has placed an order with the Electric Storage Battery Company, Philadelphia, for a number of storage batteries to be used for lighting fortifications along the coast. Negotiations are also pending for batteries for submarine boats.

A meeting of the minority stockholders of the Wilmington City Electric Railway Company was held at Wilmington, Del., on the 11th inst., when the proposition to sell their stock to the Clark syndicate at \$13 a share, payable in 5 per cent. gold bonds, was accepted. Most of the stock has already been deposited.

A bill now before the New York Legislature provides that the Railroad Commissioners shall within six months designate a suitable fender for trolley and cable cars, and that by January 1, 1899, such fenders shall be applied to all cable and electric cars used in cities of 60,000 inhabitants or more.

The Kings County Electric Company, whose plant is being erected in Gold street, Brooklyn, N. Y., is said to have already secured contracts to furnish almost its entire voltage of more than 20,000 horse-power. The directors of the company, it is asserted, are considering the advisability of buying more ground and extending the plant at an early day.

For the purpose of forcing the State Legislature of Michigan to consider the question of the local taxation of property of railroad, telephone and telegraph companies in accordance with the bill already prepared, Governor Pingree has issued a call convening the Legislature in special session Tuesday, March 22.

The Stock List Committee of the New York Stock Exchange has been empowered to add to the list from time to time the \$1,262,000 new stock of the Edison Electric Illuminating Company of New York as notice shall be received that the same has been issued, making the total amount listed \$9,200,000.

An anti trust bill introduced in the Ohio Legislature fines corporations and firms from \$50 to \$5,000 and imprisonment from six months to one year for restricting commerce, reducing production, preventing competition or fixing price of commodity or transportation. Forfeiture of franchise is also provided.

The purchase of the gas and electric light companies at Herkimer, Ilion and Little Falls by a syndicate of New York capitalists is to be followed by a consolidation of the three companies into one corporation. The capital of the consolidated company will be \$400,000 and the name The Central New York Light & Power Company.

The decision of the Supreme Court of the United States in the Nebraska maximum freight case establishes the doctrine that the courts will not permit the Legislature of a State to regulate the railroad rates to such an extent as to deprive railroad companies of reasonable compensation for their services based upon the fair value of the property which they use for the benefit of the public.

The Appellate Division of the Supreme Court has denied a motion on behalf of the New York Rapid Transit Commissioners for a reargument of the rapid transit question upon the point as to the bond to be required, but the Court in effect sustained the contention of the Rapid Transit Commissioners that the greater part of the security demanded should be conditioned only upon the construction of the road and should not cover equipment and payment of rentals. It is provided in the opinion that the \$15,000,000 bond shall be divided, \$14,000,000 to apply to construction only and \$1,000,000 to be a continuing guarantee applying to equipment and operation.

At the annual meeting of the Consolidated Traction Company of New Jersey, on March 28, the stockholders will vote on a proposal to lease the property of the company to a new corporation, known as the North Jersey Traction Company, that will be organized. The new company will take in not only the Consolidated Traction Company, but also one or perhaps two independent lines now operating in Orange and perhaps also the Paterson Street Railway. The amount of capital stock has not yet been fixed nor have the terms for issuing it been finally determined. The North Jersey Traction Company will guarantee annual dividends on the Consolidated Traction Company stock, beginning with 2 per cent., and increasing gradually until at the end of eight years the rate will be 4 per cent., which will be the amount paid for the balance of the lease. The plan will undoubtedly go through, as the projectors own more than a majority of the Consolidated stock, and will have a controlling interest in the North Jersey Traction Company.

The Appellate Division of the Supreme Court sustained the action of the lower court in granting to Patrick H. Flynn an injunction restraining the Coney Island & Brooklyn Railroad Company from making a mortgage, the total authorized amount of which, for present and future use, would, it is alleged, be in excess of two-thirds the present value of the road. The proposed amount of the mortgage was \$1,500,000, but of this sum \$500,000 was not to be issued at present, being reserved for future requirements; but the Court holds that under the law the total authorized issue of bonds, as well as the actual issue, must not exceed the company's capital stock nor two-thirds the present value of the property.

The Union Light & Power Company of Salt Lake City, Utah, has filed in the office of the county recorder a mortgage for \$750,000 in favor of the Central Trust Company of New York, to secure an issue of 750 bonds of the denomination of \$1,000 each. Under the terms of the mortgage, the company conveys to the trustee all of the property and franchises of the Salt Lake and Ogden Gas & Electric Light Company, the Big Cottonwood Company, and Citizens' Little Cottonwood and Pioneer companies, subject to certain indebtedness specified in detail. The bonds secured by this trust deed bear 5 per cent. interest payable semi-annually and are redeemable at 105 on any interest day after November 1, 1907, both interest and principal payable in gold coin of the present weight and fineness of United States coin. Default in interest for six months is stipulated as cause for foreclosure under the trust.

EDITORIAL NOTES.

Electricity on Shipboard.

Strange as it may seem, electricity has but comparatively recently been adopted to any great extent on shipboard. This has probably been due to the fact that the various manufacturers of electrical apparatus were devoting their energies to perfecting electrical machinery for shore use, and gave little attention to bringing out special designs suitable for the use of ships, where space is limited and unusual conditions exist.

Electricity was however made use of for illuminating purposes on vessels at a comparatively early date, probably the first installation of this nature being that on the steamer Columbia of the Oregon Railway & Navigation Company, some eighteen years ago. These early plants were necessarily more or less crude, the armatures of the dynamos being driven by belts from engine pulleys. As will readily be seen, this method was by no means economical of space and was therefore adopted but slowly. The direct coupled generating plant was the solution of this problem owing to its compactness, and has now been generally adopted by almost all classes of vessels. When the electric current first came into use on shipboard it was feared that a ship's compass would be affected through magnetic leakage from the dynamos, but this danger has been averted by using only generators with closed magnetic fields and arranging the conductors concentrically in the neighborhood of a compass.

At the present day the electric current is slowly but surely superseding compressed air and steam as a motive power for various purposes, especially on vessels of the United States Navy. Electric power is generated on men-of-war not only for lighting purposes but for controlling searchlights, operating small ventilating fans and for signaling at night. Of the latter there are several systems, but probably the most successful consists in suspending in a vertical line from the rigging four double lanterns spaced at short intervals apart, each containing two 50 candle-power incandescent lamps. Each of the double lanterns is fitted with two lenses, the upper one showing red, the lower white. These eight lamps in the four lanterns of two colors each allow of thirty different combinations being made, each combination corresponding to a given letter of the alphabet or sign. The electric lamps are separately connected, all the conductors leading to a common keyboard conveniently located. By properly manipulating the keys any lamp or combination of lamps may be simultaneously lighted or extinguished.

This is however but one of the uses to which electricity is applied. What is known as the running or side lights of a vessel are now also lit by means of the electric current. With a view to reducing to a

minimum the chance of a running light's becoming extinguished (a very serious matter), each lantern contains two incandescent lamps separately connected. In the event of a break occurring in one of the circuits a specially devised indicator records the fact.

Another ingenious use to which electricity has been put in men-of-war is a device arranged to sound an alarm when the temperature at the point where the device is located reaches a certain number of degrees. This arrangement, which is simplicity itself, consists of a small glass tube having a wire in each end, and partially filled with mercury. The device is placed in a vertical position in circuit with a battery and bell, the latter ringing when the mercury by expanding comes in contact with the upper wire, thereby closing the circuit.

Heat alarms of the above description have been used quite extensively in vessels of the United States Navy as a precautionary measure against fire due to spontaneous combustion in coal bunkers. On a large number of fighting ships electric motors are used to operate the valve of the steam steering engine, and in the case of a German man-of-war recently constructed, the steam steering apparatus has been done away with entirely, an electric motor having been substituted. Again, for fog signaling, the whistle is in many instances blown automatically at regular intervals by means of a motor operated by electricity. In quite a large number of vessels electric power has superseded compressed air in the operation of ammunition hoists, and in one or two recent cases the lighter gun turrets have been operated by electric motors. As an instance, two of the turrets on the cruiser Brooklyn are now revolved in this manner—the electric current having proven extremely well adapted for such usage—and are stated to have given entire satisfaction. In some of the vessels which are being constructed a further extension of electric transmission of power is now being made to include the large turrets and all the gun-mount movements of the large guns.

By no means the most unimportant use however to which electricity is put at the present time on most of our men-of-war is in operating what is known as the Fiske range-finder. This ingenious device, which has frequently been described, enables the distance of an enemy's ship to be exactly determined by means of two telescopes electrically connected, through a well-known trigonometrical principle. Knowing the length of the base line and ascertaining the number of degrees in the two angles at the base of the triangle, the length of one of the other sides is automatically registered on a dial.

There would seem to be among marine engineers a fear that electrolytic action might be set up between the hull of a steel vessel and the salt water. It has been claimed that vessels equipped with electrical plants have developed rapid deterioration in

all sea-water pipe connections. Whether this has been due to electrolytic action or some other cause has not yet been fully determined, little reliable data on this subject having up to the present been collected. It would seem however very questionable whether any great deterioration could take place through this cause, owing to the hull of a modern steel vessel offering so slight a resistance to the passage of any stray currents and to the fact that a large body of salt water is a comparatively good conductor.

* * *

Another Vacuum Tube Light.

In an editorial which appeared in *ELECTRICITY* a short time ago we described at some length a method of vacuum tube lighting invented by Mr. D. Macfarlane Moore of Newark, N. J. We now hear of another invention in this line which it is claimed will revolutionize our present method of lighting. If we are to believe one of the sensational dailies, Mr. John H. J. Haines, the originator of this new system, has succeeded in obtaining a light differing little from that which the firefly emits. In other words, he has apparently discovered what such men as Edison, Tesla, Crookes and other scientists have been seeking for years—light without heat.

Mr. Haines has been experimenting on this new light since 1890. The basic principle on which he has worked is the vacuum tube, but his results were obtained, so it is said, along lines differing radically from those followed by other experimenters. His chief aim has apparently been, not only to procure a cold light, resembling daylight in its whiteness, but to procure a vacuum tube light that would be economical in operation.

The system Mr. Haines has devised is somewhat novel. His vacuum tubes contain a highly rarefied gas. The efficient production of light from the tubes depends upon the great frequency of well-blended electrical oscillations. The system is said to be extremely simple, no elaborate generators being required. His apparatus may be attached to an ordinary alternating current electric lighting circuit. By means of two step-up transformers the voltage of the ordinary commercial circuit is greatly increased until in the neighborhood of 1,000,000 volts are obtained. The vacuum tubes are some five feet in length and two and a half inches in diameter, presumably of the ordinary type, capped with tinfoil electrodes. The light given forth is extremely white and diffuses itself evenly throughout a room, enabling a photograph to be taken, so Mr. Haines claims, in the short space of fifteen seconds.

With the large number of new illuminants that have recently made their appearance some ought certainly to prove a success. No sooner does an alleged new illuminant make its appearance, however, than a company is formed to exploit it, and that very frequently is the last heard of it. In the case of the Haines vacuum tube light, as usual, a company is said to be organizing with a capital of \$10,000,000 for the development of the invention.

* * *

Long Distance Submarine Telephoning.

There is said to be a scheme on foot among a number of capitalists and several cable and telephone companies toward establishing a transatlantic telephone cable line. If such is the case the matter is being kept exceedingly quiet, no information of any kind being allowed to leak out. It might, however, be interesting to learn how the promoters of this enterprise propose to overcome seemingly insurmountable difficulties—and justly looked upon as such, all previous attempts in this line having proven dismal failures.

The problem of overcoming static induction has so far been the main stumbling-block. Several methods or schemes have been from time to time suggested as a solution, but have invariably proven inadequate

when fairly tested. There is said to be a submarine telephone cable in commercial operation in South America, twenty-eight miles in length, which gives fairly good results, and there is also a successfully operated submarine telephone cable across the English Channel, twenty-two miles in length. When, however, it is a question of telephoning some 2,500 miles over a cable, which would be the minimum length of a transatlantic cable, at the present state of the art the difficulties would be insurmountable. Through static induction there is a loss, the quick, short sound waves which we ordinarily hear over the telephone would be changed into long, slow vibrations which the human ear would be unable to detect.

At the present time the only known method of overcoming static induction is in increasing the size of the copper conductor and the thickness of the insulating material. In order to overcome static induction in a cable 2,500 miles in length the copper conductor would probably have to be not less than five inches in diameter, which would make the cost of the copper alone something enormous, and would prohibit the undertaking at the very start. It moreover would be practically impossible to lay such a cable, but even assuming that it could be successfully laid, the price that would have to be charged for, say, "five minutes" conversation, would necessarily be so excessive in order to pay a fair interest on the investment that it would prohibit its being used. Prof. Alexander Graham Bell, as reported in the *New York Morning Telegraph*, refers to the matter as follows:

"That the problem has been one of the hardest electricians have ever had to cope with is admirably proven by the fact that so great an enthusiast on the subject of submarine cables as Lord Kelvin, who is, by the way, a very sanguine man, has heretofore considered it as insolvable."

* * *

The Paris Exposition of 1900.

The Paris Exposition of 1900 has for some time past been creating considerable interest. That France will endeavor in every way to make this event a greater success than our Chicago Exhibition is unquestionable, although it is frankly acknowledged that it would be an impossibility to equal the Columbian Exposition as far as beauty of location is concerned. It would probably be difficult to find a more beautiful or suitable spot for holding a universal Exposition than along the shore of Lake Michigan. In this respect Paris is undoubtedly seriously handicapped, it having been decided to hold the Exposition of 1900 on the public grounds extending on both sides of the Seine from the Place de la Concorde to a point beyond the Pont de Jena, comprising the Champs de Mars, the Trocadero Palace, the Esplanade des Invalides, the Quay de la Conference, the Cours de la Reine and a large portion of the Champs Elysées.

The system of admission for exhibitors is to be by double juries—in other words, every precaution is being taken to exclude articles that would be of little interest to the general public.

There will be no large foreign buildings similar to those at Chicago. The exhibits will be placed by subjects, every nation being expected to show its products in the building for all belonging to the same classification. By this arrangement a visitor will be able to examine in regular order the various exhibits of any nation.

There will be in all eighteen groups and 120 classifications. At Chicago there were but twelve groups while on the other hand there were almost one thousand sections. The exhibit of electricity and electrical apparatus will come under Group V, and is expected to play a very important part. Germany is said to be making immense preparations in this line with the hopes of excelling the world. This country will however be exceedingly well represented, and it

is therefore very questionable whether Germany's hopes are not doomed to disappointment.

It is as yet too soon to form any very exact idea of what the exhibits will be, but one of the most unique features already spoken of is an electric organ at the striking of whose notes a tiny ballet dancer will appear in the air dancing to the music, the whole forming a mimic ballet above the organ. Naturally, among other things, all the latest electrical inventions and apparatus will be on exhibition, it being the aim of the committee in charge to make the Exhibition a great success from an educational standpoint.

As a motive power electricity will reign supreme. During the Exposition of 1889 the electric current was freely used for illuminating purposes, the electric fountains especially attracting wide attention. Although electricity was used at that time to a considerable extent, gas was held in reserve, it being feared that an accident might happen to the generating plant. In 1900 it is proposed to make electricity the motive power of the whole Exhibition. M. Picard, the Commissioner General, who is also an able engineer, contemplates, it is said, generating sufficient current for all lighting and motive purposes at the coal mines of Nord and Pas de Calais, which are situated about 100 miles from the French metropolis, delivering the current by means of a high tension transmission circuit to the Exhibition grounds.

It is moreover M. Picard's intention that throughout the various buildings the electrical machinery shall be shown in action where such apparatus is used in the manufacture of a commercial product. Thus, for example, electric motors employed in operating printing presses would have their armatures revolved through the medium of an electric current generated at a point one hundred miles away.

There will be a large number of electric railways constructed, all leading to the grounds, with a view to affording visitors every facility for transportation. There will also undoubtedly be a moving platform operated by electricity, somewhat similar to the one at the Chicago World's Fair. In short, it is intended that electricity shall play the grand rôle at the Universal Exposition of 1900, and many new applications of the current may be looked for.

Under the Searchlight.

Notes and Comments on Various Topics.

Mr. F. P. Fish, general counsel of the General Electric Company, has sailed for Europe on a short business trip.—*News Bureau.*

Can it be possible that the president of the G. E. Company has decided to act upon our suggestion relative to creating a trust in warships, and has dispatched Mr. Fish to make investigations as a preliminary to drawing up the papers? It looks that way. We shall await the outcome of Mr. Fish's trip with considerable interest.

* * *

A CABLE dispatch to the *New York Sun* dated London, March 19, says: "The Marconi wireless telegraph boom seems to have petered out, and the syndicate which kept it going for over a year has arrived at the conclusion that there is no money in it. The fact is, the commercial aspect of this interesting subject led to a fuss long before the improved handling of the old discovery had got beyond the laboratory stage. Big brains are now working upon it, and in due course a practical method of utilizing the discovery will probably be forthcoming. Prof. Oliver Lodge, for instance, says he has an entirely new method of telegraphing without wires which will, he hopes, enable him to send messages long distances. He does not depend upon waves but upon magnetism, which is independent of obstacles; and he believes it will be applicable

to signaling between ships and between the shore and ships. Prof. Lodge's ideas are not for sale to any syndicate."

* * *

SOME extraordinary displays through the agency of electricity may be expected for the Charter Day celebration next May in New York. The committee on decorations has secured, so it is said, for the celebration all the manhole subways in Broadway and Fifth Avenue and in them it is proposed to locate powerful electric searchlights. The holes will be covered with a grid which will cause the rays to shoot upward in elongated lines forming the American flag with the stars uppermost. From the Battery to Central Park will be stretched miles of wire, hung thickly with colored globes, and an alternating current will be shot through them. At equal distances great varicolored globes will be suspended, and powerful lights will play upon them. The committee has adopted as a special Charter Day flag a shield bearing the city's coat-of-arms, circled by five stars, emblematic of the five boroughs. This is also susceptible of clever light effects and will be used in the night displays. It has not yet been definitely decided whether the Brooklyn Bridge will be electrically illuminated or not. In all probability it will be the center of an enormous pyrotechnical display, however.

* * *

THE New York *Journal of Commerce* in a recent issue refers to electrical apparatus manufactured in this country and exported abroad as follows:

London advices to an electrical company indicate that the prices being sent from here, both on electrical apparatus and machinery, compared with those on the other side, on railroad work, are from 6½ to 7½ per cent. cheaper, and they further state that if these prices are maintained, the probabilities are that a considerable amount of work will be ordered on this side. This applies particularly to motors and trolley equipments in general, not necessarily for European roads but for work in which European capital is interested in other parts of the world. The general opinion prevails that with the success American electrical equipment is meeting abroad, a good foreign business may be anticipated throughout the present year.

It is extremely difficult to see how manufacturers of electrical machinery in the United States can afford to sell their goods 6½ to 7½ per cent. cheaper than apparatus turned out on the other side otherwise than at a loss, especially when we recall the fact that the price of labor is about twice as high here as in Europe. It may be, however, that the European manufacturers have not as yet caught on to the trick of turning out stocks and bonds in conjunction with other products.

* * *

THE New York *Morning Telegraph* says:

A prominent investor "who trots in the same class with the well-known gentleman having authority to speak," and the "man high in official circles whose name cannot be used in this connection," so familiar in the rumor monger's vocabulary, came out yesterday with this little boom for General Electric: "During the recent decline the comparatively small number of shares of General Electric which have come on the market indicate how strongly the stock is held." Those who know how much the boom manufacturer of General Electric is overworked will appreciate this desperate attempt to give the stock a boost. The heartrending search by William J. Clark for a press agent for General Electric who could reel off fairy stories at will is still remembered in the Street.

Judging from the large number of attractive and enticing paragraphs that are constantly appearing in various papers on General Electric, Mr. Clark's efforts must have been crowned with success.

* * *

THE *Street Railway Review* gives the following account of a professional contortionist who is in the habit when short of funds of falling and dislocating his hip whenever in his opinion there is an opportunity of collecting damages from a railway company: "Some months ago a man fell on the platform of a passenger station near Indianapolis, having caught his heel in a crack, and the result was a dislocated hip. The company settled for \$2,200 and attorney's fees, and extended courtesies in the way of furnishing transportation for the man and his nurse,

etc. Quite recently a similar accident occurred in Virginia and a claim of damages was presented. The man had been seen the day before hunting about the platform for a hole in which to catch his heel, and a traveler who was present recognized him as the victim of the 'accident' in Indiana. The Virginia road did not settle his claim, and the Indianapolis company want his present address."

* * *

THE following from the San Francisco *Call* should be read by all advocates of municipal ownership:

"It is by no means creditable to the officials of the city that so simple a municipal work as that of street lighting should be a problem impossible of solution. It appears, however, that the task is too hard for the supervisors, and as a consequence we are to have lights shut off for a good many nights in each month from now to the end of the fiscal year.

"There are people who talk of municipal ownership of water works and lighting plants. They fondly believe the supervisors could take hold of the business of those works and operate them with success. To these people the failure of the supervisors to properly manage even so small a thing as street lighting when they have none of the bother of running the plant will doubtless appear as a direct evidence of diabolism. 'The devil is in it,' they will say when they go out some night and find the streets unlighted, and they will add, 'He delights in darkness and has put up this job.'

"The general mass of citizens, however, will not have to lug in the personality of Satan to explain the situation to their understanding. It is but another of the thousand evidences of administrative incompetence that is the bane of American municipalities. If the thing were not of such common occurrence and so similar to the results of equal incompetence in the management of all kinds of municipal work, there would be something almost startling in the fact that a city as rich as San Francisco, having all the appliances of modern science and art at command, cannot keep its streets lighted. As it is, the darkness will simply give occasion to a few more crimes than usual; life and property will be a little less safe; there will be some grumbling and some swearing at the supervisors, and then, with our habitual American toleration of official misconduct, we will let the thing pass and wait for the coming of the new fiscal year."

* * *

A VERDICT of \$9,000 in favor of the plaintiff in a damage suit brought against the Woonsocket Street Railway Company by a wheelman who came into collision with one of the company's cars has prompted the manager of the company to post up the following instructions to motormen on the line. The suggestion of sarcasm in the order will be appreciated by impatient persons who ride in the cars:

"When a motorman sees a bicyclist approaching the car and going in an opposite direction, the motorman shall, when thirty feet from said bicyclist, stop his car and not start it until the bicyclist has passed. If a bicyclist is going in the same direction and ahead of the car, the motorman must keep his car 100 feet in the rear of the bicyclist and not approach nearer."

* * *

SPEAKER REED recently wished to see a political friend on some very important business and telegraphed him to go at once to Washington. The friend took the first train, but a washout on the road soon stopped him. Going to a telegraph office he sent this message: "Washout on the line. Can't come," to which in due time he received the following reply from the Maine statesman: "Buy a new shirt and come any way."

Telephone Lines and Thunderstorms.

The German Postal authorities have recently been examining into the influence exercised by telephone lines on the frequency of thunder claps. Observations were made at 140 places with telephonic com-

munication, and at 560 places without. The results show that while under the latter circumstances an average of five detonations occur during a thunderstorm, yet where telephone lines are present this number is reduced to an average of three, the flash also appearing to be considerably lessened.

NORTHWESTERN ELECTRICAL ASSOCIATION.

The Committee Accepts the Invitation to Visit Duluth and Superior in June.

JANESVILLE, Wis., March 14, 1898.

At a meeting of the committee having in charge the summer meeting of the North-western Electric Light Convention—present Messrs. P. Norcross, chairman, P. H. Korst, Henry L. Doherty and J. M. Hill—the following resolution was put to vote and unanimously carried:

Resolved, That as a Committee of the Northwestern Electrical Association, we accept the invitation of the cities of Duluth and Superior to visit those cities next June.

That Mr. J. M. Hill of Chicago is authorized by this committee to make arrangements with any steamboat company for a summer meeting of said Association, to be held en route from Chicago via Sault Ste. Marie, Hancock and Houghton to Duluth.

American Institute of Electrical Engineers.

The 123d meeting of the Institute will be held at 12 West 31st street this (Wednesday) evening at 8 o'clock.

A paper will be presented by Prof. Reginald A. Fessenden, of Allegheny, Pa., on "Insulation and Conduction."

Applications have been received from the following candidates for associate membership, which will be acted upon by the council at its meeting April 27: N. S. Hopkins, Schenectady, N. Y.; Newton L. Schloss, New York City; Clarence R. Tolman, Silverton, Col.; Frederick A. Muschenheim, New York City; Felix L. Cadou, Washington, Ind.; George J. Henry, Jr., New York City; Robert Lindsay, Cleveland, O.; Ernest S. Vinten, New Haven, Conn.; Wyatt H. Allen, Garwood, N. J.; Wm. H. Fitzhugh, Bay City, Mich.

Members who desire to present papers during the season of 1898 are requested to communicate with Mr. Herbert Laws Webb, 15 Dey street, chairman of the Committee on Papers and Meetings, or with Mr. Ralph W. Pope, the secretary.

A Portable Electric Railway.

A description of a practical form of temporary light railway is described in the *Zeitschrift für Elektrotechnik* and accredited to "Mittheilungen über Gegenstände der Artillerie- und Geniewesen." The rails have the usual profile and are about 2½ inches in height, resembling those customarily employed for such work. Each portable section is made up of the two rails fixed on a number of sleepers, five for instance. Some of these sections are made with the addition of an inverted U-shaped iron yoke, to carry the trolley wire, the sections with these yokes being placed about 80 feet apart on straight stretches of track, and of course closer together on curves. Each of these adds a hundred weight to the weight of the section in question. The two feeders from the generating stations are carried either on poles sunk in the ground in the usual manner, or on specially designed standards. A simple car has been designed for the purpose of erecting the trolley wire. The drum carrying the wire is supported on trestles on this car, and is run off over a pulley on a level with the trolley-wire supports, this pulley being mounted in bearings at the top of a double ladder on the car. The car itself is fastened to the rails while the wire is being run off, to allow of the necessary strain being put on the wire before the car and ladder are removed.—*The Electrician, London.*

Help to Light the Electrical Trust by subscribing for **ELECTRICITY.**

A YEAR'S WORK IN THE U. S. PATENT OFFICE.

Rapid Advance in Electrical Industries.

The annual report of the Commissioner of Patents for the calendar year 1897 has been laid before Congress. It was prepared by Assistant Commissioner Greely, who was Acting Commissioner for several months preceding the death of the late Commissioner Butterworth.

In 1897 there were received 45,661 applications for patents, 2,150 applications for designs, 94 applications for reissues, 2,176 caveats, 1,946 applications for registration of trademarks, 66 applications for registration of labels and 26 applications for prints. There were 23,729 patents granted, including designs, 65 patents reissued, and 1,671 trademarks registered. The number of patents that expired was 12,926. In proportion to population more patents were issued to citizens of Connecticut than to those of any other State—1 to every 786 inhabitants. Massachusetts followed next, with the District of Columbia, New Jersey, Rhode Island and New York in the order named.

The number of applications for patents received during the year 1897 is the largest in the history of the office, yet in all probability the number will be exceeded in the coming year.

The influence of patented inventions is most strikingly shown in the creation of new industries of enormous magnitude since 1880—that is, within the term of patents now in force or but very recently expired. Of these new industries the most noted are those directly connected with the development of electrical inventions, such as the manufacture of electrical apparatus and supplies, the supplying of electricity for lighting and power purposes, electric railways and the telephone.

The manufacture of electrical apparatus and supplies began to be of importance shortly before 1880, and in that year 76 establishments, employing 1,271 persons and producing an output valued at \$655,036, were in existence. In 1890 the number of establishments had increased to 189, employing 9,485 persons, and producing an output valued at \$19,114,714. The increase in this industry has been very great since 1890. No separate statement of electrical machinery exported is given in the statistics of exports for that year. In 1897 the exports of such machinery amounted in value to \$917,453. Besides this the exports of "instruments and apparatus for scientific purposes, including telegraph, telephone and other electric," amounted in value in 1897 to \$3,083,900, having increased to this amount from \$98,383 in 1880 and \$1,429,785 in 1890. In the electric light and power industry as reported in 1880 there were but three establishments in the United States, employing 229 persons and producing an output valued at \$158,400. In 1890 there were in the small portion of the country reported (the State of New York, the District of Columbia and the city of St. Louis), 144 establishments, employing 2,004 persons and producing an output valued at \$4,783,224. No statement of the extent of this industry in the whole country for the census year is available, but it is stated on what is believed to be good authority that in 1892 the aggregate capital invested in this industry in the United States was not less than \$350,000,000. At the close of 1894 there were in the United States 2,124 central stations supplying electricity for

light and power and 7,478 isolated plants, a total of 9,599 establishments. The capital invested in these central stations is stated to have been \$258,956,256, and the capital invested in the isolated plants, though not stated, was probably not below \$200,000,000. A conservative estimate of the number of persons employed at that time in this industry would not be under 45,000. The growth of this industry since 1894 has been steady and rapid. New central stations and new isolated plants have been put in use all over the country, and those already in use have been enlarged. The prospect of still larger growth in the future is assured.

The use of electricity for power purposes has found its most notable development in the electric railway. This is of very recent origin. The first electric

the United States up to October, 1897, was 13,765 miles, out of a total mileage of 15,718. The total capital invested was \$846,131,691.

The telephone is now recognized as a necessity of commercial life. The manufacture of the instruments has up to a very recent date been in the hands of the company controlling the original patent. Since the expiration of that patent the manufacture of telephones has become a considerable industry, but no statement as to its extent is available. The telephone in 1880 was just beginning to become commercially known. At the close of 1895 there were in the United States 927 telephone exchanges and 686 branch offices, using 459,728 miles of wire and employing 11,930 persons. The amount stated to be invested in telephone property was \$77,500,000.

The investment in electric light and power plants, in electric railways, and in the telephone represents to a large extent money paid for labor, either directly for the construction of buildings and the construction of railway roadbed, the stringing of hundreds of thousands of miles of wire, or indirectly in the manufacture of the materials and supplies necessary. The demand for copper, largely for electric purposes, has caused the output to increase from 60,480,000 pounds in 1880 to 265,115,133 pounds in 1890, of which nearly all was produced in the United States. In 1895 the copper produced in the United States, including that made from imported pyrites, was 392,639,964 pounds, valued at \$38,682,347.

It is to be noted with respect to the new industries based on patented inventions that none of them were immediately successful. The public is not quick to accept new inventions until their practical value has been amply demonstrated. The electric light was believed impracticable and its first installation was met by practical difficulties hard to be overcome. Only within a very few years has this light in either of its forms, the arc or the incandescent, become a light that could be depended on. The electric railway was accepted slowly, and its best type for city use, the conduit system, was first installed against the judgment of many of those believed to be best able to judge of its practical value. Even the telephone was at first believed, except by a few enthusiasts, to be nothing more than a toy.

None of the inventions on which these industries are based were in the form in which they were first patented commercially practicable. Even if it be conceivable that the primary inventions would have been made without the stimulus of the patent system, there would have been no inducement to inventors to spend time and money in perfecting and improving these inventions without the certainty that if made practicable and acceptable to the public their manufacture, use and sale could be controlled for a term of years through the protection afforded by patents. If a new device may be freely copied by rival manufacturers as soon as it appears upon the market, no one can afford to expend the large sums of money which are often found necessary in perfecting the invention, constructing the plant necessary for its manufacture, and bringing it before the public.

An international exhibition will take place at Dijon, France, from June to October, 1898. A special section is to be provided for electricity, and a new tariff has been fixed for the supply of power.

A SUCCESSFUL KENTUCKY GIRL.

MISS GLASCOCK, OF MAYSVILLE, KY.

Miss Glascock has been doing some very creditable electrical engineering work in her native State, and has recently submitted plans and specifications for an electric light plant to the City Council of Lawrenceburg. She has completed a plant at Morganfield and will superintend the construction of one in Nicholasville. Miss Glascock is a niece of A. R. Glascock of Maysville, Ky., where she makes her home.

street railway in the United States was put in operation little more than ten years ago. In 1880, of the 2,050 road miles of street railway in the United States nearly all used animal power. Electric power was not then used. Steam and the cable were used on a few miles. At the close of the year 1890 it is stated that the total mileage of street railways was 8,123 track miles, on 5,661 miles of which horses were used, the remaining 2,462 miles being mainly electric and cable. The capital invested in these roads was \$211,277,798, and 71,000 persons were employed on them. In 1894 the total mileage was 12,527, of which 7,470 was electric. The capital invested was \$648,330,755, of which \$423,493,219 was invested in electric railways. In 1896 the mileage had increased to 14,470, of which 12,133 miles were electric. The capital invested was \$784,813,781, and the number of persons employed was not less than 150,000. The total mileage of electric railways in

ELECTRICALLY OPERATED MOVABLE PLATFORMS FOR THE UNIVERSAL EXPOSITION AT PARIS.*

BY G. HAMELIN.

Among other important questions that the Commission of the Paris Exposition of 1900 is endeavoring to solve, is how to transport rapidly from one point to another the large number of visitors who are expected to be present. It is thought that there will be as many as 60,000,000 admitted. With such a large number of people, what would be the use of an electric railway or trolley that could at the most convey 10,000 travelers in both directions, especially at the end of the day when as many as 40,000 or 50,000 persons might be worn out sight-seeing and all anxious to get away? In the case of a railroad the wait between trains would be more or less long, depending on the headway at which the trains were run, and often at intermediate stations these trains would be obliged to pass without stopping, to the great disappointment of the travelers waiting at that station.

Among the various designs that have been submitted to the Commission of the Exposition, there is one that is especially interesting owing to its originality and the services that it will be called upon to render if it is adopted. This device is a movable electric platform having two different speeds, suggested by MM. Blot, Guyenet and De Mocomble. At the Chicago Exposition in 1893 a somewhat similar platform was in operation and gave general satisfaction; likewise during the last Exposition in Berlin a two-speed movable platform was erected for the use of visitors. It is necessary to go back to 1886, however, to find the origin of this system; at that time M. Blot took out a patent for an electric platform supported on rails operated by means of grooved pulleys upon which the rails rested. In 1889 M. Blot suggested the adoption of a platform based upon the same principle, but his proposition was rejected. M. Blot was, however, not discouraged, and after further perfecting his system took out another patent in 1895; M. Guyenet on his part also took out a patent on a platform somewhat similar to that of M. Blot. For the Exposition of 1900 MM. Blot, Guyenet and De Mocomble have adopted a combined system, consisting of a platform of two different speeds.

The plan consists as follows:

1. Of a high-speed platform of 1 meter in width, moving along a track having a gauge of .9 of a meter at a speed of 2.7 meters per second, or about 10 kilometers an hour.
2. Of a platform of reduced speed, .8 meter in width, moving along a track having a gauge of .45 meter at a speed of 1.35 meters per second, or at about half the speed of the platform previously mentioned.
3. Of a stationary sidewalk, .9 meter in width.
4. Of a narrow bridge in metal, supported by columns.
5. Of stairways to allow passengers to mount and descend.

Each platform is made up of a succession of trucks of two distinct types; the first is supported by 4 independent wheels; the second has no wheels, its extremities resting on the two neighboring trucks. The flooring is supported on wooden stringers which in turn rest on cross girders; the middle of each girder is fastened to an axial beam, the wheels of the trucks being situated at the extremity of the girders. The wheels run on iron rails, the latter being placed upon wooden stringers, which in turn rest upon iron girders. Every six meters the axial beam rests on cables some of which are stationary and only serve to sustain the system, while others are movable. A long beam would not allow of curves being readily passed over, therefore the axis or center beam has been divided into sections about 4 meters

in length, the joints being fastened securely together by means of hinges. This arrangement allows of curves with a radius of 60 meters being turned.

The rolling is made easy by the use of rubber springs which deaden the shock and noise. The propelling cables in turning cause the longitudinal beam to advance through adherence alone. The propelling cables are located 39 meters apart. At Chicago the system was so arranged that all the movable apparatus was drawn along, which in case of repair necessitated the stopping of the platform.

FIG. 1.
Transverse section of a station of the electric platform for the Paris Exposition of 1900.

In this case, however, the propelling apparatus being stationary could be readily examined without in any way interfering with the operation of the system, which in itself is a decided advantage. The propelling cables are operated by means of electric motors receiving current from a central power station. A stairway could be located every 200 meters to allow of persons reaching the fixed sidewalk of the platform, or movable inclined planes adopted such

FIG. 2.
General arrangement of the proposed electric platform for the Paris Exposition of 1900.

as are now in operation in the Louvre department store.

The public might apprehend danger in passing from a fixed sidewalk to a movable platform, but in this case there would be nothing to fear as the slow moving platform would have a speed of but 5 kilometers an hour—about as fast as a person would ordinarily walk. It would be no more difficult to pass from the low-speed platform to that of high speed than in the former case, owing to the relative movement of the two. At Chicago, moreover, no accident of this nature was reported.

The platform would pass through a portion of the Avenue La Motte-Picquet, l'Esplanade des Invalides, the Quay d'Orsay, and would return to its starting point by the Avenue de Suffren, after having

traveled a distance of 4,200 meters (about 2.6 miles).

With the system just described as many as 50,000 persons could be carried each hour, or even as many as 60,000 were the high-speed platform slightly widened.

The above number is certainly a great improvement on the 10,000 which is the greatest number that could be carried by means of an ordinary electric road, and there is not the slightest doubt but what the system proposed by MM. Blot, Guyenet and De Mocomble is a step in advance and would effectually solve the difficult problem of rapid transit for the coming Exposition, without taking into consideration the fact that it would be another attraction among the large number already promised.

PURIFICATION OF THE ELECTROLYTE IN COPPER REFINING.*

Much mystery has been made concerning the methods for the purification of the electrolytes which are used in modern copper refineries. The common assumption by copper refiners of possessing esoteric information is partly responsible for this, but a larger and more permanent cause is the very variable character of the material refined. It is evident that the soluble impurities derived from the crude copper anodes, which eventually find their way into the electrolyte and there accumulate, will differ according to the nature and amount of the minor constituents of the crude copper; thus it comes about that general methods, based on single examples, are likely to be inapplicable in the same degree and for the same reason as many published analyses of anode sludge, fluctuating in composition with every alteration of the raw material, are misleading. It is not to be supposed that it is in any way difficult for a competent chemist to devise a satisfactory method for treating an electrolyte so as to recover whatever constituents are worth retrieving, to eliminate those which are worthless or noxious, and to restore the solution to a working condition, but it is nevertheless useful to have recorded the details of such methods as have been approved by practice. Therefore in this article we have translated from the German the essential portions of a paper by Titus Ulke,

which appeared in a recent number of the *Zeitschrift für Elektrochemie*, and have made such critical comments on the statements there set forth as seemed necessary.

In the first place the systematic control of the composition of an electrolyte for copper refining is requisite, both in order to avoid the deposition of foreign metals at the cathode whereby the quality of the copper would be impaired, and also to maintain the strength of the electrolyte at its proper point. The copper content of the electrolyte tends to increase because the copper at the anode dissolves rather more quickly than it would if its rate of dissolution were strictly proportional to the current. This is due to the fact that copper exposed to the joint

*From the *Electrician*, London

*Translated for *ELECTRICITY* from *La Vie Scientifique*, Paris.

action of air and sulphuric acid slowly dissolves, irrespective of its function as an anode; copper containing oxide will, of course, dissolve faster than the metal free from this body and dependent for its oxidation on the presence of atmospheric oxygen. The proportion of copper thus dissolved to the quantity of copper dissolved electrolytically will be greater the smaller the current density and the more vigorous the circulation and consequent aeration of the electrolyte. Spontaneous evaporation—not to be neglected when the electrolyte is used slightly warm; e. g., at 30°C. to 40°C. = 86°F. to 104°F.—also tends to increase the concentration of the electrolyte, and thus from these several causes it comes about that there is a continual tendency for the quantity of copper sulphate in the tanks to augment until an elimination of a portion of it is a necessity. It is evident from this that the purification of the electrolyte should be accompanied by a withdrawal of a portion of its main constituent, copper sulphate.

At the great copper refinery of the Baltimore Copper Company a definite portion (about one-fifth) of the electrolyte is removed from time to time to be worked up for copper sulphate, and a suitable (but not necessarily equal) amount of pure copper sulphate solution is added so that the content of the electrolyte in impurities is diminished, and, at the same time, the strength of the electrolyte in copper sulphate is adjusted to its normal value. The importance of this regulation lies in the fact that in a large refinery containing a multitude of small units of plant it is essential for smooth working that the conditions of current density, resistance of solution and the like should be maintained as nearly uniform as possible. It is for this reason that any process of purification which would regenerate the electrolyte continuously instead of periodically would present many advantages.

Using this method, the Baltimore Copper Company produce a considerable quantity of copper sulphate, which is sold with profit to the Western Union Telegraph Company. The final liquors are precipitated with iron scrap to recover the last portion of copper, amounting to 2 or 3 per cent.

A similar system is in use at the Balbach Works, Newark (U. S. A.), where a portion of the electrolyte is concentrated for the recovery of the sulphates of copper, iron and nickel, and the mother liquor is finally boiled down in order to obtain arsenious acid and sulphuric acid. This description is decidedly vague. An ordinary copper electrolyte is not likely to contain nickel in quantity sufficient to allow of its recovery as sulphate, for although it is true that nickel is a constant concomitant of commercial copper, yet it is also true that it is usually present in quantities not exceeding 0.2 to 0.3 per cent. Further, the recovery of the sulphuric acid by any practicable boiling down process is sufficiently dubious. The natural extension of the idea of the precipitation of the copper by means of iron to the recovery of the whole of the copper by this means, has not led to any valuable result. The precipitated copper is comparatively impure, and the ultimate product, ferrous sulphate, is of very small market value.

At the works of Guggenheim Bros., Perth Amboy, a process is in use approaching the ideal already set forth of a continuous purification of the electrolyte. The method is a modification of that due to K. and H. Borchers, in which the liquid of each individual tank is circulated and at the same time aerated by a jet of air at a pressure of 3 or 4 lbs. per square inch blown into a vertical tube open at the top and bottom to allow the electrolyte to enter below and to be ejected above, impelled thereto by the effective alteration of head produced by the injected air. The electrolyte, clarified from its impurities, is little liable to deposit foreign matter on the cathodes; such mechanical contamination, due merely to the use of a turbid electrolyte, and in no way connected with the electrolytic separation of metals other than copper at the cathode, may be highly injurious to

the quality of the copper ultimately obtained and should be strenuously avoided. When the Borchers process was first described extravagant eulogy was bestowed on it. In particular it was said to cause the elimination of iron and arsenic from the electrolyte, and to remove all necessity for circulation of the electrolyte from vat to vat in the usual manner. These claims cannot be admitted, but nevertheless aeration and internal circulation of the electrolyte of each vat are useful, and yield excellent results when supplemented by occasional circulation of the liquid from tank to tank. In spite of this continuous partial purification the electrolyte at Perth Amboy needs periodical replacement. The liquor is run into lead-lined vats, and boiled with scrap copper with free access of air, so that the copper may be dissolved, the free acid neutralized, and the solution so enriched in copper sulphate that it can be readily crystallized to yield this salt. The copper sulphate is deposited on lead strips hung across the crystallizing tank. The mother liquor contains almost the whole of the antimony and arsenic, together with a small quantity of copper. The latter is precipitated by iron plates, on which the arsenic is also deposited as soon as the copper has been thrown down. Ultimately a black precipitate, containing as much as 60 per cent. of arsenic, is obtained. This may be worked up either for crude copper or for the production of arsenic compounds, such as Scheele's green, Paris green and white arsenic. In the Chicago Copper Refinery the bulk of the copper sulphate is recovered by crystallization, and the mother liquor is boiled down to a point at which both copper sulphate and arsenious acid crystallize out. The mixture is extracted with just enough water to dissolve the copper sulphate, which, being thus fairly freed from arsenic, is returned to the vats.

In the foregoing cases a part of the whole of the electrolyte is worked up for copper sulphate, and this purified recovered salt is returned to the process. Other methods have been proposed for the direct elimination of the chief impurities in the electrolyte and its restoration to a proper working condition without recourse to crystallization of the whole quantity of copper sulphate. These include boiling the liquor with metastannic acid to precipitate arsenic, filtration of the liquor through a layer of cuprous oxide, which is a base strong enough to precipitate most foreign metals as hydroxides, and oxidation of some of the impurities, notably iron, by aeration, and consequent precipitation of certain other impurities, e. g., arsenic as ferric arseniate. All these methods singly and conjointly have met with very poor success. Purification by means of tin added to the copper before it is cast into anodes, in the proportion of 2.5 lbs. per ton (say 0.1 per cent.), has also proved of only moderate utility. When the copper is very arsenical the tin in dissolving appears to retain the arsenic in the anode sludge, when it is less objectionable than in solution in the electrolyte; the presence of tin in the anode also makes the deposited copper smooth. These advantages, however, are not sufficient to make the application of the process generally remunerative.

One of the best methods of purification consists in electrolyzing the liquors from the depositing vats with a current density so high that all impurities save iron are deposited pell-mell with the copper. The operation is carried out in purifying tanks, of which a set of 12 is allotted to about 280 depositing vats. The cathodes in the purifying tanks are of sheet copper and the anodes are of lead. The process needs a somewhat large expenditure of current, and produces a good deal of impure copper; but it has the advantage that the copper is recovered as metal, which, though impure, is often more salable than is copper sulphate. The electrolyte, purified as regards arsenic and antimony, impoverished in copper, and still containing iron in solution, is brought up to strength with fresh copper sulphate and returned to the depositing vats, its purification and

return being repeated until the iron accumulates to an inconvenient extent, when the liquor is finally worked up for copper sulphate.

The variety of these methods makes it abundantly evident that there is no "best" or even standard process of purifying copper electrolytes, and that the merits of every suggested procedure must be considered not only from a chemical and technical point of view, but also with regard to local demands for by-products, such as blue vitriol and crude copper, and to local abundance of supplies of raw materials, such as sulphuric acid, scrap copper and the like. A process torn up by the roots, and transplanted to a distant site with different local conditions, is not likely to prosper.

ON THE MANUFACTURE OF LAMPS AND OTHER APPARATUS FOR 200-VOLT CIRCUITS.*

BY G. BINSWANGER BYNG.

(Concluded from page 151.)

SWITCHES.

I come now to the matter of adapting switches, wall plugs, ceiling roses, lamp-holders and minor fittings.

I do not apprehend any difficulty in changing existing types from the present standard of use to conform to the higher standard, yet maintaining the same appearance and size, and, when sufficiently in demand, approximately the same cost. The chief alteration will be in the increased break and better insulation of the two poles. In smaller articles, such as combined switches and lamp-holders, the difficulty, if any, is more apparent. A discussion bearing upon the subjects involving the use and con-

struction of double-pole switches, length of break, standardization of terminals, position of fuses, the carrying capacity of contacts, etc., would be, to my mind, of great value.

Without enlarging upon the subject of switches to an undue extent, I will show some specimens of different types I find to be satisfactory in practice.

Here (1) is a switch to take the place of the ordi-

nary link or tumbler switch, and (2) here is an ordinary double-break china switch. You will notice the formation of the china base, and the separation and action of the metallic parts, which are arranged to produce a long break and perfect insulation, so that an arc cannot be maintained if established, nor can a shock be communicated to the operator. I have also placed there enlarged drawings of wall sockets and ceiling roses, to illustrate my further remarks under this heading.

It is not necessary to go deeply into the subject of fixtures such as electroliers, pendants, etc., but in connection therewith I wish to refer to the question whether it is advisable to recommend the use of two or more low-voltage lamps in series on a 200-volt circuit. Within my own experience, I know of sev-

eral installations fitted originally with 200-volt lamps that have, by reason of greater expense for current, and an inferior light, been rewired for two 100 lamps in series, with satisfactory results. It is within the province of manufacturers to materially assist wiremen by designing fittings specially adapted to series wiring, such as series holders, ball fittings, brackets or electroliers with arms in multiples of two; and such a practice might be extended with advantage to many other details.

FUSES.

The question of fuses for higher voltage requires more careful investigation, and would repay thorough discussion. Central station engineers agree to differ upon the various points of efficiency, as evidenced by the different rules issued for our guidance. Some lay stress upon increasing the length of fuse wires, others insist upon ventilation holes, and in

some cases the height of covers is to be increased. But there is no unanimity between them, and none of these rules, in my opinion, indicates the right direction.

I have made some extensive experiments, and believe that the results are of interest to the profession generally.

When a circuit is opened by the disruption of a fuse, the combined metallic vapors and hot air produced by the high temperature of the resulting arc may extend and maintain it so as to bridge over the terminals, which, melting and becoming volatilized, feed the arc, and rapidly increase the temperature. I find, in practice, that under these conditions the china base supporting the fuse and terminals is easily volatilized also, and not only contributes towards the maintenance of the arc, but is ruptured as if by explosion, tending to set fire to any inflammable surroundings. This rupture has hitherto, I believe, erroneously been attributed to the expansion of air confined by the cover; hence the ventilation holes, which, according to my opinion, are useless. The same experiments tend to prove the fallacy of using a long fuse wire, with the concomitant disadvantages of finding space for it, and also difficulty in renewal; and I feel sure that full efficiency may be attained with a short fuse.

My deductions from the aforesaid experiments are that—

- (1) It is essential to arrange a fuse wire so that it will break at a definite part of its length, i.e., approximately, the center.
- (2) The arc formed on breaking the fuse must be so confined that it cannot be maintained so as to damage the terminals, base, or cover.

I will now describe how I have carried out these essential points in china cut-out boxes, which are the general type of fusible cut-outs used in house installations in this country.

These fuses are arranged on china bases, or in groups upon cut-out boards, and their carrying capacity varies from 1 to 100 amperes. In all these I provide what I call a "fuse chamber"—i.e., a round china wall forming a central hole, from $\frac{1}{2}$ inch to 1 inch in diameter—and this is pierced with two holes near to the terminals, which are fixed upon the base outside the wall. The wire is threaded through the holes from one terminal to the other, passing through the fuse chamber. Both ends of the fuse wire are supported by a material which is a better heat conductor than air, whilst it is free in the central fuse chamber. Thus the same current raises the temperature of the fuse wire within the fuse chamber more rapidly than at the supported ends, therefore the disruption takes place there, and the resulting arc is enclosed. I find, however, that china as an isolator is not sufficient, because of its tendency to volatilize under the high temperatures—a fact I have already mentioned. Therefore I line the interior of the chamber with another material which is a better heat conductor and less liable to fracture, and I find that ordinary plaster of paris is most convenient for this purpose, although several other substances may be equally efficient.

Fuses constructed on this principle require but a short length of wire, and are perfectly safe on high voltages, and the general appearance and size does not differ to any great extent from those now in common use. The principle once established of surrounding part of the length of fuse wire with a substance that is a better conductor of heat than air, we can easily construct any other type of fuse upon the same principle.

Fuse wires enclosed in glass tubes filled with plaster or cement, but with a free central space for fusion, for instance, fulfil the same conditions.

I find that such fuses have been patented by Mr. Mordey in 1890. The mere fact of enclosing a fusible wire in a non-conducting refractory filling would not fulfil the essential functions of a perfect fuse as I have described, without a clear space at or about the center for disruption. Mr. Mordey describes

such a space in his specification, but it is for the purpose of observation only, and it is not clear from the tenor of the specification that the inventor had this purpose of the localization of fusion in mind. Mr. Miller of Kensington has also altered the ordinary Edison fuse by substituting thin copper wire, and partly filling the center with asbestos fiber. So far as localizing the point of disruption and confining the arc, this fuse acts very well, although copper or alloyed fuses are not perfect under any circumstances, by reason of the maintenance of a dull red heat under normal load.

ARC LAMPS.

Coming now to the subject of arc lamps in relation to the higher pressure, I do not see that with alternating currents the increased potential materially affects the consumer. The practice may bring a single-parallel system into vogue, with economy coils—an alteration which will, in my belief, increase the commercial efficiency of alternating arcs. But the disadvantages are apparent in the case of a continuous current circuit. For instance, in small installations of one or two lamps on the 100-volt circuit, these must be doubled on the 200-volt circuit, or useless resistances interposed. To equalize the conditions it has been proposed to substitute low-current lamps—say four 5-ampere instead of two 10-ampere lamps.

As this substitute has been advocated by one of the foremost central station engineers, and many others will possibly follow him, it may be useful and not out of place to prove that both in theory and practice low-current arc lamps are deficient in points of economy and efficiency.

It is generally accepted that the current-density of an arc is independent of its size; assuming this as correct, the area of an arc must be proportional to the current, and the cooling surface proportional to its diameter. This is the case with the cooling surface of the carbons, if these are used of areas proportional to the current taken by the lamp. Thus the cooling effect of the atmosphere will have a direct relation to the diameter of the arc and to the square root of the current. Therefore, for illumination, large arcs are more efficient than small ones, and the practical arc is attained when the benefit of increasing the number of light centers balances the inefficiency of small arcs. This gives, in practice, an arc of about 10 amperes.

Small arcs worked under same conditions are more unsteady than large ones, which is due to the fact that with an arc of a given length the EMF. decreases as the current increases. An experiment in which a fixed length of arc at 5 amperes and 44 volts was suddenly increased from 5 amperes showed—

Normal.....	5 amperes	44 volts
Sudden increase from 5 to 6 amperes.....	40.5 "		
" " " 5 " 7 "	38.5 "		
" " " 5 " 8 "	37.2 "		
" " " 5 " 9 "	36 "		
" " " 5 " 10 "	35.2 "		

So an arc, or series of arcs, with a total voltage approximating to the EMF. of the circuit is unstable and fluctuating—probably due to the disproportionate variations of the cooling surface, coupled with the decreased resistance of carbon at higher temperatures. If the arc flares, the current will increase, unless there is sufficient resistance in series to reduce the voltage across the arc at a greater rate than the above figures show. Certainly the mechanism tends to lengthen the arc, but to no advantage, because the movement continues until the current decreases to the normal value, and the acceleration would extinguish the arc unless an interposed resistance allowed of a rapid increase of the voltage across the arc. Such a resistance is necessary to compensate the "negative resistance" of the arc, which may be more appropriately termed "decreased cooling surface per ampere." An additional resistance in series is necessary to ensure steadiness. It follows, therefore,

that 5-ampere lamps must be worked on a higher EMF. or "pumping" will ensue.

The possible current through four lamps on 200 volts, allowing 40 volts across each arc, is 5 times the normal; with five lamps on 230 volts, 7.6 times the normal; while with four lamps on 230 volts it is only 3.3 times the normal. Therefore, when 5 ampere lamps are used upon a 230-volt circuit, it is better to run four with steady long arcs than five with unsteady short arcs.

It is probable that the enclosed arc lamp will be brought into prominence in this direction, offering certainly many advantages; but I would point out that in practice the current cannot be largely increased, because of the fragility of the enclosing envelope under an accession of temperature. If the cooling surface be increased so that the temperature of the gases surrounding the arc remain about the same, the efficiency of the lamp is considerably reduced.

Adverting to the manufacture and installing arc lamps to meet the contingencies of the high voltage, we have to consider that, if the carbons run short or the slides stick in one lamp, the other lamps close together, and the full voltage of the circuit is maintained across the shunt coil of that particular lamp. The possible troubles are that the shunt coil is burnt up, and that the carbon-holders are damaged with the excessive flaring of the arc before it breaks.

It would hardly be practical to make magnets to stand such overload. Of course we can install a cut-out and equivalent resistance to each lamp. But this expedient is very costly, and presents the further difficulties of finding suitable room near the lamp or making it self-contained with the lamp, and of teaching the consumer that the full current can be used although the lamps are not alight.

Some sort of cut-outs must be installed, and I am of opinion that there is a field for inventors in this direction. I will indicate how I have endeavored to meet these difficulties.

If, as is generally the case, one pair of carbons burn at a greater rate than the others, the slide in that lamp will touch the stop first, and the stumps will burn away until the gap is wide enough to break the arc. I append a table showing the results of five trials:

FOUR 10-AMPERE LAMPS ON 200 VOLT CIRCUIT.

+ carbon 18 mm. corod. — 11 mm. solid.

- | | | |
|-----|---|----------|
| (1) | Arc flared and was extinguished at..... | 1½" gap. |
| (2) | " " " " " " " " " " " " | 1¼" " |
| (3) | " " " " " " " " " " " " | 1" " |
| (4) | " " " " " " " " " " " " | 1½" " |
| (5) | Current switched off when arc was at... | 2½" " |

In the first four trials the arc broke while flaring; that is to say, it traveled up the side of the carbon and ignited the loose dust, taking a spiral course, this course being continued until the length is too great for the voltage. The arc only leaves the point of the carbon when there is sufficient dust to maintain it and counteract its increasing length; thus, when the supply of dust fails, the arc is extinguished before it can return to the points.

During trial No. 5 the carbon became pointed and the temperature rose to the extent of freeing the surface from dust, hence the arc did not leave the crater.

We deduce from this the desirability of maintaining a considerable gap between the carbon-holders, exceeding even 3 inches. For absolute safety it is better to extinguish the arc automatically. Now an automatic switch is useless, because it is necessarily controlled by the potential across the lamp, and could not discriminate between the increased voltage caused by the carbons burning short and that caused by the extinction of a flare; and, since this may happen at any time, the arc could not be re-formed even when the carbons came together. The circuit, in fact, would be inert, and the arc would have to be re-established by hand.

An efficient cut-out must extinguish the arc, and simultaneously cut the shunt coil out of the circuit,

the mechanism of the lamp also being free that the carbons may travel together. The shunt must on no account be cut out whilst the brake is on, since it could not then compensate the series coil and draw the carbons together.

For the protection of the shunt coil I have used a temperature fuse made of an alloy with a melting point of 210° Fahr., and having sufficient sectional area to be independent of the amount of current likely to traverse it. The carbons could be held apart several minutes before fusion took place. Although a decided advantage was gained over a plain lead fuse, and the shunt coil was efficiently protected, the carbon-holders were not protected, and the fuse required renewing each time it became ruptured.

The chief difficulty in constructing an automatic "cut-in" and "cut-out" lies in the necessity for a rapid make or break, to save vibration and sparking. My system may be briefly explained, in that the arc is first short-circuited through a shunt path, and so put out by reducing the voltage across the terminals. This short is then broken by a quick break switch, the same action reversing the shunt switch simultaneously, ready to fall upon its normal contact when the carbons touch or are replenished. The mechanism is actuated by the main armature of the lamp, and the movements take place while the armature is below the feeding point, so as not to interfere with the working of the lamp.

HEATING AND MOTORS.

The effect of the increased pressure upon such applications of the house current as heating, cooking, etc., does not entail a sufficient alteration structurally or electrically to need an exhaustive description.

The resistances forming or causing the heating surfaces must be arranged to conform to the higher EMF. at the terminals, and it is mostly preferable to increase the length rather than decrease the diameter of the resistance wires; but this fact presents some difficulty in such articles where the space available is small. If the space is too limited, such apparatus can only be used in series, or in connection with an external resistance.

With motors, the greatest difficulty also lies in adopting the smaller sizes, say from one-twelfth H.P. to one-sixth H.P., to suit the altered conditions of higher pressure. A certain structural alteration is doubtless necessary to arrange a new winding to produce the same efficiency as heretofore on a 100-volt circuit. In the larger sizes, I am, in order to facilitate keeping stock, using a double or differential winding, which, when coupled in parallel, conforms to 100 volts pressure, and with the same winding in series gives an equal efficiency on a normal load at the 200-volt pressure.

In reviewing the subject of higher voltage generally from a standpoint of cost, I am of opinion that sufficient time and experience naturally resulting from an increased demand will place the cost of most fittings for 200 volts within the margin of those of the lower voltage—except, perhaps, a few cases, among which I may instance incandescent lamps. These will necessarily always be more expensive, owing to increased cost in mounting of larger bulbs and extra supports, and also through increased time of exhaustion and percentage breakage.

But we must not overlook the fact that in the matter of wiring there must be a decided saving. The smaller sectional area of conductor per lamp employed, without the necessity of increased insulation, as also in a minor degree smaller connectors and contacts, will in all probability compensate some other apparent disadvantages, and may bring the balance of cost in favor of the high-voltage system.

I do not wish to bring the subject of cables and wires or wiring systems within the scope of my present paper; but I will only mention that, in my opinion, such matters as the establishment of revised wiring tables, the use of twin wires, the smallest gauge allowable for single lamps, the best and

cheapest system of wiring for high-voltage supply, would be subjects well worthy of the immediate consideration of, and an interchange of opinion between engineers and manufacturers.

ELECTRICAL EXHIBITION NOTES.

Mr. Fred Catlin, the manager of the Telegraphic tournament, has completed the preliminary arrangements for that contest, and has arranged the classes. Circulars on this subject will be ready this week for general distribution, and there is already a great demand for information on the subject from all parts of the country. Mr. Catlin informs the Exhibition management that the entries will probably be more numerous than at any other tournament that has occurred, and thinks that some of the records will be phenomenal. It is proposed, in addition to the regular contest, to have interesting exhibits of telegraphic skill in novel directions. Mr. Jesse H. Bunnell, the electrical manufacturer and veteran operator, is taking a deep interest in the contest, and has volunteered to equip the whole stage with the necessary apparatus for the competition in the shape of keys, sounders, batteries and auxiliary appliances. Mr. Bunnell is desirous to have a separate prize offered for an "old timer's class," and has already entered himself for that contest. He has the reputation, dating from the war, of being an unusually fast and skilful operator.

Mr. H. V. Parsell, the well-known banker of this city, who has long been interested in electro-deposition work has kindly placed in the hands of his son, Mr. H. V. Parsell, Jr., the electrical engineer, for exhibition at Madison Square Garden during May, a marvelous collection of galvanoplastic work, done during a long series of years. It may be doubted whether any other amateur could possibly show anything approaching this remarkable collection in beauty and interest. It will not only include several striking pieces, as large as 25 inches by 25, reproducing celebrated works of art and famous men, but will comprise a large number of coins, medals and facsimiles of antique gems. The most extraordinary part of this collection, however, will be that which embraces the reproductions from natural objects. It is safe to predict that there will be a crowd around these exhibits all the time. The manner in which they are made, for example, is of deep interest. There are, for instance, snakes and frogs which have been made to the life and from the life. The snake is etherized under a bell jar, then taken out and greased with sweet oil and replaced in the bell jar while a sufficiency of thin plaster is mixed with warm water. The snake is then placed on a glass plate and posed. Around him is built an enclosure of four square bars, and the plaster is slowly poured over the snake, the bars confining the cast in a rectangular shape. When the plaster is hard, it is freed from the sticks and glass plate and the now defunct reptile is carefully removed tail first from his intaglio impression. The plaster cast thus obtained is rendered waterproof by immersion in molten paraffin. A metallic conducting surface must now be given to the interior of the cast. This is done by moistening the surface of the mould with a solution of silver nitrate and by exposure to sulphuretted hydrogen, precipitating the silver on the cast. A conducting wire is now fastened around the edge, and the mould is carefully suspended in the depositing bath. A good firm coating takes about three days to form, and then the mould is softened in boiling water and carefully broken off.

People have often heard of the incinerating effects of high frequency currents, but rarely get any practical demonstration. The attention of the electrical and daily press has lately been drawn to the grim fate of various birds that had in an unfortunate moment perched on some of the high tension wires of the power transmission circuits in California. Mr. George P. Low, the well-known electrical engineer of San Francisco, has preserved the remains of two eagles, some storks and other birds which had short-circuited part of the current while sitting on the wires, with the result of leaving only their beaks and talons, not a vestige of their bodies and feathers being discovered. Mr. Low is forwarding these curious relics to the Electrical Exhibition, where they will be mounted in such a position as to show how the

thing happened and just what happened. It will be the first exhibition of the kind that has ever been made.

It is proposed at the Exhibition to have amongst other railway apparatus a working model of track intended to demonstrate the operation of the third-rail system as applied to steam railroads. Col. N. H. Heft, the electrical engineer of the N. Y., N. H. & H. Railway Company, whose work is so widely known in connection with the third-rail line between Hartford and New Britain, Conn., has very kindly placed at the disposal of the management blue-prints showing the construction of the track and some of the actual material used. The model track, from 50 to 100 feet long, single and double, and about 5 inches gauge, is now being constructed on Col. Heft's plans, and will be shown in actual operation during the continuance of the show, the details of the track being imitated as closely as the conditions will allow. Over this track a train of cars will run to and fro continually, showing how the current is picked up and delivered to the motor and how the switches and signals are included in the operation.

A Two Hundred Mile Electric Railway.

We stated in our last issue that the passage of an ordinance by the city council of Kenosha, Wis., enabled the building of the only remaining link in an electric railway from Chicago to Green Bay, Wis., a distance of 201 miles. This is explained by the fact that a portion of the road is already covered by tracks, and the Kenosha franchise was the last required to complete the right of way. The new road is being built by piece work. About sixty miles of the track of the Fox River line, connecting Milwaukee and Green Bay, will, it is said, be laid next summer and fall, and many miles of construction work were completed during the winter. The Milwaukee, Racine & Kenosha Electric Railway is in operation from Milwaukee to the Kenosha city limits on the north, covering a distance of thirty-five miles. Another piece of the system is an electric line connecting Waukegan and North Chicago, lying four miles to the south of Waukegan. Between Waukegan and Evanston a good many miles of track have been laid. The distance from Evanston to Chicago is covered by the Chicago, North Shore Electric and the Chicago, Milwaukee & St. Paul. Though the latter road is operated by steam it is soon to be equipped with electricity, so that an entrance to Chicago from Evanston can probably be secured without great difficulty. The Fox River line will reach Milwaukee very shortly after the frost leaves the ground. The sixteen miles construction between Kenosha and Waukegan will require no longer than three months' time at the outside, and while that bit of track is being laid the connection between North Chicago and Evanston will be accomplished.

The charter of the Milwaukee, Racine & Kenosha road permits the carrying of passengers, baggage and express, but it is understood the Fox River line between Milwaukee and Green Bay intends doing a freight business also. Its passenger cars will be almost as weighty as an ordinary steam railway coach and carry motors of double the power of those used on the ordinary heavy electric railway coach.

Removed to Better Quarters.

The Eureka Tempered Copper Works of North East, Pa., have rented spacious quarters for their New York office at 107 Liberty street, where they have placed a large stock of their celebrated commutator bars, with drop forgings and cast, new and assembled commutators, all types of knife switches, lugs, wire gauze brushes, segments and brushes for arc lighting; and are equipped for furnishing practically everything in the copper line demanded by the electrical trade. In their new location they are better able to meet the demands of their large Eastern trade than ever heretofore, and contemplate a large increase in their already well-established business.

The Joint International Meeting at Laredo, Tex.

The joint meeting of the Texas Gas & Electric Light Association, the Texas Street Railway Association and Mexican gas, electric light and street railway men, at Laredo on the 9th, 10th and 11th inst., was one of the most successful meetings of gas and electric men ever held in Texas. Several papers on subjects interesting to the delegates were read and discussed, and the question of amalgamating the two associations named was decided in the affirmative, the name selected for the new organization being the Southwestern Light & Street Railway Association, and its territory covering all the Southern States and Mexico. Several excursions were provided for those attending the meeting, and a superb band from the City of Mexico, which was present by the courtesy of President Diaz, regaled the delegates and the citizens with the finest music ever heard in the town. A committee was appointed to prepare and design a silver plate to be presented to President Diaz for his courtesies extended to the International Convention. The committee on permanent organization reported the following officers for the ensuing year, and they were unanimously elected: Carl F. Drake, president; J. H. Fitzgerald, first vice-president; E. Duestrow, second vice-president; W. H. Weiss, third vice-president; E. L. Wells, secretary; F. Fries, treasurer. The Association will meet next year at Aussin.

Good Books for Electrical Students and Others.

Norman D. Henley & Co., of 132 Nassau street, New York, the well-known publishers of electrical and scientific books, are handling a large number of new and valuable works that should prove of interest to electricians and all other practicable people. Among others the above firm have recently published and are offering a set of five of Prof. T. O'Connor Sloane's works, entitled respectively "Arithmetic of Electricity," a practical treatise on electrical calculations of all kinds; "Electricity Simplified," which describes electrical phenomena in a way that can readily be understood by anyone; "Electric Toy Making," a work especially intended for ama-

teurs; "How to Become a Successful Engineer," which was especially prepared with a view to guiding young men who cannot afford a collegiate education, and Prof. Sloane's well-known "Standard Electrical Dictionary," brought thoroughly up to date. The five books are enclosed in a neat box. The regular price of the set is \$7. They offer the set complete, if ordered at one time, at \$5.

This set of books, as will readily be seen, covers the field of electricity very thoroughly, and will be found indispensable to persons interested in electrical science. Those desiring books of any practical nature would do well to send to Norman D. Henley & Co. for their large 96-page catalogue, which covers every branch of practical science and will be sent free on request.

LEGAL NOTES.

George H. Little has applied to the Circuit Court at St. Louis for a writ of mandamus to compel the officers of the Chicago & St. Louis Electric Railroad Company to allow him to see the books of the company. The company was formed some years ago for the purpose of building an electric railroad between St. Louis and Chicago, but the matter was not put through, as predicted at the time by *ELECTRICITY*. It was a stockjobbing scheme of the most transparent character, and the wonder is how anybody could have been induced to invest in it. An examination of the books will serve a useful purpose, but it is doubtful if the men who paid for their shares will find any consolation in it.

At Atlanta, Ga., Judge Lumpkin recently granted an order authorizing the foreclosure of a mortgage of \$24,500 principal and \$5,097.62 interest in favor of D. H. Livermore and held by J. F. Leary, against the Atlanta Electric Railway Company. Judge Lumpkin's order is a result of the case of D. H. Livermore for the use of J. F. Leary against the Atlanta Electric Railway Company, and the foreclosure of the mortgage practically means that the property will be sold at an early date. The mortgage covers all the properties of the street railway company, 14,935 feet of track, including its franchises, power houses, rolling stock and equipments, and its donations of land and all property of every kind now owned or hereafter acquired by the company.

In the case of James P. Fay against the Galveston City Railway Company and Receiver R. P. Baer, for \$40,000 damages for the death of a child, a verdict was given in the United States Court at Galveston, Tex., on the 12th inst. in favor of the plaintiff for \$13,500. The suit had its origin in a street car accident in which a little child was killed and its mother injured. The case was brought into the Federal Court by reason of the car company's property being operated under a receivership created through the United States Court.

CANADIAN NOTES.

There is a good deal of favorable criticism of the kindly action of the Royal Electric Company of Montreal in coming to the assistance of the Laachine Rapids Company, whose power house was burned during the first part of the present month. The Royal lighted Westmount and Mile End for its competitor without charge for several days.

The Electric Reduction Company of Buckingham, Que., have placed an order with the Canada Electric Company for a 1,000 horse power revolving field generator to be used for electrolytic work.

The Welland, Ont., Aqueduct & Power Company has been organized with a capital of \$25,000 to supply electricity for light, heat and power.

Engineer Leyden of the Cataract Power Company has submitted to the city engineer of Hamilton, Ont., a proposition for running the sewage disposal works by electric power, but at present it is not known whether this scheme will be adopted.

Proposals Invited.

The U. S. Navy Department, through the Bureau of Supplies and Accounts, is inviting sealed proposals until April 5th for furnishing the Norfolk, Va., Navy Yard with 1,000 electric lamps, 16 cp.; 800 Edison lamps, 32 cp.; 60 pounds fuse wire, 1 to 80 amperes; 50 pounds solder, wire; 10 bottles Yagers soldering salts; 400 pieces cut sheet mica; 400 hard vulcanized fiber washers; 100 Edison fuse plugs; 20 midget 2-wire cut-outs, and other supplies.

Blank proposals can be obtained upon application to Edwin Stewart, Paymaster General U. S. Navy, Washington, D. C.

The General Electric company owed on January 1, 1898, \$1,389,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

THE NEWS.

What Is Going On in the Electrical World.

STREET RAILROADS.

Albany, N. Y.—Among the bills passed in the Assembly last week was Mr. Eldridge's, providing that the State Railroad Commission may approve in whole or in part an application of a street surface railroad company for permission to construct its road.

Brooklyn, N. Y.—The Brooklyn Heights Railroad Company has made arrangements to put down new and improved rails on nearly forty-five miles of its tracks within the next six months, at an expenditure of \$600,000. The new rails will be laid on the Flushing and Graham avenue line, the Bensonhurst line, the Third avenue line, the Crosstown line and Court street line.

Chicago.—John C. Schaffer of this city is reported to be organizing a scheme for an electric air line railroad from Detroit to Toledo. The road is to be built after the most approved pattern of steam roads and will cost, including equipment, about \$500,000. Chicago, Pittsburgh and Detroit capitalists are interested in the scheme.

Danville, Cal.—A survey is being made of a route for an electric railway to run from Haywards to Danville, with an ultimate terminus at the summit of Mount Diablo. A branch road will connect at San Ramon and run to Livermore.

Delaware, O.—B. W. Brown and associates, who recently bought the Delaware Street Railway at the receiver's sale for \$24,000, have returned the property to the receiver. Their purchase was conditioned on an extension of the bond time and the retaining of stock by some of the old stockholders. Both conditions failed and the sale was declared void.

Delhi, N. Y.—An electric railroad is projected between Delhi and Bloomville. "It is calculated," says the Middletown "Argus," "that the road could be built and equipped for \$9410 a mile and that the road will earn \$22,630 a year and can be operated and maintained at a cost of not exceeding \$9,360, thus leaving a net profit of \$13,270. Among the items of earnings is 500 cans of milk a day, which at five cents a can would yield \$9,125 a year."

Doylestown, Pa.—The Bucks County Railway, by vote of the stockholders, has been leased to the Doylestown & Willow Grove Traction Company.

Dover, Del.—The route for the proposed electric railway between Milford and Dover has been surveyed and work on the line is expected to begin very soon. The road will pass through Frederica and Camden, and steamboat connections will be made at Milford. It is also proposed to extend the road to Slaughter Beach, on Delaware Bay, and make steamboat connections for Philadelphia and Cape May.

Dudley, Mass.—The selectmen have signed the franchise to the Webster and Dudley Electric Railway. The \$5,000 of the road as per stock taken has been paid in and deposited in the local National Bank.

Lewiston, Me.—The Electric Railway Company has signed a contract with the Cabot Manufacturing Company at Brunswick for 1,000 horse power. The Cabot Company expects to have the requisite machinery in place and the transmission line completed so as to furnish power to the railway by the 1st of July.

Manchester, N. H.—In the report of the New Hampshire Railroad Commissioners, just issued, the financial condition of the various street railroads is stated and nearly all of them are making fair profits. There are seven street railroads in the State, having an aggregate of 74 miles of track. The total capitalization is \$1,650,219.

Philadelphia.—The trolley road to the League Island Navy Yard, built by the Union Traction Company, has been thrown open to the public. The power for the new line is supplied by feed cables from the power house at Thirteenth and Mount Vernon streets.

Plainfield, N. J.—The Plainfield Street Railway Company, which has been using power from the Plainfield Electric Light Company's station, will erect a power-house for its own use.

Providence, R. I.—The Inter-State Electric Street Railway Company, operating a long line in this State and the Attleboros, is contemplating the erection of a power house. At the present time the road gets its power from a Pawtucket concern, and it is understood that the officials of the electric road have decided to erect a fine plant of its own at some point along the line, either in Pawtucket or in one or the other of the Attleboros.

Rome, N. Y.—It is probable that the long talked of connection of Rome and Utica by electric railway will become a fact before the summer season is over. The Utica Suburban Railway Company has filed a certificate of extension of its road in the direction of Rome with the county clerk, and this is taken as an indication that the project will be put through at once.

Shenandoah, Pa.—The reorganization of the Shenandoah Street Electric Railway Company has been effected by the election of Hamilton Godfrey of Reading as president, H. C. Geisner of Reading vice-president, J. W. Johnson of Shenandoah treasurer, and Dr. H. D. Rentchler of Ringtown secretary. This railway will connect Shenandoah with Ringtown and other towns in the Catawissa Valley.

St. Joseph, Mich.—A syndicate of capitalists, headed by Col. George H. Allers and Milton Weston of New York City, have applied for a franchise for an electric road to enter Renton Harbor. The line will run east to Sister Lakes, Dowagiac and Kalamazoo and is to be completed early in July.

Valparaiso, Ind.—The county commissioners of Porter County have granted a franchise to the Hobart & Western Electric Railway Company to build and operate an electric road through Porter County. The line will be known as the Valparaiso, Flint Lake & Chicago Electric Road. It will go through the principal towns in the county and also connect with East Chicago, Whiting, New Chicago, Hammond and Hobart.

Woonsocket, R. I.—The property of the Blackstone Valley Street Railway Company has been sold by the sheriff to satisfy a judgment in favor of John A. Courtemanche, the builder of the car barn of the road. The property was knocked down for \$2,733 31 to Thomas F. Sullivan of Millbury, who acted for the company.

LIGHTING PLANTS.

Caldwell, O.—This town has decided to issue \$2,000 in bonds to complete its waterworks system and \$7,000 for a new electric light plant.

Cripple Creek, Col.—The Hayden Electric & Mining Company, which was recently granted a franchise by the city council, has begun the work of setting its poles in the streets of the city and has announced that everything will be in readiness for supplying the city with light inside of 60 days.

Des Moines, Ia.—The House has passed the McCaskey-Holcomb curative act, and the bill has gone to the Senate. If the Senate passes it, the city of Des Moines will be able to complete the contract with the McCaskey-Holcomb Company for the erection of the municipal lighting plant.

Lamar, Col.—The citizens will vote April 5 on a proposition to grant a franchise for an electric light and steam-heating plant and telephone exchange.

Mantua, N. J.—An electric light plant will be established at Jessup's Mills for the purpose of lighting Mullica Hill, Jefferson, Alcyon Park and adjoining towns.

Mercersburg, Pa.—The citizens of this place are preparing to put in an electric light plant which will be run by water power two miles distant.

Newark, N. Y.—The Legislature has allowed an appropriation not to exceed \$20,000 for a new power house at the Custodial Asylum. The building will include a dynamo room for the electric lighting of the institution.

New Paynesville, Minn.—The proposition to erect waterworks and an electric light plant was carried at the recent election. Bonds for \$8,000 will be issued for this purpose.

Oakland, Md.—At the election held here on the 14th inst., the vote was more than three to one in favor of issuing bonds to the extent of \$30,000 for the purchase of the electric light plant and building waterworks.

Ocala, Fla.—The city council has decided to erect a new electric lighting plant and appointed a committee to prepare plans and specifications.

Pittsfield, Me.—F. L. Smith of the firm of Smith & Conant Bros. states that his firm, if granted the right by the town, will put in a lighting plant at once to furnish 30 arc lights and 1,500 incandescents.

St. Paul, Minn.—Members of the city council are discussing the advisability of introducing an ordinance with the view of creating a municipal lighting plant; the plan contemplates lighting the entire city with electric light.

Starkville, La.—The executive committee of the board of trustees of the A. and M. College have ordered the erection of a two story shop building and the equipment of the physical and electrical laboratories, including a dynamo for lighting the buildings and grounds of the college with electricity.

Vicksburg, Mich.—At the election here on the 14th the ticket favoring waterworks and electric lights was the only one voted for.

Wesson, Miss.—A committee, including Mayor Buckley, is making investigations with a view of getting an electric light plant of sufficient capacity to light the city.

MANUFACTURING, ETC.

Cleveland, O.—The Navy Department at Washington has placed a very large rush order with the Jandus Electric Company of this city for the "Jandus" (formerly called "Manhattan") enclosed arc lamps.

Johnstown, Pa.—The Stinemans Coal & Coke Company has closed a contract with a Chicago firm to equip their colliery No. 2, at South Fork, with a complete electric haulage plant.

Lynn, Mass.—Thirty-six men employed in chipping castings at the River Works of the General Electric Company, have gone out on strike. The "Item" states that "a year ago Superintendent Fish made an agreement to pay \$2.80 a ton for chipping, piece work, with an hour rate of 15 cents per hour. This has been paid, but lately the company has cut the price. Last week the men were paid at the rate of 14 cents per hour. This week they were to be paid at the rate of 13 cents per hour. This was more than the chippers were will-

ing to stand, and they struck. Now they demand a rate of 18 cents per hour."

Peru, Ind.—The Electrical Manufacturing Company, finding its present quarters inadequate, is preparing to erect another large building. The product of the plant consists of electrical supplies.

COMPANY MATTERS.

Annapolis, Md.—A bill has been introduced in the Legislature incorporating the Heat, Light & Power Company of Baltimore. The incorporators are Joseph P. Smith, Bertram S. Morrell, John William Kaiser, Bernard J. Narthan and Theodore E. Dollard. The capital stock is to be \$10,000. The company is empowered to construct and operate overhead wires for illuminating purposes and also to furnish motive power for machinery and for such other purposes as electricity may be used.

Bridgeport, Conn.—The Crocker Electrical Company is about to open offices here and will be prepared to furnish all lines of electrical supplies, dynamos and motors. E. C. Crocker, who is at the head of the new concern, is one of the best known electricians in the State.

Columbia, S. C.—The People's Electric Light Company has elected the following directors: Frank P. Carpenter, L. Melville French, George Wallace, Aretas B. Carpenter, Alvin F. Sortwell, all Northern capitalists, and B. L. Abney and E. W. Robertson. A meeting of the directors will be held in Boston soon and the organization of the company then perfected by the election of officers. Application will be made to the city council of Columbia for permission to run wires through the streets. The electricity will be secured from the Water Power Company.

Grand Rapids, Mich.—The Peninsular Light, Power & Heat Company has filed an amendment to its articles of association reducing its capital stock from \$20,000 to \$10,000 and the number of shares from 800 to 400.

Naugatuck, Conn.—A. M. Young, president and treasurer of the Naugatuck Electric Light Company, has bought the entire holdings of B. G. Bryan in the company, giving him a controlling interest. The plant will be enlarged and improved.

Newark, N. J.—The Cassidy Electrical Switch Company has filed articles of incorporation with the county clerk. The object is to manufacture and sell electrical machinery and otherwise engage in electrical business, with the principal office in East Orange. The capital stock is put at \$100,000, with \$1,000 paid in, and the incorporators are John C. Cassidy, Pottiel R. Bomeiste and Howard K. Wood, all of East Orange.

Newport, R. I.—The two companies which held charters granting rights to run an electric railway from Newport to Fall River have united under the name of the Newport & Fall River Electric Railway Company. The companies which consolidated to form the new company are the Fall River & Stone Bridge and the Middletown & Portsmouth railway companies. The officers of the new company are: President, Stillman F. Kelley; treasurer, E. L. Saltonstall; secretary, Albert C. Landers; directors: Stillman F. Kelley of North Cambridge, Mass.; William A. Tucker of Boston; Melville Bull of Middletown; A. C. Landers of Newport; A. L. Handy of Tiverton; Lorenzo D. Tallman of Portsmouth; Robert S. Geoff of Fall River; E. L. Saltonstall of Newton, Mass., and E. P. Shaw of Brookline, Mass.

Sault Ste. Marie, Mich.—The Edison Sault Electric Company will build a large power building this summer, increasing its present capacity fully five times and giving it an abundance of cheap power to lease to manufacturing industries that may locate here. The improvements will cost \$75,000 and work will commence soon.

TRANSMISSION PLANTS.

Grafton, W. Va.—A Pittsburg syndicate is negotiating for the purchase of the Valley Flouring Mill property in this vicinity. It is the intention to erect a large electrical power plant. The best water power in the State is located near the desired property.

Pittsburg, Pa.—E. W. Linforth of San Francisco, who has been in this city for several days, stated to a reporter of the "Post" that the 108 mile transmission plant which involves the erection of a dam across the Kern River in Kern County, Cal., was sure of completion. The Kern River, according to Mr. Linforth, drains 2,345 square miles of territory, and the dam that is now under course of construction will give the company a total of about 12,000 horse-power. The voltage of 30,000 proposed for the line is a very high one, but, says Mr. Linforth, the high and dry atmosphere and the infrequent rainfalls warrant its adoption. The electricity generated will be transmitted to Los Angeles and other Southern California cities. The plant will cost in the neighborhood of \$500,000, and the Westinghouse Company, it is expected, will furnish the necessary machinery.

San Francisco.—A special to the "Call" from Fresno says: "The city of Hanford will this week have the proud distinction of being the terminus of the longest electric transmission power system in the world. Power is derived from the north fork of the San Joaquin River and delivered in Fresno, a distance of thirty-six miles from the generating station, and utilized there for light and power purposes. This system has now been extended to Hanford, a distance of thirty-three miles, and there will be utilized for light and various power purposes under a pressure of 19,600 volts. This electric installation is the longest line and the highest voltage

in the world to-day. With the improved machinery in vogue the use of such a high voltage has been made perfectly practicable. In the transmission of this power such a long distance (sixty-nine miles) the theoretical loss is phenomenally low, being only from 10 to 15 per cent., which also includes water-wheel loss at the generating station. Under the improved methods of adjustment of the machinery at the station the power is as well secured to the city of Hanford as it is to Fresno, notwithstanding the fact that Fresno is thirty-three miles nearer the source of power."

Tuscumbia, Ala.—A. F. Walker, a well-known engineer of Atlanta, has been at Mussel Shoals, ten miles above Florence, for several days making surveys for the electric light, heat and power plant projected by a recently organized company composed of a half dozen of Sheffield's most enterprising citizens. It is understood that Mr. Walker is very favorably impressed with the location, and is confident that almost unlimited power can be developed. The purpose of the company is to supply power, light and heat to towns and manufacturing within a radius of 100 miles of Sheffield.

NOTES FROM A CORRESPONDENT.

Albany, N. Y.—The Committee on Electricity, Gas & Water Supply of the Assembly has reported favorably Mr. Striefler's bill requiring gas, light and electric companies which require a deposit from their customers to pay interest at a legal rate on such deposits.—Governor Black has signed Senator Ellsworth's bill which exempts railroad companies from that provision of the corporation law which prevents corporations from incurring liabilities in excess of their paid up stock.—The Assembly has passed Mr. Holbert's bill authorizing municipal officers of cities of the third class to contract for the lighting of streets for a period not exceeding five years.—The West Oneonta and Laurens Railroad Company, with a capital stock of \$750,000, is to build and operate an electric road five miles in length from West Oneonta to Laurens in Otsego county.—Mr. Hatch has introduced in the Assembly a bill amending the stock corporation law to allow an electric light company to also furnish heat and power.

Ballston Spa.—At a meeting of the board of directors of the Ballston Terminal Railroad, Frederick H. Beach was chosen president. An early completion of the road is now expected.

Glens Falls, N. Y.—The Glens Falls, Sandy Hill and Fort Edward Street Railroad Company has decided to double its electric power. The additional buildings will be erected as soon as the frost is out of the ground.

Schenectady.—C. P. Steinmetz of the General Electric works will deliver a lecture on electricity, March 30, before the Historical and Art Society of Albany.—At the banquet of the Board of Trade in this city on the 17th, Edwin W. Rice, Jr., third vice president of the General Electric Company, spoke on "The Industrial Outlook." He said that if the present crisis is passed safely the commercial outlook will be most favorable. He believed that the success of this country lies in the cheapness of raw material, the skill of American workmen and the ability of American manufacturers.

PERSONAL AND MISCELLANEA.

Sir Henry Bessemer, the well-known inventor, whose discovery of a method of converting iron into steel revolutionized the iron trade, died on the 15th inst. at his suburban residence, 165 Denmark Hill, London. He was born in Hertfordshire in 1813.

Otto Kelm, a former employee of the Edison Electric Light Company in New York, has been placed in the Trenton Insane Asylum by the officials of Warren Township, N. J. Kelm is twenty-six years old. He had applied himself to the study of electricity so steadily that it affected his mind, and he became possessed of the hallucination that he was greater than Edison and could make improvements on the latter's inventions.

Lord Sackville Cecil, brother of Lord Salisbury, the English Premier, whose death occurred recently, left a fortune of \$1,250,000, almost entirely of his own earnings. He had an absorbing interest in electricity and was connected with several electrical enterprises. He assisted in the development of the Eastern Telegraph Company and was at one time chairman of the Exchange Telegraph Company.

A press dispatch from Buffalo, N. Y., states that the Boughton Telephotos Company is working day and night to complete a big order for their system of signals to be placed on the United States war vessels. The order came from the Navy Department a few days ago. The telephotos is said to be the most effective night signal known. It consists of four double lanterns hung vertically and lighted by powerful incandescent lamps. The upper half of each lamp is white and the lower half is red. An operator on a ship spells out the signals on a machine similar to a typewriter.

The battleships Kearsarge and Kentucky, now approaching completion at Newport News, Va., will be launched on the 24th inst. The Kearsarge will be christened by Mrs. Winslow, the wife of Lieutenant Commander Winslow, the son of the officer commanding the old Kearsarge in her memorable fight. The Kentucky will be christened by Miss Bradley, the daughter of the governor of Kentucky. Besides the usual electrical equipments, the turrets of these ships will be turned and controlled by electricity—the first instance on so large a scale on any vessel.

The Portland "Oregonian" says: "The prospect is very good for all the ships visiting this port having

their cargoes put on board or unloaded by electricity before long. Capt. J. A. Brown has already several conveyors operated by electricity for putting wheat and flour on board ships. He also has automatic ballast hoists on the Star Sand Company's wharf and at the Gas Company's wharf operated by electricity, by means of which ballast and coal are hauled with great rapidity and automatically dumped in elevated bunkers, so that wagons can be driven underneath and loaded by gravity. He has had electric wires run to a number of wharves so that his conveyors can be used wherever desired. It is quite probable that before long all the wharves will be electrified, and electric motors will have taken the place of the donkey engine in furnishing power for loading and unloading vessels. In the case of ballast ships this, with the elevated bunkers for receiving the ballast, will effect a large saving in the matter of shoveling, wear and tear of docks, etc., and in addition the work will be expedited."

The Pond Lily Company have installed at their works in Westville, Conn., says the New Haven "Leader," "a means of stopping all the machinery of the laundry department by the single touching of an electrical button, which is a big improvement upon the method now in use in some plants of electrically telegraphing the engineer to shut down his engine, or as in other plants of electrically closing the throttle valve of the engine in case of accident. Both of these methods have the defects of the loss of valuable time in actually stopping the machinery, as the momentum of the fly-wheel causes the line shaft to make many revolutions after the engine has been actually shut down, and if a person be caught in any of the belting or machinery, the chances are he or she would be considerably, if not fatally, injured before the machinery actually stopped, but by the new method devised by Harry F. Barnes the main line shaft is disconnected, and there being no balance wheel, with its stored up momentum, to overcome, the shafting and consequently all the machinery stops at once. Any one at all familiar with the operating of machinery, will see how perfectly this 'means to ends' works. It gives the operator on machines freedom from ever present fear, that otherwise inseparably attends the constant working about machinery in action, as each operator knows that by touching a button all the machinery stops at once. The buttons are distributed all about the factory, and to mark their location more quickly are painted a bright red, and also to prevent meddlesome interference, the word 'Danger' is conspicuously placed below the button."

RECENT COMPANY ELECTIONS.

Brush Electric Light & Power Company, Columbus, Ga.—The old officers and directors were re-elected.

Columbia Railway Company, Washington, D. C.—Directors: R. F. Baker, E. G. Davis, R. D. Weaver, Nathaniel Wilson, A. B. Coppes, John Cammack and George W. Moss.

Columbus Railroad Company, Columbus, Ga.—President, John F. Flournoy; vice-president, J. Wainwright; secretary and treasurer, Pierre W. Briggs; superintendent, W. D. Keene; directors: C. B. Grimes, Tol V. Crawford, L. F. Garrard, John F. Flournoy, W. D. Stratton and E. J. Kelly, of New York, and J. Wainwright, of Philadelphia. The same officers and directors were elected for the North Highlands Railroad Company of Columbus.

Greenbush & Nassau Electric Railway Company, Rensselaer, N. Y.—President, W. D. Barnes; treasurer, Thomas W. Cantwell; secretary, Dr. S. C. Curran; superintendent, Fred. Carr; directors: William D. Barnes, Fred. Carr, Thomas D. James, Jared L. R. Davis, George Whitlock, Gardner Morey, Sylvanus C. Curran, Lewis Miller, John Garrison, Joel Morey, Thomas W. Cantwell, W. Cocheu, William Nichols, Warren Fowler, Edwin S. Comstock.

Long Island Electric Railroad Company, Brooklyn, N. Y.—President, A. R. Hart, of Brooklyn; vice-president, Charles A. Porter, of Philadelphia; treasurer, William L. Wood, of Jamaica, N. Y.; secretary, J. C. von Arx, of Brooklyn; directors: Charles A. Porter, Jr., and F. M. Harris, of Philadelphia; A. G. Greenberg and Joseph Horgan of New York, and H. A. Van Allen, of Jamaica.

Petersburg Electric Railway Company, Petersburg, Va.—President, Edward C. White, New York; vice-president, Lloyd Nash, Westport, Conn.; secretary and treasurer, W. P. McKee, Petersburg; directors: the officers and Alexander Hamilton, Petersburg. Negotiations are pending with capitalists in Petersburg and the North looking to rebuilding and re-equipping the road.

Plainfield Street Railway Company, Plainfield, N. J.—President, Thomas Nevins; vice-president, Dr. T. J. Fritts; secretary and treasurer, Adrian Riker; superintendent, John Alderman; directors: Chandler Riker, Thomas Nevins, Jr., Dr. Fritts, M. B. Brown, Thomas Nevins, Sr., Courtland Riker and Adrian Riker.

Worcester & Clinton Street Railway Company, Worcester, Mass.—President, A. S. Paton; vice-president, Jerome Marble; treasurer, Walter R. Dame; directors: Alexander S. Paton, W. S. Reed and George R. Damon of Leominster; Walter R. Dame of Clinton, and Jerome Marble, T. S. Johnson and George A. Flagg of Worcester.

Worcester, Oxford & Webster Street Railway Company, Worcester, Mass. (a new organization).—Directors: J. L. Currier, O. F. Joslin, Albert M. Phillips, William C. Pierce, Leander F. Herrick, H. W. Aiken and C. H. Stratton. Mr. Aiken was chosen temporary chairman and clerk and Mr. Currier temporary treasurer. It was voted to take steps to secure franchises in the several towns.

The General Electric Company owed on January 1, 1898, \$1,339,580 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

COMMERCIAL PARAGRAPHS.

The Beacon Lamp Company of New Brunswick, N. J., the well-known manufacturers of high-grade incandescent lamps, have, we understand, been compelled to increase the capacity of their works owing to several large stations having recently placed contracts with them for their yearly supply of lamps. The excellent quality of the Beacon Company's product can be judged from the fact that the lamps the company have recently been turning out maintain an average candle power for over 300 hours, which is something unprecedented. We are authorized to say that the company will be pleased to furnish free to any prospective purchaser lamps for testing.

Educate Your Bowels With Cascarets.
Candy Cathartic, cure constipation forever.
10c, 25c. If C. C. C. fail, druggists refund money.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

Gould & Eberhardt of Newark, N. J., report having had a gradual, steady growth in business during the past year, and now have a goodly number of orders ahead for their well-known Patented Special Machine Tools, which are fully up to date, some of the machines being away ahead of the present state of the mechanical art.

A Belt Dressing that Prevents Slipping and Preserves the Life of the Leather.

It is the slipping heel that wears the hole in the stocking and it is the slipping belt that wears the leather. Belts that slip not only do not drive properly, but they wear out rapidly. A belt that is too tight is overstrained, and will also wear out rapidly. A thoroughly reliable belt dressing is therefore a necessity in every well regulated factory, and probably no dressing has such a world-wide reputation as Dixon's Belt Dressing and Leather Preservative.

As long ago as 1878 it was used on the big driving belt at the Paris Exposition, when every other means had failed to make the belt take hold of the pulley that was to start the thousands of feet of shafting and hundreds of machines. Those who use Dixon's Belt Dressing claim that it prevents slipping and thoroughly preserves the life and elasticity of the belt. It is made only by the Joseph Dixon Crucible Co., Jersey City, N. J., who are known the world over for their graphite products.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c.
If C. C. C. fail to cure, druggists refund money.

No-To-Bac for fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c. \$1. All druggists.

Dr. Harwood Huntington has been appointed the official chemist of the Wool Exchange, and has moved his laboratory into the Wool Exchange Building, 260 West Broadway, where he has a large and beautifully equipped laboratory. The particular line of work in which this laboratory has done a great deal is the development of waste products, and the form of contract which is generally made with the clients is to take any waste product and make researches on it, and if nothing of practical utility results to make no charge. We feel sure that if this were more generally known among manufacturers of all branches of industry they would be glad to avail themselves of the opportunity offered by this laboratory.

Associated with Dr. Huntington is Dr. William H. Warren, who has had long experience in the manufacturing operations, and has been very successful in the development of new processes and finding applications for waste products.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

INCORPORATIONS.

The Crafton Storage Battery Company, Chicago, Ill.—to manufacture storage batteries. Capital stock, \$25,000. Incorporators: Charles B. Stafford, A. C. Crofton and J. K. Pumpelly.

The American Electrical Novelty & Manufacturing Company, New York. Capital stock, \$25,000. Directors: Conrad Hubert, Maurice Hartman and Joseph Harwich.
